43037 (COGLA–8702A) **Preferred orientation and displacement evacuation system. Appendix.** Leafloor, F.C.; Yeo, G.B. Canada Oil and Las Lands Administration, Ottawa, ON (Canada). 1987. 128p. (CE–02677). Available from Canada Oil and Gas Lands Administration, 355 River Rd., 15th Floor, Tower B, Ottawa, ON, CAN K1A 0E4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Field trials were conducted on the Preferred Orientation and Displacement System (PROD). The PROD system is a response to a recommendation of the Royal Commission on the Ocean Ranger disaster, which stated that utmost priority be given to the development of safe evacuation systems for foreseeable emergency and storm conditions. An essential consideration was to ensure that a lifeboat clear the rig structure during lowering and, upon release, escape from the vicinity of the rig. This second volume gives the chronology of the project, the list of components and auxiliary components of the PROD system, a description of the data acquisition systems and simulation systems, a graphic representation of all sea trials, and a description of the lifeboat recovery and towing systems. 5 refs., 148 figs., 13 tabs.

43038 (DNV/C–48SZ23304-6-5006) **Variability and occurence of offshore winds and waves. Final report.** Maes, M.A. Det Norske Veritas (Canada) Ltd. (Canada). 1986. 122p. (CE–02679). Available from Canada Oil and Gas Lands Administration, 355 River Rd., 15th Floor, Tower B, Ottawa, ON, CAN K1A 0E4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This study consists of two parts. In Part 1, the oceanographic and meteorological databases currently available at the Canadian Climate Centre of Environment Canada are used to produce plots for the coefficient of variation of annual and monthly environmental loads. This parameter is extremely important for the calculation of design risks and is linked to the selection of the environmental load factor in design codes. Extreme wind loads, and wave loads induced by both drag and inertia, are examined for the East Coast, the West Coast, and the Beaufort Sea. In Part 2, the arrival rate of severe storms in the Eastern Canadian offshore is studied. Both wind speed and wave height are used as severity criteria. The hypothesis that the annual and monthly occurrence of storms can be modelled as a Poisson process is examined. The implications of the

applicability of such a model to the calculation of design wave height are discussed. 24 refs., 129 figs., 11 tabs.

43039 (NEI-NO–90) **Experiences with offshore instrumentation.** Norske Sivilingenioerers Forening, Oslo (Norway). 1986. 308p. (In Norwegian). (CONF-8601153–: Experiences with offshore instrumentation, Geilo (Norway), 29-31 Jan 1986). Order Number DE89902379/JAW. Available from NTIS (US Sales Only), PC A14.

Course on experiences with offshore instrumentation, Jan 29-31, 1986, Geilo, Norway.

The collected papers given at a course concerns the experiences gained from the various methods used in the fields of navigation, bathymetry, shallow gas surveying, and pipeline planning on the Norwegian continental shelf. Separate abstracts are prepared for ten papers. 86 figs., 8 refs.

43040 Combined removal of SO_2, NO_x, and fly ash from simulated flue gas using pulsed streamer corona. Clements, J.S. (9521249); Mizuno, A.; Finney, W.C.; Davis, R.H. *IEEE (Institue of Electrical and Electronics Engineers) Transactions on Industry Applications (USA),* 25: 62-69 (Jan 1989).

A pulse-energized electron reactor which utilizes pulsed streamer corona has been developed for the combined removal of SO_2, NO_x, and particles from effluent gases. In the pulse-energized electron reactor process, fast-rising narrow high-voltage pulses are superimposed on a dc-bias voltage and applied to a nonuniform electric field geometry to generate pulsed streamer corona. The pulsed streamer corona produces energetic free electrons, which dissociate gas molecules, forming radicals. These radicals cause chemical reactions that convert SO_2 and NO_x into acid mists and/or solids, which can be removed from the gas stream by conventional means. The pulsed streamer corona also produces ions, and between pulses the ions charge the fly-ash particles, which are then collected by the dc-bias field. In pulse-energized electron reactor performance tests on a humid air stream with an initial SO_2 concentration of 1000 ppm, more than 90 percent of the SO_2 was removed with an advantageously small power requirement. Combined treatment performance was demonstrated by introducing high-resistivity fly-ash into the gas stream. The fly-ash collection efficiency of the pulse-energized electron reactor was significantly better than that of a conventional dc wire-cylinder electrostatic precipitator when the electrodes of both were covered with a high-resistivity layer.

4250 Power Cycles

43041 An example of the manipulation of effective vapor pressure curves by thermodynamic cycles. Radermacher, R. (3946000). *Journal of Engineering for Gas Turbines and Power (USA),* 110(4): 647-651 (Oct 1988).

The performance of a two-stage Rankine cycle employing a working fluid mixture and solution circuits has been computed with reference to heat pump applications. Its performance is compared to the single-stage version of this cycle and of operating with pure refrigerants. It is found that the two-stage cycle operates along an effective vapor pressure curve of very flat slope, resulting in pressure ratios that are reduced to about one third compared to conventional cycles. For large temperature differences between heat sink and source the Coefficient of Performance (COP) can be increased by up to 50 percent.

43 PARTICLE ACCELERATORS

43042 (AECL–9501) **Multiple scattering of electron beam in linac window.** Lee-Whiting, G.E. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jun 1987. 32p. Order Number DE89635425/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The combined effects of the multiple scattering of an electron beam in an accelerator window and in the air between the window and a product being irradiated are calculated in the Gaussian approximation. A method of averaging over the initial distributions of displacement and direction of the beam is formulated. Several approximate treatments, appropriate to different degrees of focusing, are developed for the required phase-space integrations. Particular attention is given to finding computational methods speedy enough for incorporation in a computer program to be used for exploratory design.

43043 (KEK-PR–88-2) **KENS report-7, 1987/88.** Watanabe, N.; Arai, M.; Asano, H.; Endoh, Y. (eds.). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). 1988. 168p. Order Number DE89906588/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

The present issue summarizes the research activities performed at the KENS Facility from September, 1986 to March, 1988. In this issue, the style of the report is improved a little bit to the concise from with two columns. In this period, proton beam intensity was gradually increased, and a beam intensity of 2×10^{12} protons per pulse seemed to come within range. A new data acquisition and processing system was introduced last year, and the construction of a chopper spectrometer INC progressed. The total number of the papers published was about 250. This is the third year of the UK-Japan collaboration on neutron scattering study, and the construction of a chopper spectrometer MARI provided by KEK will be completed in 1990 on the ISIS in Rutherford Appleton Laboratory. A lot of the experiments on high Tc superconductors were proposed, and mostly carried out as a part of B_1 experiments. The future program of the pulsed spallation neutron source KENS-2 was included in the Japanese Hadron Facility Project as an important part of four major fields. The project is now under examination by the government. In the last chapter of this report, the short reports on high intensity proton accelerators are compiled for future reference. The reports in the fields of instrumentation, neutron scattering, structures of liquid and glass, magnetic structure and excitation and others are collected. (K.I.).

43044 (ANL/APS-TM–3, pp. 5-22) **Characteristics of the advanced photon source and comparison with existing synchrotron facilities.** Rivers, M.L. Argonne National Lab., IL (USA). Apr 1988. (CONF-880194–: Workshop on synchrotron X-ray sources and new opportunities in the earth sciences, 18-20 Jan 1988). In *Synchrotron x-ray sources and new opportunities in the earth sciences: Workshop report.* Order Number DE88009858/JAW. Available from NTIS, PC A07/MF A01.

The Advanced Photon Source will provide significant increases in photon intensity over existing synchrotron sources. Undulators will increase the flux in the 3-40 keV range by several orders of magnitude with relatively narrow energy bandwidths. Wigglers and bending magnets will provide much higher flux in the energy range above 40 keV with a smooth energy spectrum. The details of the spectral characteristics of the APS source are discussed, and compared with those of existing US hard x-ray synchrotron storage rings.

43045 Application of accelerators in research and industry '88: Proceedings: Part 1. Duggan, J.L.; Morgan, I.L. (eds.). 734p. North-Holland Physics Publishing, Amsterdam, The Netherlands (1989). Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER40455. From 10. international conference on the application of accelerators in research and industry; Denton, TX (USA); 7-9 Nov 1988.

This book contains papers from the conference on the application of accelerators in research and industry. Topics covered in this volume are: atomic physics and related phenomena; synchrotron experiments; nuclear physics and astrophysics; ion implantation, semiconductors, materials modification; and PIXIE microprobe. (FI)

43046 Application of accelerators in research and industry '88: Proceedings: Part 2. Duggan, J.L.; Morgan, I.L. (eds.). 724p.

North-Holland Physics Publishing, Amsterdam, The Netherlands (1989). Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER40455. From 10. international conference on the application of accelerators in research and industry; Denton, TX (USA); 7-9 Nov 1988.

This book contains papers from the conference on the application of accelerators in research and industry. Topics covered in this volume are: Materials analysis facilities, mass spectroscopy, Rutherford backscattering and channeling nuclear reaction analysis, resonant ionization spectroscopy; accelerator technology, accelerator facilities, RFQ beams, diagnostics, computer control, neutral beams, magnets, ion sources, free electron lasers, components calculations; accelerator production of radioisotopes for medical applications, targets for nuclear research; Radiation processing, irrodiation facilities, high dose calibration, ion optics; activation analysis, detectors, spectrometers, calibration, dose measurements, upsets; Radiography; and Radiation therapy, medical and biomedical application, neurosurgery with ion beams.(FI)

43047 (INIS-mf–11512) **Saskatchewan Accelerator Laboratory. Annual report 1986.** Saskatchewan Univ., Saskatoon, SK (Canada). Saskatchewan Accelerator Lab. 1986. 93p. Order Number DE89635426/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

We have now completed the third year of the upgrading project to convert our conventional linear accelerator to a 300 MeV CW electron beam facility. The original Natural Sciences and Engineering Research Council (NSERC) grant in 1983 was for the following items: an energy compressor to improve the spectrum from the linac, a pulse stretcher ring to give ~ 100% duty cycle, and a modern QDD spectrometer for efficient data taking. The status of all these items and other equipment funded for experiments is discussed in the text of this report. More details on the parameters of the various components may be found in previous annual reports (1984 and 1985). The 1984 report also describes the administrative structure of the project and how the performance of the laboratory is evaluated. Part of that supervisory structure is NSERC's Saskatchewan Advisory Committee. That committee visited the laboratory on 10-11 April 1986 and sent a satisfactory report to the presidents of NSERC and of the University of Saskatchewan. One more visit of this committee is expected at the completion of the project.

43048 (JAERI-M–89-016) **Takasaki Ion beam Implanter (TIBI). Operation and experiments.** Aoki, Yasushi; Nagai, Siro. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1989. 49p. (In Japanese). Order Number DE89906464/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

TIBI (Takasaki Ion Beam Implanter) was installed at Takasaki Radiation Chemistry Research Establishment of JAERI in October 1987 with principal purpose to carry out preliminary studies preceding to the research program for Advanced Radiation Technology (ART) which is now in progress. This implanter can generates various ions from both gaseous and solid materials and accelerate them up to 200 keV. In the irradiation chamber attached to it, samples can be ion-implanted in high vacuum at - 196degC and at different temperature from room temperature to 1250 degC. This report describes in the first place the circumstances until the installation, the outline, the operational procedure, and the safety systems of TIBI and then our results of test for production and acceleration of ions and of preliminary experiments using this implanter. Finally, a view is given of ion implantation to organic polymers. (author).

43049 (LAPP-EXP–88-13) **Superconducting radiofrequency e^+e^- linear collider for bottom quark and nuclear physics studies.** Coignet, G. Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules. Jun 1988. 26p. (CONF-8804290–: International conference on advanced technology and particle physics; 16. international meeting on fundamental physics on CP non conservation and B physics, Como (Italy), 12-17 Jun 1988; 25-29 apr 1988; CONF-8806235–). Order Number DE89791990/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The design of an accelerator complex based on recirculated linacs is presented. It could be used as a b-antib hadron factory and simultaneously it could provide nearly continuous beams for Nuclear Physics studies. The expected performances of this accelerator are given. The main components and the associated developments are mentioned. The characteristics of the associated detector requested to perform an original b-antib physics program are also listed. Finally, possible extensions offered by the accelerator complex are presented.

43050 (LBL–25962) **184-inch Synchrocyclotron decommissioning.** Reimers, D.; Haley, J.; Hampton, G. Lawrence Berkeley Lab., CA (USA). Mar 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–244: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE89016344/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

SYNCHROCYCLOTRONS/decommissioning; SYNCHROCYCLOTRONS; DECOMMISSIONING; SAFETY; WASTES

43051 (PB–89-179311/XAB) **Superconducting structures for the acceleration of heavy ions up to 0.5c. Final report.** Delayen, J.R. Applied Superconductivity, Inc., Altadena, CA (USA). Oct 1986. 46p. Available from NTIS, PC A03/MF A01.

The higher the velocity of the ions a particular structure is designed to accelerate, the larger the number of that structure will be installed in an accelerator. Therefore, as the velocity increases it becomes more and more important to optimize the design of the resonator to provide the highest voltage gain with the smallest combination of operating and construction costs. Researchers have developed a set of procedures that allow optimization of the design with respect to the actual properties of superconducting surfaces. These procedures have been found to be very accurate in predicting the electromagnetic properties of low-velocity resonators. They also produce an optimized design, where the various loss mechanisms are balanced, by making use of the practical nonlinear properties of superconducting surfaces.

43052 **Superconducting magnet system.** Dahl, P. (Brookhaven National Laboratory, Upton, NY 11973 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA)*, 184(2): 1327-1376 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

The superconducting magnet system for the superconducting super collider is described. A design scheme considering magnet load line, central field and saturation, multipoles, inductance, stored energy and leakage field, and superconductor magnetization is presented. The niobium titanium superconductor is described coils, iron yoke and helium containment, beam tube assembly, quench protection features, the cyrostat, magnet testing, the quadrapoles, and other magnets are described.

43053 **Radio-frequency acceleration.** Puglisi, M. (Sincrotrone Trieste (IT)). *AIP (American Institute of Physics) Conference Proceedings (USA)*, 184(2): 1393-1476 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

In contrast to the early days of cyclic and linear RF accelerators, modern high beam currents and performance parameters require very sophisticated and expensive RF accelerating systems. This work is a schematic presentation of current RF acceleration technology. Because of time limitations this treatment will be based simply on drawings and schematic comments. (AIP)

43054 **Overview of the advanced photon source.** Moncton, D. E. (Advanced Photon Source, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Crosbie, E.; Shenoy, G. K. *Review of Scientific Instruments (USA)*, 60(7): 1403-1405 (Jul 1989).

The Advanced Photon Source planned for construction at Argonne National Laboratory is based on a low-emittance storage-ring operated at 7 GeV and capable of providing tunable undulator radiation from 4 to 40 keV (using the first and the third harmonics). A technical description of the accelerator facility and the storage ring is presented in this overview, along with a brief summary of the characteristics of radiation that will be available from the insertion devices. Various plans for user access to this national user facility are also given.

43055 Plasma acceleration of particle beams. Katsouleas, T. (University of California, Los Angeles, CA 90024 (US)); Dawson, J. M. *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1798-1829 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

Plasmas, being fully ionized gases, are immune from electrical breakdown and so can support ultra-high accelerating fields (order GeV/cm) in the form of relativistic plasma waves. Several schemes to excite these waves and use them for particle acceleration are reviewed in this article. These include the beat wave accelerator (laser driven) and the plasma wakefield transformer (particle beam driven). In addition, the possible use of plasmas to provide strong final focusing of beams (the plasma lens) is described.

43056 Introduction. Edwards, D. A. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1830-1844 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

A brief overview of major component design decisions for the Fermilab Tevatron due to available technology are presented. Components of the Tevatron discussed here are the superconducting magnets, cryogenics, the power system and quench protection, and the vacuum system. Other decisions concerning the development of the fixed-target design and the transformation to collider are considered. (AIP)

43057 Detection and compensation of transverse resonances. Gerig, R. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1928-1940 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

This article considers the techniques used to identify and compensate nonlinear errors in the magnets of a circular accelerator. The design of a corrections system and the way in which it is used are also described. Finally, a simulation is described in which the emphasis is on reproducing the results that are observed while measuring and compensating resonance lines. We have found that correction of the resonance lines in the simulation is successful whereas compensation in the real machine is only partially successful. Attempts are being made to enhance the model in order to better simulate the behavior of the Main Ring of the Fermilab Tevatron. (AIP)

43058 Longitudinal phase space in circular accelerators. Martin, P. S. (Fermi National Accelerator Laboratory, Batavia, IL 60510 (US)); Ohnuma, S. *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1941-1968 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

This paper is a primer on the longitudinal phase space in circular accelerators which was presented at the 1987 U.S. Particle Accelerator School at Fermilab. First definitions are given, then beam and bucket parameters are discussed and the two frequency case and bunch coalescing are reviewed. (AIP)

43059 Design and operation of the quench protection system for the fermilab tevatron. Martin, P. S. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2073-2097 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

This is a discussion about the quench protection system for the Main Tevatron superconducting magnet system. We present a brief discussion of the basic properties of superconductors and the phenomenon of quench propagation. Operational characteristics of quenching phenomenon in the Tevatron magnets are presented. (AIP)

43060 Science in the age of accelerators. Perl, M. L. (Stanford Linear Accelerator Center, Stanford, California 94305 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2098-2115 (5 Apr 1989). DOE Contract AC03-76SF00515. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

A brief illustration of how science has developed along with how accelerator technology and accelerators have developed and have become a part of science is presented. The author has traced the intertwining of the private and public worlds of science with the coming of age of particles accelerators. (AIP)

43061 Accelerator projects, worldwide. Teng, L. C. (Fermi National Accelerator Laboratory, Batavia, Illinois 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2116-2126 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

In this paper there is a description of worldwide accelerator projects in two principal categories, i.e., high energy colliders (the pursuit of high energies or small dimensions for particle physics studies is the initial and basic motivation for the development of accelerators) and high intensity, medium energy accelerators (machines of this category are useful for both particle and nucleon physics research). (AIP)

43062 Induction accelerators and free-electron lasers at LLNL. Briggs, R. J. (Lawrence Livermore National Laboratory, Livermore, California 94550 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2183-2207 (5 Apr 1989). DOE Contract W-7405-ENG-48. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

Linear induction accelerators have been developed to produce pulses of charged particles at voltages exceeding the capabilities of single-stage, diode-type accelerators and at currents too high for rf accelerators. In principle, one can accelerate charged particles to arbitrarily high voltages using a multi-stage induction machine. The advent of magnetic pulse power systems makes sustained operation at high repetition rates practical, and high-average-power capability is very likely to open up many new applications of induction machines.

43063 Synchrotron radiation A general overview and a review of storage rings, research facilities, and insertion devices. Winick, H. (Stanford Synchrotron Radiation Laboratory, Stanford, CA 94309 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2138-2182 (5 Apr 1989). DOE Contract AC03-82ER13000. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

Synchrotron radiation, the electromagnetic radiation given off by electrons in circular motion, is revolutionizing many branches of science and technology by offering beams of vacuum ultraviolet light and x rays of immense flux and brightness. In the past decade there has been an explosion of interest in these applications leading activity to construct new research facilities based on advanced storage rings and insertion device sources. Applications include basic and applied research in biology, chemistry, medicine, and physics plus many areas of technology. In this article we present a general overview of the field of synchrotron radiation research, its history, the present status and future prospects of storage rings and research facilities, and the development of wiggler and undulator insertion devices as sources of synchrotron radiation.

43064 Supercollider physics. Quigg, C. (SSC Central Design Group, Lawrence Berkeley Laboratory, Berkeley, California 94720 USA (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2255-2279 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

My order of business will be to summarize the microscopic description to which we have come in the past twenty years. I will review the evidence for quarks and leptons as fundamental constituents and explain the strategy of gauge theories of the fundamental interactions. Next, I will discuss questions the Standard Model raises but cannot answer. We can define a frontier where out current understanding ceases to make senese, where the clues that will lead us to a more satisfying description of nature will have to be

found. That frontier lies at energies of about 10^{12} electron volts for collisions among the fundamental constituents. The instrument of choice for reaching this new energy scale is a high-energy, high-luminosity, proton-proton collider. I will conclude by summarizing the status of the American project known as the Superconducting Super Collider, or SSC. (AIP)

43065 Particle accelerators and discoveries in elementary particle physics. Jones, L. W. (Randall Laboratory of Physics, University of Michigan, Ann Arbor, Michigan 48109-1120 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA)*, 184(2): 2280-2299 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

Some discoveries in elementary particle physics are recounted from personal and historical perspective with particular reference to their interaction with particle accelerators. The particle examples chosen include the ψ/J, the Υ, and the study of nucleon constituents with inelastic electron scattering. Precursors experiments are cited together with the better known discoveries.

43066 Progress on next generation linear colliders. Ruth, R. D. (Stanford Linear Accelerator Center, Stanford University, Stanford, CA 94305 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA)*, 184(2): 2208-2226 (5 Apr 1989). DOE Contract AC03-76SF00515. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

The purpose of this paper is to review progress in the U.S. towards a next generation linear collider. I will focus on reviewing the issues on progress on a next generation linear collider with the following general parameters: energy, 0.5–1.0 TeV in center-of-mass; luminosity, 10^{33}–10^{34} cm^{-2} sec^{-1}; length, each linac$\lesssim$3 km; power, $\lesssim$100 MW per Linac; technology, must be realizable by 1990–92. (AIP)

4302 Beam Dynamics, Field Calculations, and Ion Optics

43067 (BNL–42954) **Tangent map analysis of the beam-beam interaction.** Lee, S.Y.; Tepikian, S. Brookhaven National Lab., Upton, NY (USA). 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-890594–4: 3. advanced inertial confinement fusion accelerator beam dynamics workshop: beam-beam effects in circular colliders, Novosibirsk (USSR), 20 May - 3 jun 1989). Order Number DE89015857/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We studied the tangent map of the beam-beam interaction and found no evidence of beam-beam instability for $\epsilon = 0.04$. Tracking study with tune modulation shows however large emittance growth due to the sum resonances. The emittance growth is due to the multiple crossing of the sum resonances. 12 refs., 7 figs.

43068 (CONF-881049–75) **NIST–Los Alamos racetrack microtron status.** Wilson, M.A.; Ayres, R.L.; Cutler, R.I.; Debenham, P.H.; Lindstrom, E.R.; Mohr, D.L.; Penner, S.; Rose, J.E.; Young, L.M. National Inst. of Standards and Technology, Gaithersburg, MD (USA); Los Alamos National Lab., NM (USA). 1988. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AI01-87ER40332;W-7405-ENG-36. From 14. linear accelerator conference (LINAC-14); 3-7 Oct 1988. Order Number DE89016083/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The NIST-Los Alamos Racetrack Microtron (RTM) is designed to deliver a low-emittance electron beam of up to 0.5 mA cw over an energy range of 17 MeV to 185 MeV. Fed by a 5 MeV injector, the RTM contains two 180° end magnets that recirculate the beam up to 15 times through a 12 MeV RF linac. The linac, which operates in a standing-wave mode at 2380 MHz, has been tested to nearly full RF power. At present, the injector has undergone beam tests, and the beam transport system is complete through the 12 MeV linac. A temporary beam line has been installed at the exit of one end magnet to measure the beam energy, energy spread, and emittance after one pass through the accelerator. Preliminary results indicate that the accelerated beam energy spread and emittance are within design goals. 4 refs., 7 figs.

43069 (FNAL/C–89/137) **Finite difference time domain modelling of particle accelerators.** Jurgens, T.G.; Harfoush, F.A. Fermi National Accelerator Lab., Batavia, IL (USA). Mar 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890335–237: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE89015242/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Finite Difference Time Domain (FDTD) modelling has been successfully applied to a wide variety of electromagnetic scattering and interaction problems for many years. Here the method is extended to incorporate the modelling of wake fields in particle accelerators. Algorithmic comparisons are made to existing wake field codes, such as MAFIA T3. 9 refs., 7 figs.

43070 (FNAL-TM–1612) **An algorithm to calculate the beam momentum distribution from flying wire profiles.** Wang, X.Q. Fermi National Accelerator Lab., Batavia, IL (USA). 27 Jul 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. Order Number DE89015587/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Horizontal flying wire measurements give beam profiles from which information about the beam momentum distribution and betatron distribution can be extracted. When calculating these beam characteristics in the past, for the matter of simplicity, the beam has been assumed Gaussian. For beam profiles which may not be Gaussian, an algorithm to obtain the general beam momentum distribution is developed using the Fourier transform to the beam profiles. Since the profile is the convolution of the momentum distribution and the betatron distribution, using a Fourier transform method makes calculations easier. 6 figs.

43071 (INIS-SU–103/A, pp. 9-11) **On the nonlinear theory of electromagnetic wave scattering on dense relativistic electron beams.** Kuzelev, M.V. (AN SSSR, Moscow (USSR). Inst. Obshchej Fiziki); Panin, V.A.; Plotnikov, A.P.; Rukhadze, A.A. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Quantum radiophysics. Collection.* Order Number DE89012203/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 12.

Nonlinear stabilization of three-wave processes in systems with dense relativistic direct beams is studied. Using expansion of constitutive equations in terms of trajectory and electron pulse perturbations analytical solutions for interacting wave amplitudes and instability saturation time are derived. Decay with increased frequency and explosion process are considered. 10 refs.

43072 (INIS-SU–103/A, pp. 12-14) **On the mechanism of nonlinear saturation of the kinetic beam instability under anomalous Doppler effect.** Kuzelev, M.V. (AN SSSR, Moscow (USSR). Inst. Obshchej Fiziki); Romanov, R.V.; Rukhadze, A.A. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Quantum radiophysics. Collection.* Order Number DE89012203/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 12.

Analytical nonlinear theory of the wave radiation by a hot direct electron beam in a constant external magnetic field with instability under anomalous Doppler effect is presented. The nature of instability stabilization mechanism is stated, maximum wave amplitudes are determined, their dynamics is studied. 4 refs.; 2 figs.

43073 (INIS-SU–103/A, pp. 56-58) **Dynamics of a REB in an external magnetic field.** Nauryzbaev, A.E. (AN SSSR, Moscow (USSR). Inst. Obshchej Fiziki). AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. Kratkie soobshcheniya po fizike.; no. 12.

Results of numerical simulation of quasistationary REB dynamics in a solid gas, the external longitudinal magnetic field being given, are presented. Radial dynamics of axially-symmetric quasistationary

self-focusing REB in a circular tube filled with solid gas in totally defined by intrinsic self-consistent and external longitudinal magnetic fields and by electron scattering in a gas. In case of a strong magnetic field, high isotropic beam heating without its sufficient spread is observed. For a case of strong electron scattering the calculated values of radius and REB transverse temperature variations, depending on the propagation distance, are obtained. Consideration corresponds to REB injection from the magnetized cathode. The obtained results are compared with solution of an envelope equation. 8 refs.; 2 figs.

43074 (LBL–25988) **Emittance at the superHILAC and the Bevalac transfer line.** Krebs, G..F.; Kalnins, J.G.; Abinante, M.S.; Alonso, J.R.; Feinberg, B.; Fowler, K.; Guggemos, J.; Staples, J.; Thatcher, R.; Zajec, E. Lawrence Berkeley Lab., CA (USA). Mar 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–238: 13. particle accelerator conference, 20-23 Mar 1989). Order Number DE89015336/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The SuperHILAC (SHILAC) accelerator serves as a heavy-ion injector to the Lawrence Berkeley Laboratory's Bevalac via a 260 m transport line. Since the acceptance, and hence the final extracted beam intensity of the Bevalac is very sensitive to the emittance and dispersion of the beam at injection, a program was undertaken to accurately characterize these parameters under a variety of operating conditions. 7 figs.

43075 (LBL–27351) **A symplectic coherent beam-beam model.** Furman, M.A. Lawrence Berkeley Lab., CA (USA). May 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890594–3: 3. advanced inertial confinement fusion accelerator beam dynamics workshop: beam-beam effects in circular colliders, 20 May - 3 jun 1989). Order Number DE89015386/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We consider a simple one-dimensional model to study the effects of the beam-beam force on the coherent dynamics of colliding beams. The key ingredient is a linearized beam-beam kick. We study only the quadrupole modes, with the dynamical variables being the 2nd-order moments of the canonical variables q, p. Our model is self-consistent in the sense that no higher order moments are generated by the linearized beam-beam kicks, and that the only source of violation of symplecticity is the radiation. We discuss the round beam case only, in which vertical and horizontal quantities are assumed to be equal (though they may be different in the two beams). Depending on the values of the tune and beam intensity, we observe steady states in which otherwise identical bunches have sizes that are equal, or unequal, or periodic, or behave chaotically from turn to turn. Possible implications of luminosity saturation with increasing beam intensity are discussed. Finally, we present some preliminary applications to an asymmetric collider. 8 refs., 8 figs.

43076 (NIIEFA-P-E–0768) **Damping radial betatron oscillations of electrons in the Erevan synchrotron.** Belov, V.P.; Makarov, A.A.; Martirosyan, G.A. and others. Nauchno-Issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR). 1988. 33p. (In Russian). Order Number DE89635428/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Effect of raiation and its quantum fluctuations on particle dynamics in the Erevan synchrotron at different modes of operation of synchrotron power supply system and different extracted beam energies is considered. Problems of compensation of radial oscillations build-up: in the scattering field of low-aperture magnets of a damping device and in the working range of full-aperture permanent gradient magnets, are presented. Disturbances introduced by a damping device to particle dynamics are considered. The device manufacturing and set-up tolerances are formulated. 4 refs.; 2 figs.; 2 tabs.

43077 (ORNL/FTR–3322) **[Meeting of senior members of the CERN WA80 and NA35 collaborations, Frankfurt, W. Germany, and help write a joint letter of intent proposing a joint experiment to be performed when lead beams become available at CERN, Geneva, Switzerland, June 28–July 4, 1989]: Foreign trip report.** Plasil, F. Oak Ridge National Lab., TN (USA). 15 Jul 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89015321/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The traveler participated in a meeting of the senior members of the CERN WA80 and NA35 collaborations, held June 28–30, 1989, in Frankfurt, FRG. The purpose of the meeting was to produce a joint letter of intent, indicating a joint interest in proposing an experiment to be performed when beams of heavy projectiles, such as lead, become available at the CERN SPS. After several ups and downs, the two collaborations agreed to merge and agreed that the measurement of direct photons and tracking in a time-projection chamber (TPC) are to be the two principal goals of the new collaboration. A fairly detailed letter of intent was drafted. The traveler visited the WA80 and NA35 experiments at CERN. The WA80 experiment is in the process of being moved and/or modified. Measurements of the NA35 vertex magnet were made.

43078 (SLAC-PUB–5021) **Requirements and limitations on beam quality in synchrotron radiation sources.** Cornacchia, M. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8904228–3: CERN accelerator school, Chester (UK), 6-13 Apr 1989). Order Number DE89013987/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The requirements and limitations of the third generation of synchrotron radiation facilities are reviewed. These machines are designed to emit radiation of very high intensity, extreme brightness, very short pulses, and laserlike coherence. These performance goals put severe requirements on the quality of the electron or positron beams. Phenomena affecting the injection process and the beam lifetime are discussed. Gas desorption by synchrotron radiation, collective effects (coupled bunch oscillations) and ion trapping (for an electron beam) play an important role. Low emittance lattices are more sensitive to quadrupole movements and at the same time, in order not to lose the benefits of high brilliance, require tighter tolerances on the allowed movement of the photon beam source. 22 refs., 9 figs.

43079 (UCRL–99782) **Optical Cerenkov measurements of emittance growth in the ATA beam under laser ion-guiding.** Chong, Y.P.; Deadrick, F.J.; Hirzel, D.G.; Kallman, J.S.; Lee, P.; Poulter, J.F.; Rivera, W.E.; Stephan, P.L.; Weir, J.T. Lawrence Livermore National Lab., CA (USA). 1989. 18p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. (CONF-890335–239: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE89016656/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A new beam profile diagnostic using optical Cherenkov radiation from a quartz foil has been deployed at the Advanced Test Accelerator (ATA) at Lawrence Livermore National Laboratory. Quartz has been found to perform better than previously tested foils (titanium and Kapton) in terms of damage threshold. The emission intensity from quartz is over an order of magnitude brighter than that from graphite foil. Data were taken at the beginning, middle, and end of ATA, i.e., at 3.8 MeV (cell 15), 22.5 MeV (cell 90), and 43 MeV (11 m beyond the end). Profile measurements of the ion-focused beam showed emittance growth through the pulse. Double-Gaussian fits to the radial profile were often superior to single-Gaussian fits and showed that a large beam dominated the second half of the pulse. This was observed for currents of 1, 3, and 7 kA at the accelerator output and at cell 15 for the 3-kA case. The dependence of emittance growth on several parameters was studied. 7 figs.

43080 A study of heavy-ion beams during longitudinal compression using particle simulation. Ho, D.D.M. (Lawrence Livermore National Lab., CA (USA)); Brandon, S.T. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands)*, 278(1): 182-185 (15 May 1989). DOE Contract W-7405-ENG-48. (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

Particle simulations show that during longitudinal compression there is little growth in beam longitudinal and transverse emittance. Both longitudinal and transverse temperatures follow adiabatic laws. The compressed beam has negligible longitudinal momentum

spread and therefore can satisfy stringent requirements for final focusing. (orig.).

43081 Development of 3D simulations for heavy-ion fusion beam transport and compression problems. Mark, J.W.K. (Lawrence Livermore National Lab., CA (USA)); Friedman, A.; Chang Chialie; Drobot, A.; Mankofsky, A.; Faltens, A. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 186-190 (15 May 1989). DOE Contract W-7405-ENG-48. (CONF-8806101--: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

Longitudinal beam compression and the possibility of concurrent pulse shaping have been the subject of previous studies using analytical methods and 1D and 2D codes. Here we report on a code development effort to study 3D beam transport in quadrupoles and final compression of a drifting heavy-ion beam pulse. As part of this effort we are making improvements to the ARGUS particle-in-cell (PIC) code to investigate 3D effects of magnetic quadrupole beam transport. A system with magnetic-quadrupole focusing fields is realistically three-dimensional. Although magnetic quadrupoles are expected to be an integral part of much of the heavy-ion accelerator driver, the restrictions due to space-charge modifications of the beam are particularly acute during final compression and focusing, and so we concentrate on this stage. Our initial preliminary benchmarking runs are presented. (orig.).

43082 Transverse misalignments in a driver. Smith, L. (Lawrence Berkeley Lab., CA (USA)); Hahn, K. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 191-193 (15 May 1989). DOE Contract AC03-76SF00098. (CONF-8806101--: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

The transverse errors of the beam lines are usually corrected by an appropriate feedback to bring the beam back on axis. In an induction linac, however, the head and tail of the bunch differ substantially in momentum at a given lens location. As a result, the correction has to be time-dependent. Such a correction becomes increasingly difficult as the beam energy increases and the time duration of the bunch decreases. As a step towards an understanding of the problem, we have analyzed the extreme case of applying no correction. Since the lattice configuration changes and the transverse oscillations are damped as the ions are accelerated, the rms amplitude does not increase simply as the square root of the number of periods, as one would expect for constant velocity in a uniform channel. (orig.).

43083 Final focusing and enhanced disruption from an underdense plasma lens in a linear collider. Chen, P. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309 (US)); Rajagopalan, S.; Rosenzweig, J. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 923-926 (1 Aug 1989). DOE Contract AC03-76SF00515;W-31-109-ENG-38.

In this work we examine the viability of employing an underdense plasma lens as a final focusing method for a linear e^+e^- collider. The underdense plasma lens is superior to the overdense lens in that it improves focusing linearity and background event rate, but works well only for electrons. We thus consider the interaction of an e^- beam which is smaller than the e^+ beam at collision, a case we term "bootstrap disruption." The potential luminosity enhancement is determined by analysis of the lens optics and simulation of the bootstrap disruption.

43084 A compendium of computer codes used in particle accelerator design and analysis. Los Alamos Accelerator Code Group. *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1137-1326 (5 Apr 1989). (CONF-8707208--: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

We present a compilation of computer codes used in the design and analysis of particle accelerators. This document describes each code on a one- or two-page data sheet. All codes included in this compilation are filed at Los Alamos. (AIP)

43085 Fundamentals of intense relativistic electron beams. Miller, R. B. (TITAN Technologies, Albuquerque, New Mexico (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1729-1758 (5 Apr 1989). (CONF-8707208--: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

An intense charged particle beam can be characterized as an organized charged particle flow for which the effects of beam self-fields are of major importance in describing the evolution of the flow. Research employing such beams is an important field with applications ranging from the development of high power sources of coherent radiation to inertial confinement fusion. In this series of intense beam transport in a variety of situations of practical importance. We first present a brief summary of the development of the pulse power technology which is often used to generate these beams, followed by an elementary description of intense beam behavior based on single-particle beam envelope equations. We then describe in some detail the behavior of intense beams in high-voltage diodes, and the important processes involved in beam transport in vacuum, in plasma, and in neutral gas. Much of this material is taken from by book, "An Introduction to the Physics of Intense Charged Particle Beams" (Plenum, 1982), which may be consulted for more information and references.

43086 Application of pulse power technology to ultra high energy electron accelerators. Nation, J. A. (Laboratory of Plasma Studies and School of Electrical Engineering, Cornell University, Ithaca NY 14853, U.S.A. (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1759-1775 (5 Apr 1989). (CONF-8707208--: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

In this lecture we have presented a brief overview of the potential uses of pulse power technology for the development of new high energy electron accelerators. The recent developments in production of ultrahigh power coherent rf sources is encouraging and could well find immediate application in new high gradient accelerators. Pulse power technology, especially magnetic switching, provides a very good match to the driver requirements, although longer duration pulse power source would be useful.

43087 Coherence and statistical properties of photon beams with application to the free-electron laser. Bhattacharjee, A. (Department of Applied Physics, Columbia University, New York, New York 10027 (US)); Gjaja, I. *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1776-1797 (5 Apr 1989). (CONF-8707208--: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

In this paper, we review the theory of coherence and statistics of photon beams in general, with application to the FEL in particular. As far as the general theory is concerned, this paper may be regarded as a poor man's version of existing wisdom in quantum optics. The attempts here has been to distill the existing principles in a compact, self-contained way that will enable one to use them for a light source such as the FEL, which is the application of interest in this paper. If the paper succeeds in generating some interest on quantum optics FEL's and in FEL enthusiasts for quantum optics, it will have served its purpose.

43088 A comparison of the dielectric and plasma wakefield accelerators. Keinigs, R. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)); Peter, W.; Jones, M. E. *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1872-1879 (Sep 1989).

A comparison of two advanced accelerator concepts, the plasma wakefield accelerator (PWA) and the dielectric wakefield accelerator (DWA), is presented. Emphasis focuses on the peak accelerating gradients and transformer ratios that can be achieved in these two devices. The effect of finite plasma size on the PWA is also analyzed. For the same cavity geometry and drive beam current, it is found that the dielectric wakefield accelerator can generate a peak field that is comparable to the field that can be generated in the plasma wakefield accelerator. Provided that ideal beam pulse shaping can be achieved, the transformer ratio for the PWA is ten times larger than that for the DWA. A change in this ideal pulse shape results in closer agreement for the transformer ratios. Given these encouraging preliminary results for the DWA it is concluded that the simplicity of employing a passive structure as an accelerating

medium warrants further experimental testing of the dielectric wake-field accelerator.

43089 Primer on beam dynamics in synchrotrons. Teng, L. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1878-1909 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

An introductory lesson on the beam dynamics in a synchrotron is presented. We first consider intensity-independent dynamics (single particle dynamics) and then intensity-dependent dynamics are discussed. (AIP)

43090 Longitudinal instabilities and stability criteria. Ng, K. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1969-2008 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

This paper is a short course on longitudinal instabilities and stability requirements for particle beams of circular accelerators which was presented at the 1987 U.S. Particle Accelerator School at Fermilab. The discussion includes criteria for longitudinal instability, stability limits, a longitudinal impedance estimation, a wire measurement (simulation) experiment, and results of an experiment to measure impedance by debunching. (AIP)

43091 Emittances through the Fermilab accelerator chain. Finley, D. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1910-1927 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

In this discussion we describe the development of the proton beam emittance through the Fermilab accelerator chain from the 750-keV pre-accelerator to the Tevatron. The measurements given here were taken during late 1984 and early 1986. They indicate there were some sources of emittance increase. Since that time, some improvements have been made and others are planned." (AIP)

43092 Beam loss. VanGinneken, A. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)); Edwards, D.; Harrison, M. *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2033-2072 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

This paper presents results from simulations of beam losses during the operation of a superconducting accelerator. The calculations use a combination of hadron/electromagnetic cascade plus elastic scattering codes with accelerator tracking routines. These calculations have been used in conjunction with the design of the Fermilab Tevatron.

43093 Technology and particle beams. Hartill, D. L. (Cornell University (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2127-2137 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

This paper presents a brief survey of current uses for particle beams. Medicinal uses, synchrotron radiation sources, and materials modification by particle beams are discussed. (AIP)

43094 (AECL–9431) **Gyrotrons. Present status and future prospects.** Ebrahim, N.A. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. May 1987. 36p. Order Number DE89635435/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The purpose of this study is to bring together some relevant ideas and developments in the field of gyrotrons. The development of the electron cyclotron resonance maser (ECRM or Gyrotron) was an important break through in microwave electronics in the 1970s. As we look to the 1980's, we find scientists channelling their collective efforts to shorten the wavelength and increase output power and efficiency, thereby yielding an important device for generating high power microwave radiation. 24 refs.

43095 (AECL–9519) **Computer simulations of cryogenic linear accelerator structures.** Tran Ngoc, T.; Labrie, J.-P. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Sep 1987. 33p. Order Number DE89635436/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Cryogenic linear accelerator structures have high rf efficiency due to reduced resistivity and high heat transfer capability from the boiling heat transfer regime. Finite-element transient heat transfer and thermal stress analysis is used to simulate the behaviour of linear accelerator structures during quenching and predict their characteristics during power operation. 21 refs.

43096 (ANL/APS-TM–3, pp. 23-24) **Modular system.** Argonne National Lab., IL (USA). Apr 1988. Members of the Earth and Planetary Sciences community plan to use the APS facility for a variety of applications. Each type of beam line described in the previous chapter offers a set of properties that are valuable for several applications. Therefore, each beam line will need to serve several different experiments. In addition many of the experiments will need more than one type of radiation. As a result, flexibility will be extremely important to the success of the program. In order to provide the required flexibility, we propose a system consisting of modules. Each module will be a rack on which there will be mounted all of the necessary instrumentation for a particular type of experiment. It will be designed so that it can be moved by crane from one beam line hutch to another or from staging area to beam line hutch and back. Each beam line, in turn, will be equipped to receive any of the various modules. There will be a simple arrangement for indexing each module on each beam line so that a minimum of alignment will be necessary when a module is installed. An example of a module would be an energy dispersive x-ray diffraction system consisting of adjustable fine slits, a sample mounting system with computer-driven translational and orientational alignment capabilities, telescopes for alignment, solid state detector, multichannel analyzer, computer, and the associated power supplies and electronics. Such a module would be suitable for high pressure-temperature diamond cell studies.

43097 (BNL–42947) **Magnetic measurements of permanent magnet insertion devices at the BNL-NSLS [Brookhaven National Laboratory–National Synchrotron Light Source].** Solomon, L.; Decker, G.; Galayda, J.; Kitamura, M. Brookhaven National Lab., Upton, NY (USA). 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-890335–241-Vugraphs: 13. particle accelerator conference, 20-23 Mar 1989). Order Number DE89016408/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Since June 1988, three permanent magnet insertion devices of the hybrid type have been installed into the x-ray ring at the National Synchrotron Light Source at Brookhaven National Lab. as part of the Phase II facility upgrade. The three magnets consist of a soft x-ray undulator (SXU) and two hybrid wigglers, with peak fields of 0.35 and 1.2 Tesla respectively. The SXU magnet has iron poles, samarium cobalt permanent magnets, 80mm period length, 77 poles, and a gap range of 31–100 mm. For this gap range the undulator parameter K, where $K = 0.934\ B(\text{Tesla})\lambda(\text{cm})$, ranges from 2.6 to 0.15. The hybrid wigglers have vanadium pomander poles, samarium cobalt magnets, 120MM periods, 31 poles, and a gap range of 22–122mm. For this gap range K ranges from 13.0 to 0.5. All three of these magnets have electromagnetic coils which can be powered to adjust the value of the magnet field integral. Both point and integral magnetic measurements were performed on these magnets; some of the measurement results will be presented in this paper.

43098 (CONF-881049–74) **Performance of the high power rf system for the NIST–Los Alamos racetrack microtron.** Cutler,

R.I.; Young, L. National Inst. of Standards and Technology, Gaithersburg, MD (USA); Los Alamos National Lab., NM (USA). 1988. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AI01-87ER40332;W-7405-ENG-36. From 14. linear accelerator conference (LINAC-14); 3-7 Oct 1988. Order Number DE89016082/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The high power RF system of the NIST-LANL RTM has been tested at nominal full power levels and has accelerated electron beams successfully. RF stability and calibration measurements have been made using the accelerated electron beam. These measurements have been used to calculate the effective shunt impedance of the side- coupled accelerator structure. RF stability measurements were also performed using power meters and phase detectors. 7 refs., 4 figs.

43099 (CONF-890703–14) **Emittance characteristics of negative ion beams generated by the sputter technique.** Alton, G.D. Oak Ridge National Lab., TN (USA). 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From International conference on ion sources; Berkeley, CA (USA); 9-15 Jul 1989. Order Number DE89015866/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Average emittance data for ion beams extracted from cesium-sputter negative ion sources equipped with spherical, ellipsoidal, and cylindrical geometry cesium-surface ionizers are presented. The attributes of the respective source geometries are described in terms of their cesium ion optical properties. The results of recent measurement of the emittances of momentum-analyzed beams extracted from the ellipsoidal geometry source are also presented. These measurements indicate the presence of a species-dependent effect. The effect is believed to be attributable to differences in the energy spreads of the respective negative ion beams introduced by the sputter generation process. 11 refs., 8 figs.

43100 (IFVE-ONF–88-26) **Minimal software package for operations with the CAMAC/SUMMA modules using the AKK-196 microcomputer.** Kozelov, A.V.; Lebedev, A.A.; Medved', S.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1988. 4p. (In Russian). Order Number DE89635437/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Software interface for operation with CAMAC/SUMMA modules, used in the system of automation of beam monitoring in labelled neutrino complex is discribed. Independent crate controller ACC-196 with builtin microcomputer on the microprocessor set base of 1801 series is used in the system. The package is composed of 8 subprograms. 8 refs.

43101 (IFVE-OUNK–88-132) **On-line system to measure magnetic characteristics of steel samples.** Antonichev, G.M.; Afanas'ev, O.V.; Dubasov, Yu.B. and others. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1988. 8p. (In Russian). Order Number DE89633443/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Submitted to the journal Prib. Tekh. Ehksp.

Using on-line system, one investigates the effect of low-temperaturre (up to 4.2 K) cooling on magnetic properties of electrotechnical steel samples. Dependence of hysteresis losses in proper cycles of reverse magnetization with values of magnetic induction in a sample, which reach saturation induction, is studied. Application of the system allows to carry out routine monitoring of magnetic characteristics of different steels and to choose the most fitting one for application as a superconducting-dipole yoke of the IHEP accelerating storage complex. The system includes the 100 W programmable bipolar current source, analogue integrator, programmable timer and reference voltage generator, two-channel programmable amplifier, two bipolar 12-th bit ADC with 4K memory buffer, SUMMA interface and microcomputer CM-4. 6 refs.; 3 figs.; submitted to the journal Prib. Tekh. Ehksp.

43102 (INP–1302/PS, pp. 281-285) **Production of secondary radioactive beams at GANIL from 44 MeV/u Ar projectiles.** Bimbot, R. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire); Della Negra, S.; Auger, P.; Bastin, G.; Anne, R.; Delagrange, H.; Hubert, F. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The GANIL ^{40}Ar beam at 44 MeV/u, with a 99 mg/cm^2 Be primary target was used to produce radioactive beams. The spatial distribution and performance of the radioactive beam was studied. 3 refs., 1 fig., 1 tab. (L.I.).

43103 (INS–743) **Acceleration performance of a 50-MHz split coaxial RFQ and the design of a 25.5-MHz prototype.** Tokuda, N.; Arai, S.; Fukushima, T.; Morimoto, T.; Tojyo, E. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Mar 1989. 4p. Order Number DE89906509/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

Acceleration tests on a 50-MHz split coaxial RFQ have been conducted at INS. The 2-m long RFQ has accelerated protons from 2 to 60 keV. The experimental results concerning beam emittance and transmission efficiency agree with predictions of a computer simulation. Following this success, we are fabricating a 25.5-MHz prototype of 2-m long. The issues of the study are to establish a structure standing a high-power operation and to accelerate heavy ions with a charge-to-mass ratio larger than 1/30. (author).

43104 (JINR–9-88-384) **Beam diagnostics station for slow extraction channel of JINR synchrophasotron.** Buldakovskij, V.N.; Grigor'ev, V.P.; Zinov'ev, L.P. and others. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy. 1988. 8p. (In Russian). Order Number DE89635434/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The beam monitoring station for a slow extraction channel of the JINR synchrophasotron designed and manufactured at JINR is presented. It consists of an universal cylindrical vacuum chamber where a section for diagnostics of extracted beam is located. For purposes of beam diagnostics the following detectors were used: scintillation counters, multiwire ionization chambers, TV screens cylindrical ionization chambers for measuring beam absolute intensity etc. The driver used for beam diagnostics detector motion in vacuum volume of the chamber is described. The ionization chamber design and their parameters applied as detectors for control and monitoring of slow extraction beam parameters of JINR synchrophasotron are presented parameters of JINR synchrophasotron are presented. 3 refs.; 6 figs.; 1 tab.

43105 (KEK–88-9, pp. 78-104) **Inelastic instruments at the ISIS facility.** Taylor, A.D. (Rutherford Appleton Lab., Chilton (UK)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

This summarises the status of the inelastic spectrometers at the ISIS facility and gives some highlights from their scientific programme. The inelastic spectrometers HET, TFXA and IRIS are now being used routinely by UK and International research groups and have produced notable scientific results. Work has progressed steadily on eVS. The PRISMA spectrometer, the product of a collaboration between CNR, Italy and RAL, was installed this summer. Earlier this year an agreement was reached in principle between the Rutherford Appleton Laboratory and the University of Wurzburg (West Germany) to build a second spectrometer (ROTAX) for the study of coherent inelastic excitations. A more sophisticated technical concept than that of PRISMA, based on a nonuniformly rotating analyser, it will allow a greater flexibility in the choice of dynamic scans. Substantial progress has also been made on the design of MARI, the sister spectrometer to HET, which is being built as part of the UK-Japan collaboration on pulsed neutron scattering. (author).

43106 (KEK–88-9, pp. 17-39) **ISIS status, September 1987.** Williams, W.G. (Rutherford Appleton Lab., Chilton (UK)). National

Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

Now, ISIS is the most powerful operational pulsed neutron source in the world. The layout of the facility and its nominal design performance are shown. The injector is a 70 MeV linear accelerator for H^- ions, the electrons of which are stripped at the injection into the proton synchrotron. Intense 0.4 μs pulses of protons are accelerated in the synchrotron up to nearly 800 MeV, thereafter, they are extracted through a beam channel to the target station. The target is the plates of depleted uranium clad with Zircaloy, and each proton produces 25 neutrons with MeV level energy. These neutrons are slowed down in two ambient water moderators placed above the target and two cryogenic moderators placed below the target, one is liquid methane at 95 K and another is supercritical hydrogen at 25 K. The target and moderator assembly is surrounded by a beryllium reflector cooled with D_2O. The whole target complex is surrounded by a biological shield, in which there are 18 neutron beam holes which currently serve 12 spectrometers. The recent performance of ISIS and a number of the troubles occurred are reported. 11 experimental facilities or instruments for condensed matter research are provided. Three neutron spectrometers, PRISMA, SANDALS and MARI are described. (K.I.).

43107 (KEK–88-9, pp. 40-77) **Diffraction instruments at the ISIS facility.** Johnson, M.W. (Rutherford Appleton Lab., Chilton (UK)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The report describes the instruments used for elastic scattering experiments at the ISIS facility, and gives a few examples of the type of science performed on each instrument over the last year. The instruments include HRPD, LAD, SXD, POLARIS, CRISP and LOQ. HRPD (high resolution powder diffractometer) is a vary high resolution neutron powder diffractometer situated at the end of a ~ 100 m guide. The $\Delta d/d$ resolution of $\sim 5 \times 10^{-4}$ permits not only traditional neutron powder diffraction experiments based around the Rietvelt profile refinement method but also new experiments such as abinitio structure determination and line broadening analysis. LAD (liquids and amorphous materials diffractometer) is used for such science areas as molten salts, molecular liquids and amorphous system. Work with SXD (single crystal diffractometer) on a well characterized single crystal sample of SrF_2 has produced some interesting and unique data on the anharmonic thermal vibrations of the fluorine atoms. POLARIS is the polarised neutron spectrometer in development at ISIS. Neutron polarisation analysis is the only method by which an unambiguous separation of magnetic, nuclear coherent and nuclear spin incoherent scattering can be achieved. The critical reflection spectrometer, CRISP, is designed to study problems in surface and interfacial chemistry, surface magnetism and low-dimensional structures. (N.K.).

43108 (KEK–88-9, pp. 190-196) **Polarized proton filter at KENS.** Masuda, Y. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

Polarized proton filter as a neutron polarize was constructed for the spallation neutron source. Protons in the filter material were polarized up to 80 % by the microwave pumping in a ^4He bath. Epithermal neutrons were polarized upon passing through the polarized proton filter. The neutron polarizations were more than 70 %. The neutron transmittance of the filter was about 0.25. This performance is statisfactory in caring out polarized neutron experiment with the spallation neutron source. In fact, parity-nonconserving effect in neutron radiative capture reaction was examined using this apparatus and a very large asymmetry was found in a p-wave resonance. (author).

43109 (KEK–88-9, pp. 162-176) **Computing and data acquisition at the ISIS facility.** Johnson, M.W. (Rutherford Appleton Lab., Chilton (UK)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The report gives an overview of the hardware and software employed at the ISIS facility for data acquisition, analysis and display. The report also explains the philosophy behind the systems chosen, and lastly, looks to the future to see what problems have to be faced in moving towards neutron instruments employing large numbers of detectors and increased neutron fluxes. The interconnected systems of Data Acquisition Electronics (DAE), CAMAC control, Front-End Minicomputers (FEMS), HUB computer and associated software which provides the ISIS instrumentation with its control, acquisition, display, analysis and archival functions is collectively known as the PUNCH system. The DAE consists of a System Crate and up to 16 Instrument Crates for each instrument. They are joined by the Instrument Bus (IB). The system crate is located close to the FEM computer and is connected to it by an extension of the VAX UNIBUS (or QBUS). The Instrument crates are located close to the instrument detectors and hence the Instrument Bus is typically 10-30 m long. At ISIS, it was realised that there was sufficient commonality in the primary analysis and display requirements to justify a common approach. The result has been the production of a language, called GENIE, for neutron data manipulation and display. (Nogami, K.).

43110 (KEK–88-9, pp. 177-183) **KENS data acquisition system KENSnet.** Arai, Masatoshi (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Furusaka, Michihiro; Satoh, Setsuo; Johnson, M.W. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The installation of a new data acquisition system KENSnet has been completed at the KENS neutron facility. For data collection, 160 Mbytes are necessary for temporary disk storage, and 1 MIPS of CPU is required. For the computing system, models were chosen from the VAX family of computers running their proprietary operating system VMS. The VMS operating system has a very user friendly interface, and is well suited to instrument control applications. New data acquisition electronics were developed. A gate module receives a signal of proton extraction time from the accelerator, and checks the veto signals from the sample environment equipment (vacuum, temperature, chopper phasing, etc.). Then the signal is issued to a delay-time module. A time-control module starts timing from the delayed start signal from the delay-time module, and distributes an encoded time-boundary address to memory modules at the preset times anabling the memory modules to accumulate data histograms. The data acquisition control program (ICP) and the general data analysis program (Genie) were both developed at ISIS, and have been installed in the new data acquisition system. They give the experimenter 'user-friendly' data acquisition and a good environment for data manipulation. The ICP controls the DAE and transfers the histogram data into the computers. (N.K.).

43111 (KEK–88-9, pp. 184-189) **Broad-band neutron polarisation at ISIS.** Williams, W.G. (Rutherford Appleton Lab., Chilton

(UK)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488--: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The paper describes some of the recent polarised beam developments at ISIS. The polarised beam version of the critical reflection spectometer CRISP was commissioned early in 1987. Incident beam polarisation is provided using a cobalt-titanium polarising supermirror which is effective over a θ/λ range up to 2.0 deg nm^{-1}, and contains a gadolinium-titanium anti-reflecting underlayer. A new method is devised for calibrating the beam polarisation $P(\lambda)$ and spin flipper efficiency $f(\lambda)$ on CRISP which is applicable to all types of slow polarised neutron instruments. The basic principle of the method is to use an analyser which is identical to the polariser, and to measure three quantities: flipping ratio with the spin flipper 'off' and 'on'; the shim ratio, i.e. intensity ratio 'with' and 'without' a depolarising mild steel shim with efficiency S placed between the polarisers, first with the spin flipper 'off'; and the shim ratio with the spin flipper 'on'. The principle of using the spin-dependent absorption by polarised nuclei in a filter to polarise thermal and cold neutron beams is now well established. Highly effective Gd:Ti antireflecting layers have been developed which absorb the unwanted spin neutrons at all (θ/λ). This means that the polarisation of the reflected neutrons can now be incorporated into polarising neutron guides and polarising Soller benders. (N.K.).

43112 (KEK–88-11) **Improvements on monitor system in the KEK 2.5-GeV linac.** Shidara, T.; Oogoe, T.; Ogawa, Y. and others. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Jan 1989. 25p. Order Number DE89906469/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Improvements to the monitor system of the KEK 2.5-GeV linac have been undertaken. Energy analyzing stations were added to both the positron generator linac and the 2.5-GeV electron linac in order to realize easier checking of beam energy. Wall current monitors and profile monitors were added in the beam transport line between the positron generator linac and the 2.5-GeV electron linac in order to realize easier positron-beam transfer. As a result of the installation of an automatic beam-current-surveillance system and with other existing surveillance systems, more reliable and easier operation of the linac is expected. (author).

43113 (KFK–4554) **Generation and focusing of an intense pulsed proton beam using a self-magnetically B_Θ-insulated ion diode.** Schimassek, W. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Physik. Mar 1989. 78p. (In German). Order Number DE89796017/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

A selfmagnetically B_Θ-insulated ion diode was investigated and optimized for generation and focusing of a pulsed high intensity proton beam for generation of high power-density in matter. The experiments were done at the pulsed power line KALIF (2 MV, 50 ns, 2 Ω). The protons got energies up to 1.8 MeV and the proton ratio in the ion beam was about 50%. The efficiency of the ion current depends on the magnetic field in the diode and have reached values up to 70%. The maximum total diode current was about 800 kA. The focusing properties were improved by optimizing the diode and gap geometries and decreasing the beam divergence. The focus diameter was reduced to about 10 mm giving a focused proton power density of about 0.35 TW/cm^2. Measurements of the current density of the protons at the anode were done for the first time and a good agreement with Particle-in-Cell-calculations was found. The electron-loss in the diode was reduced leading to a higher life-time of the diode of 10-15 pulses. (orig.).

43114 (LBL–25964) **AC magnetic measurements of the ALS Booster Dipole Engineering Model Magnet.** Green, M.I.; Keller, R.; Nelson, D.H.; Hoyer, E. Lawrence Berkeley Lab., CA (USA). Mar 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–248: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE89016345/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

10 Hz sine wave and 2 Hz sawtooth AC magnetic measurements of he curved ALS Booster Dipole Engineering Model Magnet have been accomplished. Long curved coils were utilized to measure the integral transfer function and uniformity. Point coils and a Hall Probe were used to measure magnetic induction and its uniformity. The data were logged and processed by a Tektronix 11401 digital oscilloscope. The dependence of the effective length on the field was determined from the ratio of the integral coil signals to the point coil signals. Quadrupole and sextupole harmonics were derived from the point and integral uniformity measurements. 5 refs., 4 figs., 2 tabs.

43115 (LBL–25965) **Design, fabrication, and calibration of curved integral coils for measuring transfer function, uniformity, and effective length of LBL ALS [Lawrence Berkeley Laboratory Advanced Light Source] Booster Dipole Magnets.** Green, M.I.; Nelson, D.; Marks, S.; Gee, B.; Wong, W.; Meneghetti, J. Lawrence Berkeley Lab., CA (USA). Mar 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–246: 13. particle accelerator conference, 20-23 Mar 1989). Order Number DE89016347/JAW. Available from NTIS, PC A02/MF A01 - OSTI.

A matched pair of curved integral coils has been designed, fabricated and calibrated at Lawrence Berkeley Laboratory for measuring Advanced Light Source (ALS) Booster Dipole Magnets. Distinctive fabrication and calibration techniques are described. The use of multifilar magnet wire in fabrication integral search coils is described. Procedures used and results of AC and DC measurements of transfer function, effective length and uniformity of the prototype booster dipole magnet are presented in companion papers. 8 refs.

43116 (LBL–25973) **Advanced Light Source (ALS) beam position monitor.** Hinkson, J.; Johnston, J.; Ko, I. Lawrence Berkeley Lab., CA (USA). Mar 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–249: 13. particle accelerator conference, 20-23 Mar 1989). Order Number DE89016312/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The ALS is a third-generation synchrotron light source currently under construction at LBL. The accelerator complex will consist of a 1–2 GeV electron storage ring, a 1.5 GeV booster synchrotron, a 50 MeV linac, and low and high energy beam transfer lines. Beam pickup devices and electronic instrumentation has been specified for the accelerator, and development of the beam position monitor (BPM) systems is well under way. Considerable effort has gone into the storage ring BPM system design in particular because of the need for very fast and accurate measurements. We meet the speed and accuracy requirements in the electronics with parallel processing and error correction techniques. A tuned receiver is provided for every beam position pickup, and for every array of four pickups there is a microprocessor controlling the measurement and recording data. In this paper we report on the requirements, design, and performance of the storage ring BPM system. 3 refs., 3 figs.

43117 (LBL–25992) **Insertion devices for the Advanced Light Source at LBL.** Hassenzahl, W.; Chin, J.; Halbach, K.; Hoyer, E.; Humphries, D.; Kincaid, B.; Savoy, R. Lawrence Berkeley Lab., CA (USA). Mar 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–247: 13. particle accelerator conference, 20-23 Mar 1989). Order Number DE89016348/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Advanced Light Source (ALS) at the Lawrence Berkeley Laboratory will be the first of the new generation of dedicated synchrotron light sources to be put into operation. Specially designed insertion devices will be required to realize the high brightness photon beams made possible by the low emittance of the electron beam. The complement of insertion devices on the ALS will include undulators with periods as short as 3.9 cm and one or more high field wigglers. The first device to be designed is a 5 m long, 5 cm period, hybrid undulator. The goal of very high brightness and high harmonic output imposes unusually tight tolerances on the magnetic field quality and thus on the mechanical structure. The design process, using a generic structure for all undulators, is described. 5 refs., 4 figs., 1 tab.

43118 (LBL–26012) **Magnet power supplies for the Advanced Light Source.** Jackson, L.T.; Lutz, I.C. Lawrence Berkeley Lab., CA (USA). Mar 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–245: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE89016346/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Lawrence Berkeley Laboratory (LBL) is building an Advanced Light Source (ALS) to produce synchrotron radiation. An electron linear accelerator, and a booster synchrotron are used to accelerate the electron beam to 1.5 GeV to fill the storage ring. This paper describes the power supplies used for the magnets in the booster and the storage ring and the interface requirements for computer control and monitoring the power supplies and magnet currents. 1 ref., 3 figs., 2 tabs.

43119 (UCRL–100316) **50 MHz 12 MW induction linac current modulator.** Bowles, E.E.; Turner, W.C. Lawrence Livermore National Lab., CA (USA). 17 May 1989. 6p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. (CONF-890665–43: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, CA (USA), 12-14 Jun 1989). Order Number DE89016641/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper describes a scheme to control the intrapulse energy variations of long pulse bursts of an induction linac. Analog control over the electron beam injector current is exercised in such a way that accelerator beam load variations compensate for thermal impedance variations of the accelerator cell ferrites. Circuit topology and test data are presented. The circuit uses 64 planar triodes to modulate the shunt impedance of two induction cells of the electron beam injector. Delayed feedback is used to apply a control signal to the modulator that varies the injector current to null the interpulse beam energy sweep at the linac output. The modulator exerts analog control over the top 5% of the beam current. It operates at a 60-ns pulse width and at up to a 0.1% duty factor. 8 figs.

43120 (UCRL–100416) **A conceptual design for an actively cooled, high-average-power electron-beam accelerator.** VanSant, J.; Stone, R.R.; Hedtke, R.; Kang, S.W.; Ng, D. Lawrence Livermore National Lab., CA (USA). 25 May 1989. 9p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. (CONF-890815–20: 24. intersociety energy conversion engineering conference, Washington, DC (USA), 7-12 Aug 1989). Order Number DE89016648/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A major goal of researchers in the Beam Research Program at the Lawrence Livermore National Laboratory is to use induction linear accelerators to produce high-average-power electron beams. As the peak power and the duty factor of the electron beam are increased, the method by which residual electron energy is absorbed becomes increasingly important. We have completed a conceptual design of an electron beam absorber system that uses water as both an energy absorber and a cooling medium. This configuration uses an aluminum window to separate the water absorber from a vacuum beamline. Such an arrangement has several desirable features. First, any necessary reconfiguration for an increase or decrease in run time and/or beam power is minimal. Also, the subsystems use current technology. We describe a point design for the window, the absorber tank, and its subsystems. 10 refs., 10 figs., 1 tab.

43121 Mirror and grating surface figure requirements for grazing incidence synchrotron radiation beamlines. Hulbert, S.L. (National Synchrotron Light Source, Brookhaven National Lab., Upton, NY (US)); Sharma, S. vp. of Grazing incidence optics for astronomical and laboratory applications. Bowyer, S.; Green, J.C. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-8708242–: Conference on XUV optics and applications - grazing incidence optics for astronomical and laboratory applications, 16-21 Aug 1987).

At present, grazing incidence mirrors are used almost exclusively as the first optical element in VUV and soft x-ray synchrotron radiation beam lines. The performance of these mirrors is determined by thermal and mechanical stress-induced figure errors as well as by figure errors remaining from the grinding and polishing process. With the advent of VUV and soft x-ray undulators and wigglers has come a new set of thermal stress problems related to both the magnitude and the spatial distribution of power from these devices. In many cases the power load on the entrance slits and gratings in these beamlines is no longer negligible. The dependence of thermally-induced front-end mirror figure errors on various storage ring and insertion device parameters (especially those at the NSLS) and the effects of these figure errors on two classes of soft x-ray beam lines are presented.

43122 Progress on a 2 MV injector for a scaled HIF accelerator experiment. Rutkowski, H.L. (Lawrence Berkeley Lab., CA (USA)); Faltens, A.; Humphries, S.; Vanecek, D.; Pike, C.; Johnson, R.M.; Meyer, E.A. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 206-212 (15 May 1989). DOE Contract AC03-76SF00098. (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

A sixteen-beam injector to supply 500 mA per beam of C^+ ions, which was initially designed and partially constructed at Los Alamos National Laboratory, is under further development at LBL. We report on development work involving single and multiple carbon arc sources. These sources are useful because they can easily supply the 25 mA/cm^2 needed for the device. They are pulsed sources which do not cause unacceptable background gas loads in the column. We present emittance and reproducibility data. Acceleration is by a high gradient column using a succession of aperture lenses to focus the beam. The electrodes are arranged with holes for parallel beam inside 28 inch alumina insulators. Data on beam propagation and electron trapping in the column are presented. The acceleration potential is provided by a Marx bank with inductive grading along the structure. The resulting 34 μs rise time pulse allows the accelerating potential to equilibrate along the column before the current is injected. Acceleration occurs during as 1 μs window at a peak of pulse, in which the voltage is flat within 0.1%. (orig.).

43123 Simulations of high-brightness rf photocathode guns for LLNL-SLAC-LBL 1 GeV test experiment. Chen Yujiuan (Lawrence Livermore National Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(3): 433-442 (15 Jul 1989). DOE Contract W-7405-ENG-48.

An ideal rf photocathode gun in a π-mode configuration supporting only a single mode with no nonlinear rf field is studied numerically by using the simulation code PARMELA. For a given electron bunch, the normalized emittance can be minimized. Both the minimum normalized emittance and the optimized accelerating field are proportional to the square root of the peak current. Three possible rf photocathode guns for LLNL-SLAC-LBL 1 GeV test are simulated. It is found that both a 2 ps half-width bunch and a 6 ps half-width bunch with the transverse emittance roughly 8-17 mm mrad and 1 nC charge per bunch can be generated by guns with (1) f = 1269 MHz, E_0 = 30 MV/m; (2) f = 1269 MHz, E_0 = 60 MV/m; and (3) f = 2856 MHz, E_0 = 60 MV/m. Here, f is the rf frequency, and E_0 is the peak accelerating field. (orig.).

43124 A dynamic method for continuously measuring magnetic field profiles in planar micropole undulators with submillimeter gaps. Tatchyn, R. (Stanford Univ., CA (USA). Stanford Synchrotron Radiation Lab.). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(3): 655-664 (15 Jul 1989). DOE Contract AC03-82ER13000;FG06-85ER13309.

Conventional techniques for measuring magnetic field profiles in ordinary undulators rely predominantly on Hall probes for making point-by-point static measurements. As undulators with submillimeter periods and gaps become available, such techniques will start becoming untenable, due to the relative largeness of conventional Hall probe heads and the rapidly increasing number of periods in devices of fixed length. In this paper a method is presented which can rapidly map out field profiles in undulators with periods and gaps extending down to the 100 μm range and beyond. The method, which samples the magnetic field continuously, has been used successfully in profiling a recently constructed 726 μm period

undulator, and seems to offer some potential advantages over conventional Hall probe techniques in measuring large-scale undulator fields as well. (orig.).

43125 Principles and technology of RFQs. Schempp, A. (Institut fur Angewandte Physik, Universitat Frankfurt D6000 Frankfurt/M, W. Germany (DE)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1477-1499 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

The RFQ is a linear accelerator structure for low velocity ions which focuses and accelerates with the help of electrical radio-frequency (rf) quadrupole fields. It was first proposed by Kapchinskij and has since been applied in numerous labs mainly as an injector for Alvarez accelerators. The RFQ can simultaneously focus, bunch, and accelerate a high current beam from the ion source, which can be on a relatively low d.c. potential. This allows the use of special ion sources which can be bulky and can have high power consumption like sources for polarized or highly charged ions.

43126 Intense, low emittance injectors for RF electron linacs. Smith, T. I. (High Energy Physics Laboratory, Stanford University, Stanford, California 94305 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1543-1552 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

A workshop on low emittance beams was held at Brookhaven National Laboratory from March 20 to March 25, 1987. The workshop was held under the auspices of the International Committee on Future Accelerators (ICFA), and was intended to explore issues relating to the production of electron beams with an unprecedented combination of high charge density and low emittance. The following material is largely a result of discussions held during the workshop, and represents an attempt to estimate the severity of some of the problems which would be encountered in the design of an RF linac injector consistent with the workshop goals.(AIP)

43127 Photocathode RF guns. Sheffield, R. L. (MS H825, Los Alamos National Laboratory, Los Alamos, NM 87545 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1500-1531 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

Free-electron oscillators and amplifiers require electron accelerators capable of delivering pulse trains of electron bunches of high charge density in a wiggler or undulator. A high electron density implies a high peak current (100 A to 2000 A) and a low transverse beam emittance (<80 π·mm·mrad, determined by matching the transverse size of the electron beam to the optical beam in the wiggler). Electron beam collider machines also require high peak currents (>8nC in picoseconds) with extremely small emittances (<10 π·mm·mrad).

43128 Low emittance thermionic electron guns. Herrmannsfeldt, W. B. (Stanford Linear Accelerator Center, Stanford, California 94309 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1532-1542 (5 Apr 1989). DOE Contract AC03-76SF00515. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

A description of low emittance thermionic electron guns used for injection of electron beam into free electron lasers (FEL) and linear accelerators is given. A physical description of electron beam emitted from thermionic cathodes is sketched. Examples of electron guns used in FEL's and electron linacs are presented. (AIP)

43129 Final focus systems for linear colliders. Erickson, R. A. (Stanford Linear Accelerator Center, Stanford, California 94305 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1553-1591 (5 Apr 1989). DOE Contract AC03-76SF00515. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

In this paper, the functions of final focus systems in general will be described, along with a discussion of performance limitations arising from some of these practical design considerations. To illustrate the main ideas, the final focus system of the Stanford Linear Collider will be presented, and the basis for the key parameter choices will be discussed. (AIP)

43130 Positrons for linear colliders. Ecklund, S. (Stanford Linear Accelerator Center, Stanford, California 94305 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1592-1614 (5 Apr 1989). DOE Contract AC03-76SF00515. (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

The pair production process of obtaining positrons has the advantage of being essentially instantaneous, allowing production of beams with a time structure or bunching required for the linear collider. Photons which are used for the pair production are produced via electromagnetic cascades from electron interactions in matter. We describe Monte Carlo simulations of this method of positron production. (AIP)

43131 Perspectives on micropole undulators in synchrotron radiation technology. Tatchyn, R. (Stanford Synchrotron Radiation Laboratory, Stanford University, Stanford, California 94305, and Institute of Theoretical Science, University of Oregon, Eugene, Oregon 97403 (US)); Csonka, P.; Toor, A. *Review of Scientific Instruments (USA),* 60(7): 1796-1804 (Jul 1989). DOE Contract AC03-82ER13000.

Micropole undulators promise to advance synchrotron radiation (SR) technology in two distinct ways. The first is in the development of economical, low-energy storage rings, or linacs, as soft x-ray sources, and the second is in the opening up of gamma-ray spectral ranges on high-energy storage rings. In this paper the promise and current status of micropole undulator (MPU) technology are discussed, and a review of some practical obstacles to the implementation of MPU's on present-day storage rings is given. Some successful results of recent performance measurements of micropole undulators on the Lawrence Livermore National Laboratory linac are briefly summarized.

43132 Magnetic measurements on insertion devices at NSLS. Decker, G. (National Synchrotron Light Source, Brookhaven National Observatory, Upton, New York 11973 (US)); Galayda, J.; Solomon, L.; Kitamura, M. *Review of Scientific Instruments (USA),* 60(7): 1845-1848 (Jul 1989).

Magnetic measurements on three insertion devices for use in the National Synchrotron Light Source (NSLS) x-ray ring are described. Hall probes were used for field mapping, and rotating long coils were used to determine integrated multipole coefficients. Results are presented for an iron pole-REC hybrid indulator, a vanadium permendur pole-REC hybrid wiggler, and a 5 T superconducting wiggler.

43133 Antiproton source. Peoples, J. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 1845-1877 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

Design of the antiproton source for the Fermilab Tevatron is presented Antiprotons are produced when 120 GeV protons are extracted from the main ring and directed onto a tungsten target in the $\bar{p}$ target station. The beam optics required to obtain a luminosity of 10^{30} cm^{-2} sec^{-1} with 6×10^{10} antiprotons per bunch or 2×10^{11} $\bar{p}$'s every 12 hours are described. (AIP)

43134 Multilayer mirrors as power filters in insertion device beamlines. Kortright, J. B. (Center for X-ray Optics, Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720 (US)); DiGennaro, R. S. *Review of Scientific Instruments (USA),* 60(7): 1995-1998 (Jul 1989). DOE Contract AC03-76SF00098.

The power-filtering capabilities of multilayer bandpass x-ray mirrors relative to total reflection low-pass mirrors are presented. Results are based on calculations assuming proposed wiggler sources on the upcoming generation of low-energy (1.5 GeV) and high-energy (7.0 GeV) synchrotron radiation sources. Results show that multilayers outperform total reflection mirrors in terms of reduction in reflected power by roughly an order of magnitude, with

relatively small increases in total absorbed power and power density over total reflection mirrors, and with comparable reflected flux values. Various aspects of this potential application of multilayer x-ray optics are discussed.

43135 Variable focus crystal diffraction lens. Smither, R. K. (Argonne National Laboratory, Argonne, Illinois 60439 (US)). *Review of Scientific Instruments (USA),* 60(7): 2044-2047 (Jul 1989). DOE Contract W-31-109-ENG-38.

A new method has been developed to control the shape of the surface of a diffracting crystal that will allow it to function as a variable focus crystal diffraction lens for focusing photon beams from a synchrotron source. The new method uses thermal gradients in the crystal to control the shape of the surface of the crystal in two dimensions and allows one to generate both spherical and ellipsoidal surface shapes. In this work the thermal gradient was generated by core drilling two sets of cooling channels in a silicon crystal so that cooling or heating fluids could be circulated through the crystal at two different levels. The first set of channels is close to the surface of the crystal where the photon beam strikes it. The second set of channels is equidistant from the back surface. If a concave surface is desired, the fluid in the channels just below the surface exposed to the beam is cooler than the fluid circulating through the channels near the back surface. If a convex surface is desired, then the cooling fluid in the upper channels near the surface exposed to the incident photon beam is warmer than the fluid in the lower channels. The focal length of the crystal lens is varied by varying the thermal gradient in the crystal. This approach can also be applied to the first crystal in a high power synchrotron beamline to eliminate the bowing and other thermal distortions of the crystal caused by the high heat load.

43136 Resonant extraction at the tevatron. Harrison, M. (Fermi National Accelerator Laboratory, P.O. Box 500, Batavia, IL 60510 (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2009-2032 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

At the most basic level, extraction is the process of persuading a circulating beam to leave the machine in a controlled fashion. For a variety of reasons the method we choose to implement at the Tevatron was that of horizontal half-integer resonant extraction.

43137 Design of the laser-driven RF electron gun for the BNL accelerator test facility. McDonald, K.T. (5310200). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Electron Devices (USA),* 35(11): 2052-2059 (Nov 1988).

The BNL electron gun incorporate a laser-driven photocathode in the wall of a 1 1/2 cell RF cavity operated at a peak field of 100 MV/m. Pulses of 4.5-MeV energy, 5-ps width, and 1-nC charge are produced with very little emittance growth due to the effects of space-charge and nonlinear RF fields. The design of the gun was aided by extensive computer simulation described here.

43138 Comparison of elliptical and spherical mirrors for the grasshopper monochromators at SSRL. Waldhauer, A. P. (Stanford Synchrotron Radiation Laboratory, P.O. Box 4349, Bin 99, Stanford, California 94309 (US)). *Review of Scientific Instruments (USA),* 60(7): 2109-2112 (Jul 1989). DOE Contract AC03-82ER13000.

A comparison of the performance of a spherical and elliptical mirror in the grasshopper monochromator is presented. The problem was studied by ray tracing and then tested using visible (λ=633 nm) laser light. Calculations using ideal optics yield an improvement in flux by a factor of up to 2.7, while tests with visible light show an increase by a factor of 5 because the old spherical mirror is compared to a new, perfect elliptical one. The FWHM of the measured focus is 90 μm with a spherical mirror, and 25 μm with an elliptical one. Elliptical mirrors have been acquired and are now being installed in the two grasshoppers at SSRL.

4304 Storage Rings

43139 (LA-UR–89-2340) **Status of PSR [Proton Storage Ring].** Macek, R.J. Los Alamos National Lab., NM (USA). 1989. 29p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-890299–16: AHF accelerator design workshop, 20-25 Feb 1989). Order Number DE89015266/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

The Los Alamos Proton Storage Ring (PSR) now operates with 35μA at 20-Hz pulse repetition rate. Beam availability during 1988 suffered because of a number of problems with hardware reliability and from narrow operating margins for beam spill in the extraction line. A strong effort is underway to improve reliability with an eventual goal of obtaining beam availability in excess of 75%. Beam losses and the resulting component activation have limited operating currents to their present values. In detailed studies of the problem, loss rates were found to be approximately proportional to the circulating current and can be understood by a detailed accounting of emittance growth in the two-step injection process along with Coulomb scattering of the stored beam during multiple traversals of the injection foil. It is now apparent that the key to reducing losses is in reducing the number of foil traversals. A program of upgrades to reduce losses and improve the operating current is being planned. 8 refs., 16 figs.

43140 (LBL–25976) **Computer-aided studies of the ALS 500 MHz storage ring cavity.** Lo, C.C.; Taylor, B. Lawrence Berkeley Lab., CA (USA). Mar 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–243: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE89016343/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The design of the ALS storage ring 500 MHz cavity has been modeled with Mafia and Urmel codes. The effects of the holes cut for the drive port, the higher order mode damping port, the probe port and tuner plunger were modeled with the Mafia codes. The frequency dependence on the shape and spacing of the nose cones and the general shape of the cavity were modeled with Urmel codes. 9 refs., 7 figs., 1 tab.

43141 (LBL–25978) **Advanced light source storage ring rf system.** Taylor, B.; Baptiste, K.; Lancaster, H.; Lo, C.C. Lawrence Berkeley Lab., CA (USA). Mar 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890335–242: 13. particle accelerator conference, Chicago, IL (USA), 20-23 Mar 1989). Order Number DE89016349/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The short electron bunch length (30ps design target) of the Advanced Light Source (ALS) stored beam is capable exciting a wide spectrum of higher order mode (HOM) frequencies. Further, the small aperture and low cut off frequency of the beam enveloping components does not allow for transmission and consequent attenuation of the lower frequency HOM components. The small cross section and divergence of the high brightness electron beam will allow for more sophisticated high resolution experiments by synchrotron radiation users. A more stringent requirement on beam position stability results, however. In this area transmitted mechanical vibration becomes a problem. The ALS RF system splits 300kW of CW 500MHz power between two single cell cavities. Compared to past practice this power rating is high. The use of only two cavities however has some advantages, it simplifies the waveguide feed system and releases room in straight sections for insertion devices, more important it reduces HOM and beam impedance problems. 3 refs., 2 figs.

43142 Development of highly polished, grazing incidence mirrors for synchrotron radiation beam lines at SSRL. Tirsell, K.G. (Lawrence Livermore National Lab., P.O. Box 808, Livermore, CA (US)); Berglin, E.J.; Fuchs, B.A.; Holdener, F.R.; Humpal, H.H.; Karpenko, V.P.; Kulkarni, S.; Fantone, S.D. vp. of Grazing incidence optics for astronomical and laboratory applications. Bowyer, S.; Green, J.C. SPIE Society of Photo-Optical Instrumentation Engineers, Bellingham, WA (1988). (CONF-8708242–: Conference on XUV optics and applications - grazing incidence optics for astronomical and laboratory applications, 16-21 Aug 1987).

New platinum-coated grazing incidence mirrors with low surface roughness have been developed to focus bending magnet radiation from the SSRL/SLAC SPEAR storage ring on the entrance slits of

two Beam Line VIII grating monochromators. The first mirror in the toroidal grating monochromator (TGM) branch is a cooled SiC cylinder capable of absorbing synchrotron radiation power levels of up to 260 watts without excessive distortion. This mirror deflects the beam vertically through a 12^0 angle and focuses it sagitally on the TGM entrance slit plane. The second TGM optical element is a fused-silica spherical mirror with a large radius of curvature that deflects the beam vertically through an additional 12^0 and focuses it tangentially with 3/1 demagnification. The first mirror in our spherical grating branch is a 5^0-vertically deflecting, cooled SiC toroid designed to focus tangentially on the monochromator entrance slits and sagitally on the exit slits. A 4^0-deflecting fused silica mirror is used after the exit slits in each beam line to refocus on to the sample. For this application a thin cylinder is bent to approximate an ellipsoid. The mirrors are now installed at SSRL and performance measurements are planned. Qualitatively the focus of the TGM optics at the entrance slit plane appears very good. In this paper the authors discuss considerations leading to the choice of SiC for each of the two first mirrors. They present highlights of the development of these mirrors with some emphasis on SiC polishing techniques. In addition, the specialized metrology developed to produce the more difficult figure of the toroid is described. Measured surface roughness and figure results are presented.

43143 Precision determination of the magnetic field in a muon storage ring using the cyclotron frequency of heavy ions - a technique for use in a new measurement of the muon g-2 value. May, M. (Brookhaven National Lab., Upton, NY (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(3): 410-412 (15 Jul 1989). DOE Contract AC02-76CH00016.

A new experiment will measure the muon g-2 value with 20 times better precision than it is presently known. To reach this goal, the magnetic field in the muon storage ring must be known to one part in 10^7. This can be achieved by storing singly charged heavy ions in the ring and measuring their cyclotron frequency. (orig.).

43144 Advanced light source at Lawrence Berkeley Laboratory. Cornacchia, M. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720 (US)). *Review of Scientific Instruments (USA),* 60(7): 1388-1392 (Jul 1989).

The 1–2-GeV synchrotron radiation source will be a national user-based facility providing photon beams of unprecedented brightness in the ultraviolet and soft x-ray region of the electromagnetic spectrum. The facility design is optimized to emphasize the use of undulators to provide high-spectral brilliance in the few electron volt to 1-keV spectral range; wigglers provide high flux up to approximately 10 keV. Beam structure of a few tens of picoseconds will be available for time-resolved experiments. The facility is designed for operational flexibility and to assure rapid commissioning. The initial complement of experimental stations consists of five insertion devices (four undulators and our wiggler) and associated beamlines, and two white light beams from bend magnets. Six other straight sections are available for additional insertion devices, and the design provides for up to 48 ports for beams from bending magnets. The storage ring is optimized for operation at 1.5 GeV with a maximum energy of 1.9 GeV. The injection system includes a 1-Hz, 1.5-GeV booster synchrotron for full energy injection at the nominal operating energy of the storage ring. Filling time for the maximum stored current of 400 mA is expected to be 2 min, and the beam half-life will be about 6 h. Attention is being given to the severe requirements for beam stability and the need to independently control photon beam alignment. We describe the important characteristics of the facility, significant aspects of the technical design of accelerator systems, insertion devices and photon beamlines, and considerations related to addressing projected user needs in the development of the project.

43145 PEP as a synchrotron radiation source. Bienenstock, A. (Stanford Synchrotron Radiation Laboratory, SLAC Bin No. 69, P.O. Box 4349, Stanford, California 94309-0210 (US)); Brown, G.; Wiedemann, H.; Winick, H. *Review of Scientific Instruments (USA),* 60(7): 1393-1398 (Jul 1989).

The 16-GeV storage ring PEP has characteristics which enable it to operate in modes with very low emittance and to accommodate very long undulators, producing synchrotron radiation at x-ray wavelengths with extremely high brightness and coherent power. Two beamlines, each illuminated by a 2-m long, 77-mm period undulator magnet, are now operational and others are planned. In parasitic operation during colliding-beam runs at 14.5 GeV, these beamlines provide photons above 10 keV with a peak brightness of about 10^{16} photons/(s mm^2 $mrad^2$) within a 0.1% bandwidth. In low-emittance tests at 7.1 GeV, horizontal emittances of about 5 nm rad were measured, which is about the same as that planned for the new third-generation x-ray sources. With a current of 15 mA at 7.1 GeV, the present undulators deliver photon beams from 2.7 to 14 keV with a peak brightness of about 10^{17} . Higher performance levels are expected with the implementation of longer undulators and shorter period undulators. In the longer term, because of its large circumference and long straight sections, PEP could be further developed to achieve even higher performance levels with an emittance below 1 nm rad, very long undulators and picosecond bunches, resulting in one to two orders of magnitude higher brightness and coherent power.

43146 Observation of x-ray undulator radiation on PEP. Lavender, W. (Stanford Synchrotron Radiation Laboratory, Stanford, California 94305 (US)); Brown, G.; Troxel, T.; Coisson, R. *Review of Scientific Instruments (USA),* 60(7): 1414-1418 (Jul 1989).

A 2-m undulator magnet and associated beamline have been installed on the electron-positron storage ring PEP. The undulator is designed to produce photons at 12 keV with high intensity when the storage ring is operated at its nominal energy of 14.5 GeV. We report measurements of the spectral and angular properties of the radiation when PEP is operated in a low-emittance ($\epsilon \sim 6 \times 10^{-9}$ m rad) configuration. The spectral properties are in good agreement with theoretical predictions.

43147 Performance of a hard x-ray undulator at CHESS. Bilderback, D. H. (CHESS, Cornell University, Ithaca, New York 14853 (US)); Batterman, B. W.; Bedzyk, M. J.; Finkelstein, K.; Henderson, C.; Merlini, A.; Schildkamp, W.; Shen, Q.; White, J.; Blum, E. B.; and others. *Review of Scientific Instruments (USA),* 60(7): 1419-1425 (Jul 1989). DOE Contract W-31-109-ENG-38.

A 3.3-cm period Nd-Fe-B hybrid undulator has been designed and successfully operated in the Cornell Electron Storage Ring (CESR). This 2-m-long, 123-pole insertion device is a prototype of one of the undulators planned for the Advanced Photon Source. In dedicated operation, the undulator produced the expected brightness at 5.437 GeV with the fundamental x-ray energy ranging from 4.3 to 7.9 keV corresponding to a change in gap from 1.5 to 2.8 cm.

43148 Perspectives on the use of very long undulators in high-energy storage rings. Coisson, R. (Dipartimento di Fisica, Universita' di Parma, 43100 Parma, Italy (IT)). *Review of Scientific Instruments (USA),* 60(7): 1426-1428 (Jul 1989).

A few electron storage rings exist (and possibly could be available in the future), with energy >10 GeV and with straight sections of the order of 100 m on which very long undulators could be installed. The exceptionally low emittance that these machines can reach when run at relatively low energies would allow highly degenerate radiation to be produced in the soft and medium x-ray range, with applications to biological imaging near the C and N *K* edges, holography, and nonlinear optics down to a few angstroms, pumping of soft x-ray ion lasers, picosecond or femtosecond resolution spectroscopy, etc.

43149 Beamline 10: A multipole wiggler beamline at SSRL. Karpenko, V. (Lawrence Livermore National Laboratory, Livermore, California (US)); Kinney, J. H.; Kulkarni, S.; Neufeld, K.; Poppe, C.; Tirsell, K. G.; Wong, J.; Cerino, J.; Troxel, T.; Yang, J.; and others. *Review of Scientific Instruments (USA),* 60(7): 1451-1456 (Jul 1989).

A beamline has been constructed at Stanford Synchrotron Radiation Laboratory (SSRL) whose radiation source is a multipole permanent magnet wiggler installed in a straight section of the SPEAR 3–3.5 GeV electron storage ring. The wiggler is a hybrid design that utilizes Nd–Fe alloy magnet material combined with Vanadium Permendur poles. It is approximately 2 m long and has 15 full wiggler periods. Its field is regulated by varying its gap height. It has a peak operating field, limited by the electron beam

vacuum chamber vertical aperture, of 1.4 T. The beamline consists of vacuum, safety, and optical components capable of transporting photons to one hard x-ray (3–30 keV) end station, with provisions for implementing up to two additional branch lines. The existing hard x-ray branch can be focused by a Pt-coated toroidal mirror with a cutoff energy of approximately 22 keV. The experimental end station is serviced by a Hower–Brown type double crystal monochromator. The wiggler and beamline construction was completed in the fall of 1987 and was operated for a brief period for characterization and experimental use. We present design details and results of the initial characterization studies.

43150 Liquid gallium cooling of silicon crystals in high intensity photon beams. Smither, R. K. (Argonne National Laboratory, Argonne, Illinois 60439 (US)); Forster, G. A.; Bilderback, D. H.; Bedzyk, M.; Finkelstein, K.; Henderson, C.; White, J.; Berman, L. E.; Stefan, P.; Oversluizen, T.; and others. *Review of Scientific Instruments (USA),* 60(7): 1486-1492 (Jul 1989). DOE Contract W-31-109-ENG-38.

The high-brilliance, insertion-device-based photon beams of the next generation of synchrotron sources (Argonne's APS and Grenoble's ESRF) will deliver large thermal loads (1–10 kW) to the first optical elements. Considering the problems that present synchrotron users are experiencing with beams from recently installed insertion devices, new and improved methods of cooling these first optical elements, particularly when they are diffraction crystals, are clearly needed. A series of finite element calculations were performed to test the efficiency of new cooling geometries and various cooling fluids. The best results were obtained with liquid Ga metal flowing in channels just below the surface of the crystal. Ga was selected because of its good thermal conductivity and thermal capacity, low melting point, high boiling point, low kinetic viscosity, and very low vapor pressure. Its very low vapor pressure, even at elevated temperatures, makes it especially attractive in UHV conditions. A series of experiments were conducted at CHESS in February of 1988 that compared liquid gallium-cooled silicon diffraction crystals with water-cooled crystals. A six-pole wiggler beam was used to perform these tests on three different Si crystals, two with new cooling geometries and the one presently in use. A special high-pressure electromagnetic induction pump, recently developed at Argonne, was used to circulate the liquid gallium through the silicon crystals. In all experiments, the specially cooled crystal was used as the first crystal in a two crystal monochromator. An infrared camera was used to monitor the thermal profiles and correlated them with rocking curve measurements. A second set of cooling experiments were conducted in June of 1988 that used the intense, highly collimated beam from the newly installed ANL/CHESS undulator.

43151 Performance of a directly water-cooled silicon crystal for use in high-power synchrotron radiation applications. Oversluizen, T. (National Synchrotron Light Source, Brookhaven National Laboratory, Upton, New York 11973 (US)); Matsushita, T.; Ishikawa, T.; Stefan, P. M.; Sharma, S.; Mikuni, A. *Review of Scientific Instruments (USA),* 60(7): 1493-1500 (Jul 1989). DOE Contract AC02-76CH00016.

Results of measurements made using the multipole wiggler at beamline 16 of Photon Factory are reported. Double crystal rocking curves, Si(111) and Si(333) topographs, and thermal maps of the cooled-crystal surface were measured at total incident power levels up to 1600 W and power densities up to 0.7 W/mm^2 , for two different crystal designs. Significant crystal deformation occurred in the form of surface curvature for both designs. Finite element calculations provided a preview of the experimental results and proved very valuable in interpretation of the measurements.

43152 Micropole undulators: Novel insertion devices for synchrotron sources. Toor, A. (Lawrence Livermore National Laboratory, Livermore, California 94550 (US)); Csonka, P.; Tatchyn, R. *Review of Scientific Instruments (USA),* 60(7): 1439-1440 (Jul 1989). DOE Contract AC03-82ER13000.

Micropole undulators (wigglers) are undulators (wigglers) with submillimeter periods and are referred to, generically, as micropole insertion devices. Compared to ordinary insertion devices, whose period λ_u is typically $\geq$1 cm, micropole devices have periods smaller by a factor $f \leq 10$. Therefore, the first-harmonic radiation emitted by a micropole undulator will have its photon energy E_γ increased by f and its spectral purity $\Delta\lambda/\lambda$ by f, provided the total length of the undulator l_u stays unchanged, and magnetic field errors, as well as the electron-beam emittance, are sufficiently small. Furthermore, to generate photons of the same E_γ as from the conventional device, the electron-beam energy E_e can be reduced by $f^{1/2}$, resulting in significantly lower construction and operating costs. Radiative energy losses can be correspondingly diminished for the associated storage rings. In this paper we report on results recently obtained by us in the practical implementation and design of micropole undulators at the Stanford Synchrotron Radiation Laboratory (SSRL) and the Lawrence Livermore National Laboratory (LLNL). Based on our work, micropole undulators with $f \leq 10^4$ appear feasible at the present time.

43153 Instrumentation for millisecond-resolution scattering studies. Stephenson, G. B. (IBM Research Division, Thomas J. Watson Research Center, P. O. Box 218, Yorktown Heights, New York 10598 (US)); Ludwig, K. F., Jr.; Jordan-Sweet, J. L.; Brauer, S.; Mainville, J.; Yang, Y. S.; Sutton, M. *Review of Scientific Instruments (USA),* 60(7): 1537-1540 (Jul 1989).

Time-resolved x-ray scattering studies of phase transition kinetics have been carried out using the wide-bandpass monochromator and fast linear position-sensitive detector system at the IBM/MIT beamline X-20C at the National Synchrotron Light Source (NSLS). We report here on the instrumentation that has been developed for these studies, and in particular on the methods used to measure, change, and control sample temperature with millisecond resolution.

43154 Arc chamber deformation in small storage rings under pressure loads. Sharma, S. (National Synchrotron Light Source, Brookhaven National Laboratory, Upton, New York, 11973 (US)). *Review of Scientific Instruments (USA),* 60(7): 1775-1778 (Jul 1989). DOE Contract AC02-76CH00016.

Bending deformations of small storage ring vacuum chambers under atmospheric pressure are described. Results from a finite element model are presented which show that bending deformations due to pressure forces on metal bellows and arc chambers can cause severe misalignments at the exit ports. The deformations are shown to be larger in arc chambers of small radii. The effect of using bellows load compensators and flexible supports to reduce the deformations in an existing storage ring by an order of magnitude is evaluated by analysis and compared to actual measurements.

43155 Spectral properties of segmented undulators for the 7-GeV Advanced Photon Source. Shenoy, G. K. (Advanced Photon Source, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Viccaro, P. J.; Alp, E. E. *Review of Scientific Instruments (USA),* 60(7): 1820-1823 (Jul 1989). DOE Contract W-31-109-ENG-38.

The effect of nonzero particle beam emittance and magnetic field errors on the on-axis spectral brightness (BT_0) of long undulators is discussed. It is shown that the quadratic dependence of BT_0 on the number of undulator periods, N, is reduced by emittance to N^x with $1 \leq x < 2$. Further reductions in the intensity result from random magnetic field errors present in the undulator. An approximate model for the intensity of the central core of radiation of the principle harmonics is discussed and the results compared to those from Monte Carlo-type calculations where emittance is explicitly accounted for. An estimation of the effects of random field errors on the on-axis brightness in the presence of nonzero particle emittance is made. For the particular case of undulators proposed for the 7-GeV Advanced Photon Source, the results indicate that 5-m-long devices segmented into two sections will provide the required spectral intensity of a single long undulator when both emittance and magnet errors are considered.

43156 Soft x-ray undulator for the U5 beamline at NSLS. Viccaro, P. J. (Advanced Photon Source, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Shenoy, G. K.; Kim, S. H.; Bader, S. D. *Review of Scientific Instruments (USA),* 60(7): 1813-1815 (Jul 1989). DOE Contract W-31-109-ENG-38.

The magnetic structure and spectral properties of a 7.5-cm, 30-period hybrid undulator are described. The device will be installed at the U5 port of the VUV storge ring at Brookhaven National Laboratory and will be a tunable source of very high brillance soft x-ray radiation over the range of 13 to approximately 150 eV.

43157 SUNY X3 beamline at NSLS. Phillips, J. C. (Chemistry Department, SUNY Buffalo and SUNY X3 Beamline, NSLS, 725A, Brookhaven National Laboratory, Upton, New York 11973 (US)). *Review of Scientific Instruments (USA),* 60(7): 1936-1938 (Jul 1989). DOE Contract FG02-86ER45231.

The State University of New York (SUNY) beamline at National Synchrotron Light Source [NSLS] has been moved to the X3 port during the NSLS Phase II shutdown. Additional floorspace and new equipment have enabled several changes and additions to the line to be made. There will be four sets of optics with independent operation. These will feed a short wavelength crystallography station, an x-ray spectroscopy station, a time-sharing crystallography/SAXS station, and a surface science chamber. The new design of the line is presented.

43158 Compact high flux photon beam position monitor. Johnson, E. D. (National Synchrotron Light Source, Brookhaven National Laboratory, Upton, New York 11973 (US)); Oversluizen, T. *Review of Scientific Instruments (USA),* 60(7): 1947-1950 (Jul 1989). DOE Contract AC02-76CH00016.

We have developed a new compact water-cooled beam position monitor for use at the NSLS X-13 Insertion Device Development beamline, currently fitted with a high-power, high-brightness soft-x-ray undulator. We describe the novel geometry of the monitor and present the results of tests which explore its sensitivity, stability, and linearity. These results were obtained on the NSLS Beamline Research and Development white light beamline, U14B, on the VUV ring and suggest that beam position monitors of this type might be adapted to other facilities with similar spectral characteristics.

43159 Undulator heat loading studies on x-ray monochromators cooled with liquid gallium. Bilderback, D. H. (Cornell High Energy Synchrotron Source, Cornell University, Ithaca, New York 14853 (US)); Henderson, C.; White, J.; Smither, R. K.; Forster, G. A. *Review of Scientific Instruments (USA),* 60(7): 1973-1976 (Jul 1989).

Heat loading tests were conducted with up to 360 W of undulator radiation incident on liquid-gallium-cooled silicon monochromators. Rocking curve measurements and temperature profiles (infrared camera) were obtained as a function of beam current. With large heat loads, the width of the rocking curves were observed to broaden and the gain in output flux per mA of beam current was significantly less at high beam currents than during low-current operation. The best performance was obtained using a slotted crystal with cooling channels located 0.76 mm below the surface. This crystal showed strong heating effects only above 40 mA and continued to produce an increase in output flux with beam current at the highest current tested of 76 mA.

43160 Self-filtering crystal monochromators for synchrotron x radiation. Cowan, P. L. (National Institute of Standards and Technology, Quantum Metrology Division, Gaithersburg, Maryland 20899 (US)); Brennan, S. *Review of Scientific Instruments (USA),* 60(7): 1987-1990 (Jul 1989).

Monochromator crystal heating and radiation damage may be reduced significantly by reflecting much of the incident radiated power from the surface of the crystal. This requires strong Bragg diffraction of the monochromatized beam at grazing incidence angles. Examples of such cases are described, such as extremely asymmetric diffraction and grazing angle diffraction, which would permit continuously tunable x-ray energy. Additional benefits such as increased angular acceptance, variable beam cross section, adjustable bandpass, and increased flux for self-filtering monochromators are presented, and various considerations in implementation are discussed. Finally, the possibilities for exploiting the unused reflected x rays will be explored.

43161 Beamline X-11A at the NSLS: A unique facility for x-ray absorption spectroscopy. Heald, S. M. (Department of Applied Science, Brookhaven National Laboratory, Upton, New York 11973 (US)); Sayers, D. E. *Review of Scientific Instruments (USA),* 60(7): 1932-1935 (Jul 1989). DOE Contract AS05-80ER10742.

The design and operation of beamline X-11A at the NSLS is described. It employs a unique optical design using a two/four crystal monochromator and a SiC collimating mirror. In either the two- or four-crystal mode a sagittal focusing crystal allows collection of up to 5 mrad of horizontal divergence. Two techniques for rapid scanning of a sagitally focusing crystal will be described and compared. These are dynamically bending the crystal during the scan or translating a fixed radius bent crystal in a manner to maintain a fixed focus on the sample. The flexibility of this two/four crystal design allows the intensity and/or resolution of the beamline to be optimized for particular experiments.

43162 LSU Center for Advanced Microstructures and Devices. Craft, B. C. (CAMD Project Office, Louisiana State University, 60 University Lakeshore Drive, Baton Rouge, Louisiana 70803 (US)); Findley, A. M.; Findley, G. L.; McGlynn, S. P.; Scott, J. D.; Watson, F. H. *Review of Scientific Instruments (USA),* 60(7): 2144-2147 (Jul 1989).

The LSU Center for Advanced Microstructures and Devices (CAMD) is a DOE-funded materials science and engineering laboratory which will include a normal-conducting compact electron storage ring optimized for the production of soft x rays. The focus of CAMD is the fundamental study of processing and analysis technologies—including x-ray lithography—important to microstructure fabrication and electronic device development. Design details of the storage ring, which is being acquired commercially, are presented in this article.

43163 Parameter choices for the SSC. Peterson, J. M. (SSC Central Design Group (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2240-2254 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

The design of the superconducting super collider has followed from the basic requirement that it produce observable reactions among the elementary constituents of matter at as high an energy as now possible. The basic design parameters are that proton beams of 20 TeV be brought into collision at six interaction points in such a way as to produce a luminosity of 10^{33} cm^{-2} s^{-1} per collision point. (AIP)

43164 The SSC project. Peoples, J. (SSC Central Design Group, Lawrence Berkeley Laboratory, Berkeley, California 94720 USA (US)). *AIP (American Institute of Physics) Conference Proceedings (USA),* 184(2): 2227-2239 (5 Apr 1989). (CONF-8707208–: U.S. Particle Accelerator School: physics of particle accelerators, Batavia, IL (USA), 20 Jul - 14 aug 1987).

The SSC is a 20-TeV, proton-proton collider proposed for construction by the U.S. Department of Energy (DOE). Completion is planned for the mid-1990s. A technical description of the accelerator is given along with a report on the status of the project.

43165 Feasibility study into the use of mechanical choppers to alter the natural time structure of the APS. Mills, D. M. (Advanced Photon Source, Argonne National Laboratory, Argonne, Illinois 60439 (US)). *Review of Scientific Instruments (USA),* 60(7): 2338-2341 (Jul 1989). DOE Contract W-31-109-ENG-38.

In standard operating mode, the Advanced Photon Source (APS) is projected to be with 20 equally spaced bunches of positrons separated by 177 ns. This time structure may not be optimal for all experiments, particularly those experiments that require long periods (microseconds to milliseconds) of darkness preceding and/or succeeding the x-ray burst. As a result, an ongoing study is being made into the possibility of altering the natural time structure of the x-ray bursts from the APS. One possibility is through the use of fast kicker magnets (wobblers). A more passive approach is through the use of high-speed mechanical choppers. Using choppers rotating between 18 000 and 20 000 rpm (typical rotational speeds for currently operational neutron choppers), a single burst of x rays can be passed while blocking the surrounding bursts. Interpulse periods are adjustable from approximately 3 to 300 μs depending on the slit configuration of the chopper wheels. Even longer periods of darkness can be achieved by using phased choppers and/or mechanical shutters.

43166 (AECL–9341) **Review of tritium-in-water monitors.** Surette, R.A.; McElroy, R.G.C. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Nov 1986. 13p. Order Number DE89635583/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The current status of tritium-in-water monitors is reviewed. It is argued that the main short-coming of existing tritium-in-water monitors is imperfections in the sample delivery. Most of the liquid and solid scintillation detectors are adequately sensitive for real time monitoring applications. Although other techniques for detecting tritium-in-water are possible they all suffer from the same sample delivery problems and are either insensitive, costly, complicated or not applicable for real time monitoring. 25 refs.

43167 (AERE-M–3736) **Development of a computer program to determine the pulse-height distribution in a gamma-ray detector from an arbitrary geometry source -feasibility study.** Currie, G.D.; Marshall, M. UKAEA Harwell Lab. (UK). Environmental and Medical Science Div. Mar 1989. 17p. Order Number DE89635585/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The feasibility of developing a computer program suitable for evaluating the pulse-height spectrum in a gamma-ray detector from a complex geometry source has been examined. A selection of relevant programs, Monte Carlo radiation transport codes, have been identified and their applicability to this study discussed. It is proposed that the computation be performed in two parts: the evaluation of the photon fluence at the detector using a photon transport code, and calculation of the pulse-height distribution from this spectrum using response functions determined with an electron-photon transport code. The two transport codes selected to perform this procedure are MCNP (Monte Carlo Neutron Photon code), and EGS4 (Electron Gamma Shower code). (Author).

43168 (IFVE-OEA–88-47) **Fast recording and triggering electronics for experiments at IHEP.** Bushnin, Yu.B.; Van'ev, V.S.; Goncharov, P.I. and others. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij. 1988. 19p. (In Russian). Order Number DE89635582/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The organization of electronic system designed for recording and fast reading out of information from multichannel detectors in experimental setups at IHEP is described. Such a structure provides possibilities to select and readout non-zero information to reduce and transmit it with 100ns/word cycle. Besides the system can produce triggering signals and output data filtration from recording electronics. 7 refs.; 6 figs.; 4 tabs.

43169 (INIS-mf–11473) **Calibration of instrument and personnel monitoring in radiological protection.** Abdul Aziz Mohamad Ramli; Wan Saffiey Wan Abdullah. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). 1987. 29p. (CONF-8711314–: Seminar on the application of nuclear techniques in industry, 17 Nov 1987). Order Number DE89635567/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI.

It is difficult to choose radioprotection equipments that are not too expensive and suit the purpose. Some of the dosimetric characteristics of good dosemeters outlined by ISO 4071-1978 (E) namely scale linearity, energy dependence, radiation quality dependence and angular dependence for some of the commercially available dosemeters are discussed. The calibration procedures practised at the National Secondary Standard Dosimetry Laboratory (SSDL), of the Nuclear Energy Unit (NEU) is also explained. The radiological equipments for personnel monitoring such as film badge and TLD are widely used to estimate the radiation dose delivered to the whole or partial body of a personnel. Both of the personnel monitoring procedures have been established at the NEU. The objective, use and maintenance of the devices are also discussed in detail. The evaluation of the monthly dose received by a personnel from various establishments in the country are also presented. (author). 17 figs.

43170 (INIS-mf–11475) **Nuclear instrument maintenance and technical training in Nuclear Energy Unit.** Mohamad Nasir Abdul Wahid. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). 1987. 17p. (CONF-8711314–: Seminar on the application of nuclear techniques in industry, 17 Nov 1987). Order Number DE89635568/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI.

Instrument maintenance service is a necessity in a Nuclear Research Institute, such as the Nuclear Energy Unit (NEU) to ensure the smooth running of our research activities. However, realising that maintenance back-up service for either nuclear or other scientific equipment is a major problem in developing countries such as Malaysia, NEU has set up an Instrumentation and Control Department to assist in rectifying the maintenance problem. Beside supporting in house activities in NEU, the Instrumentation and Control Department (I and C) is also geared into providing services to other organisations in Malaysia. This paper will briefly outline the activities of NEU in nuclear instrument maintenance as well as in technical training. (author).

This paper describes a design for a high magnification 5-element electrostatic lens which focuses ions into a 90 degree spherical sector analyser. High magnification ion optics is desirable since it reduces the background signal in SIMS spectra. This allows lower concentrations of trace elements to be detected thus giving more dynamic range; gives the possibility of imaging surfaces by SIMS; allows separate ion and electron beams to be focussed on to the same area of the sample; and permits depth profiling to be done with high degree resolution without the need of raster gating. This may be important for profiling over large depths where raster gating in not desirable or possible, e.g. in sputter neutral mass spectrometry.

In general, a spontaneous fission half life measurement involves determining the mass of the spontaneously fissioning isotope present, and the associated fission rate. Although the mass of the isotope can be measured with high accuracy and relative ease, the fission rate measurement is far more difficult. Measurement of the fission rate has, in the past, always involved direct fragment counting using some form of gas-filled ionisation chamber. For isotopes with very long spontaneous fission half lives ($>10^{10}$ years) this becomes difficult because of alpha pile-up within the ionisation chamber. To overcome this, we propose a technique based the detection of the neutrons emitted in spontaneous fission. This technique is an extension of our safeguards instrumentation program. In particular, the basic technique is utilised in a prototype safeguards instrument for the non-destructive assay of plutonium.

43198 (INIS-mf–11495, pp. 197-198) **Low level gamma spectrometry by high speed digital sampling.** McMillan, P.T. (New South Wales Univ., Kensington (Australia). School of Physics); Kelly, J.C. Australian Inst. of Nuclear Science and Engineering, Lucas Heights (Australia). Nov 1987. (CONF-8711240–: Australian joint artificial intelligence conference, Sydney (Australia), 2-4 Nov 1987). Thermoluminescent dating usually involves estimation by dosimetry of environmental radiation. We use a NaI(Tl) crystal detection system in a massive Pb and Fe castle. Signal conditioning involves the usual preamplification, pulse shaping, discrimination and dedicated MCA. The successful use of a Phoswich detector (NaI(Tl) + CaF2(Eu)) for beta/gamma discrimination usually involved further stages of pulse processing and manipulation relying on the different pulse shape characteristics resulting from the different scintillator relaxation times (250 ns and 1000 ns respectively). The prospect of needing several NIM racks (Nuclear Instrument Modules) packed with various modules, all of which require tuning, has induced us to have another look at the overall problem of data collection and data analysis for low-level gamma counting, i.e. one event per second.

In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The device to measure the lifetime (decay constants) by the convolution method in experiments with the background is described. The technique of measuring the lifetime by the convolution method is presented and the examples of its application for background measurements are given. The efficiency of using the above technique and the device developed to measure the lifetime of nuclei composing radioactive sources of complex isotopic composition is shown. The procedure of calculating the errors of lifetime values found is discussed, the results of the convolution method and those obtained by conventional technique, are compared. 3 refs.; 3 figs.

In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The technique of the objective quantitative comparison of peak searching programs based on the calculation of the conventional probability of the true peak detection D in cases of fixed and similar value of conventional probability of their false detection F for the programs considered, is suggested. The technique and the procedure of comparing the quality of peaksearch programs is described and the results of comparison of the known programs of peak identification are given. 11 refs.; 1 fig.

43206 (INIS-SU–100, pp. 139-142) **Calculation of the potential precision of the peaks parameters determination by the maximum likelihood fit.** Gopych, P.M. (Khar'kovskij Gosudarstvennyj Univ., Kharkov (Ukrainian SSR)). AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

General expressions to calculate potential errors when determining peak parameters from the composition of multiplets of any complexity are obtained by the maximum likelihood fit within the framework of the linear stochastic spectrum model suggested. The formulae for potential errors in the determination of single peak parameters are obtained from the general expressions for the simpliest partial case, i.e. single peak (singlet) on the constant background. These formule are compared with the empirical formulae. It is shown that all results agree within the range of their application. 3 refs.

43207 (INP–1302/PS, pp. 21-46) **NORD BALL - an effective system for the detection of gamma radiation in nuclear reactions.** Ryde, H. (Lund Univ. (Sweden). Dept. of Cosmic and Subatomic Physics). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The recent development of efficient detector systems mainly for gamma-ray spectroscopy is discussed and the ideas behind the NORD BALL project, which is a joint Nordic effort to design and construct such an effective and versatile detector system intended for use in experiments at different accelerator laboratories is presented. A few words about the accelerator situation in the Nordic countries is said so as to give you a background for the possible future experiments with the use of the NORD BALL detector system. 6 refs., 12 figs., 2 tabs. (author).

43208 (INS–739) **Broad range spectrometer PIK for medium-energy meson spectroscopy.** Akei, M.; Amann, J.F.; Chiba, J. and others. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Mar 1989. 38p. (OULNS–88-11). Order Number DE89906505/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

A broad range spectrometer PIK has been constructed for the study of Λ hypernuclei via the (π^+, K^+) reaction. The spectrometer can be also used for nuclear spectroscopy with medium-energy meson beams. It consists of two independent spectrometers: one

analyzes the incident beam momentum, and the other determines the momentum of the scattered particle. The latter spectrometer is characterized by a large solid angle of 15 - 22 msr, a broad range momentum acceptance of 0.55 - 1.1 GeV/c, a wide angular acceptance of 11deg, and a short flight path length of 4.5 m. The scattered particle is identified by the use of silica aerogel Cerenkov counters and lucite Cerenkov counters and by measuring its time-of-flight. Performance of the spectrometer is examined by the (π^+, K^+) reaction on ^{12}C target at P_π = 1.05 GeV/c and by the (π^+, P) reaction on a CH_2 target. (author).

43209 (ISN–88-101) **Realization of an apparatus for the synthesis and detection of carbon 11 labelled fatty acids and of a data acquisition system for the study of the myocardial methabolism of radiopharmaceuticals.** Fressonnet, G. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. 1988. 260p. (In French). Order Number DE89908212/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

This thesis describes the study and the realization of an apparatus to synthesize fatty acids labelled with carbon 11, a radioactive isotope with an half-life of 20.38 minutes. A system of gamma-ray detection with data processing designed for the study of the myocardiac metabolism of radiopharmaceuticals using isolated rat hearts as experimental models. The synthesis of carbon 11 labelled fatty acids required a preliminary study of the manufacture of this isotope at the synchrocyclotron of the I.P.N. (Lyon). The method chosen is the nuclear reaction (d,xn) with naturally occurring boron trioxide as the target. The apparatus was designed so as extract carbon 11 from the target in the form of $^{11}CO_2$ which can then be used in the synthesis of carbon 11 labelled hexadecanoique, heptadecanoic and beta-methyl hexadecanoic acids. The time scale of this synthesis must be compatible with the short half-like of the isotope. In order to study these compounds 'in vivo' on the experimental model of isolated rat hearts, a system of detection, which functions either in a simple gamma mode or in a gamma-gamma coincidence mode, was developed. This apparatus can attain a rate of approximately 50 000 counts/sec. per channel, thus it is possible to obtain information about rapid phases of metabolism with a satisfactory statistical precision. Moreover the spectral analysis of the gamma-ray permits the simultaneous detection of different radioisotopes. Hence it was possible to compare the behaviour of carbon 11 labelled fatty acids with homologous molecules marked with iodine 123. The analysis of the experimental results was achieved witha computer based on an I.B.M. compatible PC-XT. The essential parts of this system are a data-acquisition card for the PC, code for the acquisition and the data processing.

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki. 1988. 12p. (In Russian). Order Number DE89635586/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Results of experiments on detecting gamma-quanta in 14.4-661.6 keV range using detectors comprising two microchannel domestic production 34mm diameter plates in a chevron-type composition are described. The detectors operate well at indoor and low temperatures down to 4.2 K. Data on count number dependence on the voltage on the detector both for background and noise pulses and signals conditioned by gamma-quanta are presented. On comparing amplitude pulse spectra conditional by different energy gamma quanta it is determinated that lower energy photon detection leads to a higher mean pulse amplitude. 2 refs.; 6 figs.

43211 (ITEF–27(1988)) **Efficiency of gamma detection at different energies by the detector on base of microchannel electron multipliers at low temperatures.** Alpatov, V.G.; Davydov, A.V.; Korotkov, M.M.; Kostina, G.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Teoreticheskoj i Ehksperimental'noj Fiziki. 1988. 13p. (In Russian). Order Number DE89635587/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Results of measuring the detection efficiency of gamma-quanta with different energy using a standard domestic production chevron-type assembly of 2 microchannel plates 32-12 at indoor and low (173K) temperatures are presented. Observed qualitative similarity od dependences of gamma-quantum detection efficiency using a detector and complete secondary fast electron yield on the energy testifies to the fact that detection efficiency is mainly determined by secondary electron yield. Efficiency decrease under cooling down to 173 K is insufficient and makes up several per cent for a wide energy interval. Noises for the given assembly are about 150 times reduced. 14 refs.; 4 figs.

43212 (KEK–88-9, pp. 127-143) **Chopper spectrometers at the ISIS facility.** Taylor, A.D. (Rutherford Appleton Lab., Chilton (UK)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The report describes the performance of the High Energy Inelastic Spectrometer HET at ISIS and gives some rational behind the design of its sister spectrometer MARI which is being built. The HET spectrometer is a direct geometry chopper spectrometer designed specifically to study systems at high energy transfer ϵ with low associated momentum transfer Q and good energy transfer resolution $\Delta\epsilon$. This is achieved by monochromating at high incident energies (100 $\sim$ 2000 meV) and scattering at low angles (3 $\sim$ 30deg). In the spectrometer, the standard ISIS primary collimation system is used which consists of B_4C beam-defining irises alternating with borated-resin/iron-shot spacers. After the monochromating chopper, a further set of B_4C irises (which can be easily changed) limits the beam area to 5 x 5 cm^2 and prevents the lowest angle detectors from directly viewing the chopper. The monochromating chopper, located 10 m from the source, spins on magnetic bearings at frequencies up to 600 Hz and produces a sharp ($\sim$1 μs) burst of neutrons on the sample. The background supressing chopper blocks the beam during the power pulse with 30 cm long bar of nimonic alloy 6 x 6 cm^2 in cross-section and prevents fast neutrons from entering the spectrometer. Scattered neutrons are detected 4 m from the sample in a low angle array (3 $\sim$ 7deg) of ^3He gas tubes, at 4 m in a high angle array (136deg) and at 2 m in an intermediate angle array (10 $\sim$ 30deg). (Nogami, K.).

43213 (KEK–88-9, pp. 144-161) **Chopper spectrometer INC ad KENS.** Arai, Masatoshi (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Watanabe, Noboru; Ikeda, Susumu; Kohgi, Masahumi; Itoh, Masayuki; Iwasa, Hirokatsu; Endoh, Yasuo. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The report discusses a spectrometer called INC, which is under construction at the KENS, aiming at neutron scattering with the energy transfer from 20 to 1000 meV and the momentum transfer from 0.3 to 40 A^{-1}. The most important problem in designing the spectrometer was the restriction of the available space in the experimental hall. Only 7m was available for the flight path out of the bulk shield of 4m thick. An effort was made to find optical parameters to achieve better performances under this restriction. Taking into account the actual constraint, it was decided to adopt a horizontal layout rather than a vertical one and the parameters L1=7m, the distance between moderator and monochromating chopper, L2=1.3 or 2.5m, between sample and detector, and L3=1m, between chopper and sample. L2 is 2.5m for the scattering angle 5-40deg, while 1.3m for 40-130deg. These parameters satisfy most of the required performances. The monochromating chopper is almost the same as that of the MARI. To supress delayed fast neutrons from the uranium target as well as fast burst neutorns, a background supression

chopper is indispensable for INC. A mechanical chopper system is currently under development for this purpose. The inner collimator in the bulk shield and the outer collimator between two choppers consist of sintered B_4C, steel and borated resin (boric-acid 40%, polyethylene-beads 40%, epoxy-adhesive 20% in weight) making an image 6 x 6 cm^2 at the sample position. (N.K.).

43214 (KEK–88-9, pp. 197-201) **Polarized white neutron diffraction at PEN spectrometer.** Ohoyama, K. (Tohoku Univ., Sendai (Japan). Dept. of Physics); Fujimoto, H.; Kohgi, M. National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The Polarized Epithermal Neutron Spectrometer PEN at KENS is designed to utilize the polarized white (thermal to epithermal) neutrons for the studies of the scattering phenomena which depend on the incident neutron polarization. The neutron polarization is achieved by passage through a dynamically polarized proton filter (DPPF). The present study aims to measure the magnetization of γFeNi alloy ultra fine particles UFP by polarized neutron diffraction technique in order to investigate the size effect on the Invar anomaly as the particle size becomes very small. From the relations for the intensities of the Bragg peaks for polarized neutrons, it is derived that $(I^+ + I^-)$ and $(I^+ - I^-)$ are proportional to $2(b^2+P^2)$ and $4bpP$, respectively, where b is the nuclear coherent scattering length, $p = (\gamma e^2/2mc^2)\mu f(k)$ the magnetic scattering length, μ the magnetic moment per atom, f(k) the magnetic form factor, and P the neutron polarization. The first relation corresponds to unpolarized neutron diffraction, and the second, which corresponds to the coherence between the nuclear and magnetic scattering, is useful for determination of the magnetic moment of atoms. The magnetic moment per atom of γFeNi UFP is obtained by fitting the above relations to the sum and difference of the observed I^+ and I^- data by the profile fitting (Riedveldt) technique. The magnetic moments of γFeNi UFP are found considerably larger than those of the bulk alloys. (N.K.).

43215 (KIYI–88-11) **$CdWO_4$, ZnSe, $ZnWO_4$ for investigations of 2 β processes.** Danevich, F.A.; Zdesenko, Yu.G.; Nikolajko, A.S. and others. AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij. 1988. 19p. (In Russian). Order Number DE89635573/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

It was studied and improved the spectrometric characteristics of scintillators $CdWO_4$, ZnSe, $ZnWO_4$ by means of which the search of 11 double-beta transitions of isotopes Zn,Cd,Se,W may be carried out. From the preliminary measurements of background $CdWO_4$ the limits of half-life period of ^{186}W, ^{114}Cd, ^{116}Cd were established with respect to neutrinoless mode of double-beta decay correspondently equal to $9x10^{18}$, $1x10^{19}$ and $1,3x10^{19}$ years. The possibilities of sensitivity increase of experiments on double-beta decay up to level of 10^{22} years were estimated. 10 refs.; 5 figs.; 6 tabs.

43216 (LA-UR–89-2375) **Monte Carlo calculations of the vacuum Compton detector sensitivities.** Hsu- Hsiao-Hua; Lee, Huan. Los Alamos National Lab., NM (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890723–12: 26. annual conference on nuclear and space radiation effects, Marco Island, FL (USA), 24-28 Jul 1989). Order Number DE89015263/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Monte Carlo simulations have been carried out to compute the static sensitivity of the vacuum Compton detector for monoenergetic gamma rays and electrons. A similar calculation using ^{60}Co spectrum as input is found in good agreement with measurements. We also calculate the detector sensitivities for bremsstrahlung spectra produced by monoenergetic e-beam and compare with experimental data. 8 refs., 6 figs.

43217 (LA-UR–89-2382) **Working with some of the newer high-Z scintillators.** Laros, J.G. Los Alamos National Lab., NM (USA). [1989]. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890836–3: 33. SPIE annual international technical symposium on optical and optoelectronic applied science and engineering, San Diego, CA (USA), 6-11 Aug 1989). Order Number DE89015261/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have performed simple laboratory studies of several of the newer high-Z inorganic scintillators, with a primary goal of evaluating their relative merits as sensors for space-borne instruments. It is appropriate to consider using one of these materials when light output can be exchanged for some other beneficial property, such as higher stopping power (bismuth germanate), superior resistance to radiation damage (barium fluoride), or fast decay time (barium fluoride and pure cesium iodide). Our work has revealed or confirmed important characteristics – both favorable and unfavorable – of these newer scintillators. For example, the temperature dependence and particle species dependence of the fast and slow scintillation output of barium fluoride and pure cesium iodide will be described. 6 refs.

43218 (LA-UR–89-2404) **Report on the performance and operating characteristics of the Burle C83061E QUANTACON™ photomultiplier tube.** Sandberg, V.D.; Thompson, T.N.; Helvy, F.A. Los Alamos National Lab., NM (USA). 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8905193–1: Workshop on physics and experimental techniques of high energy neutrinos and VHE and UHE gamma-ray particle astrophysics, 11-13 May 1989). Order Number DE89015257/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Burle C83061E QUANTACON™ is a 10.4 inch diameter photomultiplier tube with improved photoelectron collection optics. We report here on the first tests of this newly developed tube. We find the single photoelectron charge resolution to be excellent, with a peak to (noise) valley ratio exceeding 3 and with a transit time spread of less than 2.3 ns (FWHM) for full photocathode illumination at the single photoelectron level. A design for a fast anode pulse base is also presented. 11 refs., 8 figs.

43219 (LBL–27327) **Nonuniformities in organic liquid ionization calorimeters.** Wenzel, W.A. Lawrence Berkeley Lab., CA (USA). Jun 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890379–13: Workshop on calorimetry for the SSC, Tuscaloosa, AL (USA), 13-17 Mar 1989). Order Number DE89015346/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Hermeticity and uniformity in SSC calorimeter designs are compromised by structure and modularity. Some of the consequences of the cryogenic needs of liquid argon calorimetry are relatively well known. If the active medium is an organic liquid (TMP, TMS, etc.), a large number of independent liquid volumes is needed for safety and for rapid liquid exchange to eliminate local contamination. Modular construction ordinarily simplifies fabrication, assembly, handling and preliminary testing at the price of additional walls, other dead regions and many nonuniformities. Here we examine ways of minimizing the impact of some generic nonuniformities on the quality of calorimeter performance. 6 refs., 7 figs.

43220 (LBL–27457) **Applications of a-Si:H radiation detectors.** Fujieda, I.; Cho, G.; Conti, M.; Drewery, J.; Kaplan, S.N.; Perez-Mendez, V.; Qureshi, S.; Street, R.A. Lawrence Berkeley Lab., CA (USA). Jul 1989. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890861–1: 13. biennial international conference on amorphous and liquid semiconductors (ICALS-13) and the first international conference on amorphous semiconductor technology (ICAST-1), Asheville, NC (USA), 21-26 Aug 1989). Order Number DE89015230/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Device structures and operation principles are described for detecting various kinds of radiation with hydrogenated amorphous silicon (a-Si:H) layers. With some new configurations such as the buried p-i-n structure and the use of interdigitated electrodes, the a-Si:H radiation detectors will find their applications in many fields of science. Some applications in high energy physics, medical imaging, materials sciences and life sciences are discussed in this paper. 41 refs., 7 figs., 1 tab.

43221 (LYCEN–89-03) **Using the combination CsI(Tl) + photodiode for identification and energy measurement of light particles.** Guinet, D.; Chambon, B.; Cheynis, B.; Demeyer, A.; Drain, D.; Hu, X.C.; Pastor, C.; Vagneron, L.; Zaid, K.; Giorni, A. Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire. 1989. 6p. Order Number DE89908106/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

The feasibility of discriminating light charged particles in charge and mass using the CsI(Tl) + photodiode combination is demonstrated. Experiment layout and results for a test using a beam of 30 MeV/nucleon α particles impinging on self-supporting gold and aluminium targets are shown.

43222 (NCS-R–3) **Proceedings of the symposium on thermoluminescence dosimetry.** Aalbers, A.H.L. (National Institute of Public Health and Environmental Protection, Bilthoven (Netherlands)); Bos, A.J.J. (Interuniversitair Reactor Inst., Delft (Netherlands)); Mijnheer, B.J. (Nederlands Kanker Inst. 'Antoni van Leeuwenhoekhuis', AmsterdamNederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. 152p. Includes index of authors.

In thi proceedings volume papers have been collected dealing with theoretical and practical aspects of thermoluminiscence dosimetry (TLD). (H.W.).

43223 (NCS-R–3, pp. 79-84) **Thermoluminescence dosimetry at Eindhoven University of Technology.** Hemelaar, J.T. (Eindhoven University of Technology (Netherlands). Health Physics Division); Kicken, P.J.; Huyskens, C.J. Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. (CONF-8803227–: Symposium on thermoluminescence dosimetry, Bilthoven (Netherlands), 30 Mar 1988). In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

This paper gives an outline of organizational aspects and technical features of the thermoluminiscence dosimetry system of the eindhoven University of Technology. (H.W.). 3 figs.

43224 (NCS-R–3, pp. 5-15) **Mechanisms of thermoluminiscence production in LiF:Mg,Ti (TLD-100).** Bos, A.J.J. (Interuniversitair Reactor Inst., Delft (Netherlands)). Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. (CONF-8803227–: Symposium on thermoluminescence dosimetry, Bilthoven (Netherlands), 30 Mar 1988). In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

Lithium fluoride with magnesium and titanium and available under the name TLD-100 is one of the most popular thermoluminiscent (TL) materials used in radiation dosimetry. In this review the mechanism is described of TL production in TLD-100 from the viewpoint of the user. (H.W.). 17 refs.; 6 figs.; 1 tab.

43225 (NCS-R–3, pp. 17-24) **Some experimental observations on the supralinearity of the response of TLD-100 in the radiotherapeutic dose range.** Mijnheer, B.J. (Nederlands Kanker Inst. 'Antoni van Leeuwenhoekhuis', Amsterdam (Netherlands)); Weeda, J. Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. (CONF-8803227–: Symposium on thermoluminescence dosimetry, Bilthoven (Netherlands), 30 Mar 1988). In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

In order to obtain a high decree of accuracy (<=5%, one standard deviation) when using thermoluminiscence dosimetry (TLD) in the clinic, a number of tests is required, of which one refers to the relationship between dose and TLD reading. Supralinearity in the response of several TLD materials occurs at doses above a few Gy. For LiF TLD-100, onset values of thermoluminiscence supalinearity varying from 1 to 10 Gy have been reported. In this contribution the results of measurements are described of supralinearity for the response of TLD-100 at doses below 5 Gy using different read-out and different annealing procedures. (H.W.). 11 refs.; 4 figs.

43226 (NCS-R–3, pp. 25-30) **Supralinearity and dependence on energy of LiF 700 powder response for photons and electrons.** Marijnissen, J.P.A. (Dr. Daniel den Hoed Cancer Centre, Rotterdam (Netherlands)); Goebel, B. Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. (CONF-8803227–: Symposium on thermoluminescence dosimetry, Bilthoven (Netherlands), 30 Mar 1988). In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

Thermolumiscence dosimetry (TLD) using LiF 700 powder is applied for the measurement of dose distributions in phantoms as well as patients. The LiF powder is calibrated against a 0.6 cms thimble ionization chamber in a 4 MV photon beam at a reference test dose of 1 Gy. The TL response/unit dose is considered as the calibration factor for this particular dose and radiation quality. TL-response to dose conversion for TLD measurements at other radiation qualities and doses requires adequate knowledge of the TL properties of the TL-material, i.e. the supralinearity and dependence on energy of the LiF 700 response. Supralinearity and energy dependence for average photon energies of 45 keV - 12 MeV and for electrons with initial energies of 4-32 MeV have been studied. In this paper preliminary results are given with emphasis on the difference in response in high energy electrons and high energy photon beams. (H.W.). 10 refs.; 2 figs.; 1 tab.

43227 (NCS-R–3, pp. 31-36) **Computerized analysis of glow curves from LiF:MgZTi (TLD-100).** Vries, W. de (Interuniversitair Reactor Inst., Delft (Netherlands)); Hoogenboom, J.E.; Dilehof, J.B.; Bos, A.J.J. Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. (CONF-8803227–: Symposium on thermoluminescence dosimetry, Bilthoven (Netherlands), 30 Mar 1988). In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

Computerized glow curve analysis is an advanced technique used to study various parameters associated with the charge transfer that occurs during thermoluminescence emission. A computer program has been developed to analyze complex glow curves, based upon a non-linear least-squares program. The program decomposes a measured glow curve into a number of different glow peaks, each of them described by four physical parametres of the thermoluminescence (TL)-process involved: the order of kinetics of the process, the trap depth, a frequency factor, and the number of traps. In this study the applicability of this computer program for analyzing glow curves of LiF: Mg, Ti (TLD-100) in routine dosimetry has been investigated. A prerequisite using computerized glow curve analysis in routine TL dosimetry is a model of the TL-process that describes the shape of the glow curve exclusively in terms of the dose, i.e. a model which is independent of the experimental and/or radiation field parameters. In this investigation the constancy of the various model parameters for differnt radiation types, energies and doses are studied. (H.W.). 11 refs.; 3 figs.; 2 tabs.

43228 (NCS-R–3, pp. 37-42) **Carbon loaded dosemeters for the measure of the shallow dose equivalent due to beta-radiation.** Preston, H.E. (Vinten Instruments Ltd., Weybridge (United Kingdom)). Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. (CONF-8803227–: Symposium on thermoluminescence dosimetry, Bilthoven (Netherlands), 30 Mar 1988). In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

A type thermoluminiscence dosemeter is presented which is phycically thick enough for ease of handling and length of useful life, while it behaves to radiation as if it where thin. (H.W.). 4 refs.; 3 figs.; 1 tab.

43229 (NCS-R–3, pp. 43-48) **Does the most sensitive thermoluminiscent material come from China?. Some characteristics of LIF: Mg.Cu.P (GR-200) TL chips.** Bos, A.J.J. (Interuniversitair Reactor Inst., Delft (Netherlands)); Dielhof, J.B. Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands). Oct 1988. (CONF-8803227–: Symposium on thermoluminescence dosimetry, Bilthoven (Netherlands), 30 Mar 1988). In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

Presented are the results of a study of some dosimetric characteristics of chip consisting of solid LiF phosphor activated with Mg, Cu and P, a highly sensitive thermoluminiscence (TL) material (GR-200 chips), in order to verify the claims of the manufacturer. (H.W.). 8 refs.; 4 figs.; 4 tabs.

43230 (NCS-R–3, pp. 51-60) **TNO individual monitoring service based on TLD concepts and methodology.** Julius, H.W. (TNO, Netherlands Organization for Applied Scientific Research, Arnhem (Netherlands) Radiological Service TNO); Busscher, F.A.I.; Verhoef, C.W. In *Proceedings of the symposium on thermoluminescence dosimetry.* Order Number DE89633653/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

Includes index of authors.

In 1981 a research project was initiated at the KEMA department of Environmental Research, concerning a new environmental thermoluminiscence dosimetry (TLD) system. This project consisted of several parts: - requirements of the TLD-system - a comparative study of commercially available TLD-materials - evaluation of a measureing procedure for a routine monitoring programme. On the basis of the reslts of this project, KEMA advised the nuclear power stations to perform their environmental monitoring with a combination of a CaF 2 TLD's (Harshaw's TLD-200) and the automatic TNO TLD-reader. The next step in the development was to turn the laboratory set-up into an operational TLD-system. The development included the design of new TLD-holders. T D pick-out platforms, a readout table, electronics, automation of the TLD readout cycle, and automation of the data manipulation. (author). 4 figs.

Includes index of authors.

The relative sensitivity of thermoluminiscent dosimeters (TLD) is defined as the ratio of the sensitivity of the TLD to neutrons and the sensitivity of the TLD to Co-60 photons. In this paper the variation of the relative sensitivity of Lithium-7 Fluoride (TLD700) as a function of the neutron energy and the depth of irradiation in a phantom is studied. (H.W.). 10 refs.; 3 figs.

A very small detector is needed for heavy ion radial distance microdosimetry since a small detector makes it possible to simulate somewhat smaller site sizes while maintaining secondary charged particle equilibrium in a vacuum chamber of reasonable size. The smaller actual size of the detector also allows it to measure energy deposition in volumes situated over a wider range of distances from the path of the primary heavy ion than was possible before. The other type of microdosimetric measurement in which a smaller configuration is important is that of accelerator-produced neutrons. Because the energy and fluence of these neutrons are a function, in part, of the solid angle subtended by whatever is being irradiated, it is best to use as small a detector as possible. A new detector has been designed and one prototype constructed.

43241 (RAL–89-030) **Measurement and prediction of the drift-distance/drift-time relationship of a small jet chamber operated with carbon dioxide/isobutane.** Carter, J.R.; Elcombe, P.A.; Hill, J.C. and others. Rutherford Appleton Lab., Chilton (UK). May 1989. 32p. Order Number DE89635588/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.
Submitted for publication to Nuclear Instruments and Methods in Physics Research.

As part of the preliminary studies for the vertex jet chamber of OPAL a small prototype chamber has been operated using carbon dioxide /isobutane and argon/ethane. A nitrogen laser has been used to produce an ionizing track in the chamber at a distance to the sense-wire plane that could be varied by means of a quartz pentaprism attached to a micrometer. This has enabled the drift-distance/drift-time relationship to be measured with an accuracy of 5-10μm. The drift-distance/drift-time relationship has also been predicted from calculations of the electric field configuration inside the chamber and of the electron drift-velocity as a function of electric field. Measurements and predictions agree to the level of $\sim$ 10μm, thus demonstrating the feasibility of drift-distance/drift-time predictions for the final vertex jet chamber of OPAL, for which detailed laser measurements will not be possible. Corrections to the drift-distance/drift-time relationship for small variations in pressure, temperature and gas composition have also been predicted and shown to be in agreement with experimental measurements. As an alternative to the separate measurement of pressure, temperature and gas composition, it has been demonstrated that a direct measurement of the drift-velocity at one point in the chamber enabled the corrections to the drift-distance/drift-time relationship over the entire chamber volume to be calculated to the $\sim$ 10μm level. (Author).

43242 (SLAC-PUB–5028) **The SLD [SLC Large Detector] calorimeter systems.** Benvenuti, A.C.; Piemontese, L.; Calcaterra, A.; De Sangro, R.; De Simone, P.; Peruzzi, I.; Piccolo, M.; Burrows, P.N.; Busza, W.; Cartwright, S.L. Stanford Linear Accelerator Center, Menlo Park, CA (USA); Massachusetts Inst. of Tech., Cambridge, MA (USA); Wisconsin Univ., Madison, WI (USA). Jul 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515;AC02-76ER03069;AC02-76ER00881. (CONF-8905194–1: 4. Pisa meeting on advanced detectors: frontier detectors from frontier physics, 21-26 May 1989). Order Number DE89013986/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A brief description is given of the SLD calorimeter system, with emphasis on the iron calorimeter/muon identifier. Design choices and expected performance are summarized. 6 refs., 8 figs.

43243 (SLAC-PUB–5041) **Tracking with wire chambers at the SSC.** Hanson, G.G.; Gundy, M.C.; Palounek, A.P.T. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 30p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515;AC03-76SF00098. (CONF-8905194–2: 4. Pisa meeting on advanced detectors: frontier detectors from frontier physics, La Biodola (Italy), 21-26 May 1989). Order Number DE89013990/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Limitations placed on wire chambers by radiation damage and rate requirements in the SSC environment are reviewed. Possible conceptual designs for wire chamber tacking systems that meet these requirements are discussed. Computer simulation studies of tracking in such systems are presented. Simulations of events from interesting physics at the SSC, including hits from minimum bias background events, are examined. Results of some preliminary pattern recognition studies are given. 13 refs., 11 fig., 1 tab.

43244 (UCRL–100106) **Multiple gauges for in situ measurements of pressure and particle velocity in condensed materials.** Urtiew, P.A.; Erickson, L.M. Lawrence Livermore National Lab., CA (USA). 14 Jul 1988. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890739–3: 12. international colloquium on the dynamics of explosions and reactive systems, Ann Arbor, MI (USA), 23-28 Jul 1989). Order Number DE89016655/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In situ measurements of pressure and particle velocity have always been crucial in the development of theoretical models and formulation of equations of state for both inert and reactive materials. Formerly, measurements were made with separate gauge stations placed between layers of investigated material stacked in the direction of shock propagation. This arrangement not only generates a disturbance in the flow field but also causes interruption in the chemical reaction process being monitored. The introduction of multiple gauge packages placed on an inclined surface has eliminated most of the problems encountered with separate in line gauge stations. Such multiple gauges provide the capability of measuring changes in pressure and particle velocity at depth intervals much smaller than those between separate gauge stations. In addition each consecutive gauge element is not engulfed in the flow wake of the preceding one. The multiple element gauges described here are ideal for monitoring rapid changes in pressure and particle velocity in processes such as transition to detonation or phase

transformation. With this arrangement in a single experiment one can have as many as twelve signal traces from within a very thin depth in a sample. 20 refs., 9 figs.

43245 Advanced forward calorimetry for the SSC and TeVatron collider. DiBitonto, D. (Texas A and M Univ., College Station (USA)); Van Peteghem, P.M.; Geiger, R.L.; McIntyre, P.M.; Pang, Y.; Thane, J.M.; White, J.T.; Atac, M. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(1/2): 100-106 (1 Jul 1989). DOE Contract AS05-81ER40039. (CONF-8806235–: International conference on advanced technology and particle physics, 12-17 Jun 1988).

We describe a project to develop fast, radiation hardened forward calorimetry for the SSC and TeVatron collider. Detector technologies discussed are based on gas and warm liquid media. In particular, we present the design of an ultrasensitive hybrid charge preamplifier for liquid technology capable of operating at 0.1-1 GHz. The actual detector bandwidth will depend on the choice of detector media used and the maximum allowable operating high voltage. (orig.).

43246 Waveform digitizing at 500 MHz. Atiya, M. (Brookhaven National Lab., Upton, NY (USA). Physics Dept.); Ito, M.; Haggerty, J.; Ng, C.; Sippach, F.W. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(1/2): 180-185 (1 Jul 1989). DOE Contract AC02-76CH00016. (CONF-8806235–: International conference on advanced technology and particle physics, 12-17 Jun 1988).

Experiment E787 at Brookhaven National Laboratory is designed to study the decay $K^+ \rightarrow \pi^+ \nu\text{anti}\ \nu$ to a sensitivity of 2×10^{-10}. To achieve acceptable muon rejection it is necessary to couple traditional methods (range/energy/momentum correlation) with observation of the $\pi^+ \rightarrow \mu^+ \nu$ decay sequence in scintillator. We report on the design and construction of 200 channels of relatively low cost solid state waveform digitizers. The distinguishing features are: 8 bits dynamic range, 500 MHz sampling, zero suppression on the fly, deep memory (up to 0.5 ms), and fast readout time (100 μs for the entire system). We report on data obtained during the February-May 1988 run showing performance of the system for the observation of the above decay. (orig.).

43247 Fast neutron damage in silicon detectors. Kraner, H.W. (Brookhaven National Lab., Upton, NY (USA)); Li, Z.; Posnecker, K.U. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(1/2): 266-271 (1 Jul 1989). DOE Contract AC02-76CH00016. (CONF-8806235–: International conference on advanced technology and particle physics, 12-17 Jun 1988).

Radiation effects of fast neutrons have been measured in silicon detectors of varying resistivity irradiated to $\simeq10^{11}$ n/cm^2 over periods of weeks. The principal damage effect is increased leakage current due to generation of carriers from defect levels in the depletion region. Damage and leakage current constants have been established for detector resistivities between 10 and 27000 Ω cm and lie in the range of (0.7-2)x10^7 s/cm^2 (K) for PuBe neutrons. A slight increase in K was observed for higher resistivities which translates into somewhat improved radiation hardness. A fit of these data was attempted to a two-level recombination formulation of the damage constant. (orig.).

43248 The central tracking detectors for D0. Clark, A.R. (Lawrence Berkeley Lab., CA (USA)); Goozen, F.; Klopfenstein, C.; Kerth, L.T.; Loken, S.; Strovink, M.; Trippe, T.G.; Bantly, J.; Buchholz, D.; Claes, D. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(1/2): 243-248 (1 Jul 1989). DOE Contract AC03-76SF00098;AC02-80ER10699;AC02-76ER02289. (CONF-8806235–: International conference on advanced technology and particle physics, 12-17 Jun 1988).

Three types of drift chambers are being constructed for the Fermilab D0 experiment. The construction and readout of these chambers stress good spatial resolution, good two hit separation, and dE/dx measurement. A 106 MHz FADC system with hardware zero suppression is being constructed to read out this system. (orig.).

43249 The computer controlled VME high voltage system for the D-Zero detector. Droege, T.F. (Fermi National Accelerator Lab., Batavia, IL (USA)); Shea, M.F.; Goodwin, R.W.; Johnson, M.E.; Jones, A.A.; Roberts, K.; Wimpenny, S.J. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(1/2): 359-363 (1 Jul 1989). (CONF-8806235–: International conference on advanced technology and particle physics, 12-17 Jun 1988).

We have designed and prototyped a new VME based high voltage system for the D-Zero experiment at Fermilab. The power supply and control system are both new designs and combined have more flexibility and dynamic range than anything available on the commercial market. (orig.).

43250 D0 muon system with proportional drift tube chambers. Brown, C. (Fermi National Accelerator Lab., Batavia, IL (USA)); Eartly, D.; Green, D.; Haggerty, H.; Hansen, S.; Joestlein, H.; Malamud, E.; Martin, P.; Oshima, N.; Yamada, R. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(1/2): 331-338 (1 Jul 1989). (CONF-8806235–: International conference on advanced technology and particle physics, 12-17 Jun 1988).

The muon detection system for the Fermilab D0 detector is described. It has better muon detection performance than other existing hadron collider detectors, with respect to both hadron attenuation length and position resolution. In the large angle region there are three large magnetized toroids and a total of 10 planes of proportional drift tube chambers made of 10 cm wide cells. At both small angles there are magnetized toroids and 9 planes of proportional drift tubes made of 3 cm diameter stainless steel tubes. The 10 cm wide cell structure is made of specially designed aluminum extrusions, which make the assembly of a whole chamber easy. The chamber is provided with vernier pads so that the position of a charged particle can be simultaneously detected in both directions perpendicular and parallel to the sense wire. The system resolution goal along the wire is ±2.0 mm and perpendicular to the wire ±0.5 mm. (orig.).

43251 The mid-rapidity calorimeter for the relativistic heavy-ion experiment WA80 at CERN. Awes, T.C. (Oak Ridge National Lab., TN (USA)); Baktash, C.; Cumby, R.P.; Ferguson, R.L.; Gabriel, T.A.; Johnson, J.W.; Lee, I.Y.; Obenshain, F.E.; Plasil, F.; Young, G.R. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(3): 479-502 (15 Jul 1989). DOE Contract AC05-84OR21400;AC03-76SF00098.

A sampling calorimeter designed for use at mid-rapidity in the relativistic heavy-ion experiment WA80 at CERN is described. Calibration and performance results are presented. Over the energy range of 2 to 50 GeV, the response of the mid-rapidity calorimeter was linear, and its energy resolution σ/E was found to be given by $0.014+0.11/\sqrt{E}$ and $0.034+0.34/\sqrt{E}$ for electromagnetic and hadronic showers, respectively. Signal ratios of 1.2 and 1.4 were obtained for the e/h ratio of the lead-scintillator electromagnetic section and the iron-scintillator hadronic section, respectively. The calorimeter provided an accurate transverse energy trigger. The response and resolution for high-energy heavy ions were slightly better than anticipated on the basis of the low-energy calibrations. (orig.).

43252 A high precision peak sensing circuit for measuring the integral linearity of nuclear pulse amplifiers. Rogers, L.C. (Brookhaven National Lab., Upton, NY (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 279(3): 573-578 (15 Jul 1989). DOE Contract AC02-76CH00016.

This paper describes a new instrument that very accurately transforms the peak height of repetitive waveforms into a dc voltage. Used in conjunction with a precision pulse generator, this instrument provides an improved method for establishing the integral linearity of pulse amplifiers. A measured overall accuracy of 0.005% for pulses with a nominal 1.0 μs peaking time has been achieved. This method is particularly useful with very fast amplifiers in the 5-100 ns range. The results of linearity measurements on several typical amplifiers are presented. (orig.).

43253 CCD and vidicon x-ray detectors: Theory and practice. Gruner, S. M. (Department of Physics, Princeton University, Princeton, New Jersey 08544 (US)). *Review of Scientific Instruments (USA)*, 60(7): 1545-1551 (Jul 1989).

Because of their ability to handle the highest count rates expected at synchrotron sources, CCD and vidicon-based two-dimensional x-ray detectors are being configured into many beam lines. Although the CCD or vidicon sensing element determines the ultimate capabilities of these detectors, the practical usage of these detectors is also constrained by the specific configuration of the phosphor, intensifier, optical coupling, and readout modes which are used. Results are presented on the design of CCD and vidicon-based detectors for a variety of x-ray imaging problems. The versatility and limitations of a variety of detector configurations are discussed.

43254 Experimental techniques for the study of nuclear Bragg scattering in systems containing ^{57}Fe. Siddons, D. P. (Brookhaven National Laboratory, Upton, New York 11973 (US)); Hastings, J. B.; Faigel, G.; Grover, J. R.; Haustein, P. E.; Berman, L. E. *Review of Scientific Instruments (USA)*, 60(7): 1649-1654 (Jul 1989).

Resonant filtration of synchrotron radiation has been proposed as a method of obtaining x rays with extremely narrow bandwidths (or very long coherence lengths). Resonant scattering of x rays and neutrons is of general interest, and displays several phenomena, which require novel instrumentation in order to be properly observed. We describe here some of the techniques which we have developed for the specific purpose of studying dynamical diffraction by the Mössbauer resonance in ^{57}Fe.

43255 Current-to-frequency converter for electron multipliers. Carr, R. (Stanford Synchrotron Radiation Laboratory, P.O. Box 4349, bin 69, Stanford, California 94309 (US)); Yang, J. *Review of Scientific Instruments (USA)*, 60(7): 2321-2323 (Jul 1989). DOE Contract AC03-82ER13000.

We have developed a current-to-frequency converter which is designed to be used with electron multipliers whose anodes are raised to high voltages. It has three sensitivity scales: 10 fC/Hz, 100 fC/Hz, and 1 pC/Hz, with 6.7 decades of dynamic range in each scale. We show that this technique has the high signal-to-noise ratio required for use with electron detectors such as channel plate multipliers and channel electron multipliers.

43256 (AD-A–205688/5/XAB) **Use of a spectrally segmented photodiode-array spectrometer for inductively coupled plasma atomic-emission spectroscopy. Technical report.** Furuta, N.; Brushwyler, K.R.; Hieftje, G.M. Indiana Univ., Bloomington, IN (USA). Dept. of Chemistry. 10 Feb 1989. 29p. Available from NTIS, PC A03/MF A01.

The utility of a spectrally segmented photodiode array spectrometer was examined by using inductively coupled plasma atomic emission spectrometry (ICP-AES). The spectrometer used in this study is capable of high resolution (reciprocal linear dispersion of approximately 0.08 nm/mm at 300 nm) over a wide spectral range (190-145nm). The effect of using spectral-peak areas instead of peak heights as a signal definition was determined by using the emission signals from 10 molybdenum lines obtained at various photodiode-array integration periods. In addition, a signal definition involving a summation over a range of 5 pixels offered the best signal-to-noise ratio when the noise was defined as the standard deviation of the residual values from the line fit to the sideband background level. A detection limit of 6 ng/ml was determined in this way for molybdenum. The multichannel capability of the spectrometer was found to permit continuous background correction, thereby reducing errors caused by low-frequency noise or plasma drift. Detector linearity was found to extend over three orders of magnitude with a single integration period.

43257 (AD-A–205985/5/XAB) **Quantum theory of the nonlinear interferometer.** Shirasaki, M.; Haus, H.A.; Wong, D.L. Massachusetts Inst. of Tech., Cambridge, MA (USA). Research Lab. of Electronics. Jan 1989. 8p. Available from NTIS, PC A02/MF A01.

Pub. in Jnl. of the Optical Society of America B, Vol. 6, No. 1, 82-88(Jan 1989).

A full quantum theory of the Mach-Zehnder interferometer with nonlinear Kerr media in both arms is presented. The nonlinear operator equations can be integrated, and the result can be normal-ordered. This permits the evaluation of the factorial moments of the photon number to all orders of the nonlinearity. Various excitations and phase biases are studied. The degree of squeezing by the interferometer is determined.

43258 (AECL–9522) **Radiotracer techniques for measuring fluid flow and calibrating flow meters.** Cooper, E.L. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Aug 1987. 25p. Order Number DE89635596/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Radiotracer techniques can be used to measure accurately both gas and liquid flow rates under operating conditions in a wide range of flow systems. They are ideally suited for calibrating flow meters as well as for measuring unmetered flows in industrial plants. Applications of these techniques range from measuring the flows of fuels and process fluids for energy and mass balance studies to measuring the flows of liquid and airborne effluents for pollution control. This report describes the various radiotracer techniques which can be used to measure fluid flows. The range of application and inherent accuracy of each technique is discussed.

43259 (AOSTRA–8808, pp. 12) **I R analyzer for stability measurements of residual oils.** Lambert, D.C. (BP France, Lavera, France); Holder, K.A. Alberta Oil Sands Technology and Research Authority, Edmonton, AB (Canada). 1988. (CONF-880807–: 4. UNITAR/UNDP international conference on heavy crude and tar sands, 7-12 Aug 1988; CE–02658). In *UNITAR/UNDP, 4th international conference on heavy crude and tar sands, vol. 2.* Available from Alberta Oil Sands Technology and Research Authority, 500 Highfield Pl., 10010-106 St., Edmonton, AB, CAN T5J 3L8; $150.00 CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The thermal treatment of heavy oils and residues results in a reduction in the stability of the products. In visbreaking, for example, all feedstocks have a maximum conversion limit which, if exceeded, would lead to the production of an unstable oil product. A solvent precipitability model has been devised to characterize those changes that take place during processing, which can lead to asphaltene deposition. The stability of the oil is determined by two parameters. XA is a measure of the precipitability of the least soluble asphaltenes. XS measures the ability of the oil to maintain its asphaltenes in solution. A third parameter, the solvent power (SP) is derived from XA and XS. A new, automated apparatus has been developed to determine the stability of petroleum products according to this principle. The onset of flocculation is measured with a turbidimetric method, using infrared radiation and optic fibres. The apparatus can determine the flocculation parameters in less than 30 minutes and offers improved repeatability. It can be used to assess a wide range of materials, including crude oils, atmospheric and vacuum residues, fuels oils, and bitumens. It has been used successfully in refinery applications, including visbreaking, and as a research tool for residual oil upgrading. A version of this apparatus for on-line analysis is under development. 6 refs., 8 figs.

43260 (CONF-890462–1) **High-resolution imaging of semiconductor interfaces by Z-contrast STEM.** Pennycook, S.J.; Jesson, D.E.; Chisholm, M.F. Oak Ridge National Lab., TN (USA). 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 6. Oxford conference on microscopy of semiconducting materials; Oxford (UK); 10-13 Apr 1989. Order Number DE89015915/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A new technique for high-resolution electron microscopy is described using a high-angle annular detector in a STEM. The use of highly localized electron scattering gives the images strong chemical sensitivity and many of the characteristics associated with incoherent imaging; there are no contrast reversals with defocus or sample thickness, no Fresnel fringe effects at interfaces, no lateral

spreading of lattice fringes, and no contrast from within an amorphous phase. Column by column compositional sensitivity is achieved, even at interfaces, and rigid shifts are independent of thickness and defocus. 25 refs., 5 figs.

43261 (CONF-8611137–5) **A miniature fiber-optic probe for particle sizing.** Paul, P.H.; Kychakoff, G. Stanford Univ., CA (USA). Dept. of Mechanical Engineering. [1986]. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-85ER13393. From International congress on applications of lasers and electro optics; 1 Nov 1986. Order Number DE89015319/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

43262 (CPS–8702, pp. 351-354) **Compound specific detectors for field information.** Overton, E.B. (Louisiana State Univ., Baton Rouge, LA, USA); Kummerlowe, D. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada.

This paper describes a project that is developing instrumentation that can be used in field situations to identify and quantitate volatile toxic chemicals at trace levels (compound-specific analyses). Its goals include the development of portable analytical instrumentation that can produce laboratory quality analyses of volatile toxic chemicals with sensitivities in the low ppM and with short analytical response times. Further, the analytical devices must have the capability to transmit chemical data from remote field locations to a central laboratory facility for interpretation by a trained chemist, if needed. Methods employed in the instrument development project include modification of off-the-shelf analytical equipment, originally designed for in-lab applications, to meet the needs of rugged, field deployable instrumentation. Since no single analytical device is universally applicable or capable of providing compound-specific field analyses for the wide variety of toxic chemicals in common use, five different types of chemical instruments were chosen for this development project. These include: a small portable microchip high resolution gas chromatograph bench-top mass spectrometer, a Fourier Transform infrared spectrometer, a piezoelectric quartz microbalance, and small portable gas chromatographs with electron capture and photoionization detectors.

43263 (EGG–10617-5019) **Streak camera system for prompt display of laser pulses.** Baumgart, J.S.; Justice, R.; Bender, S. EG and G Energy Measurements, Inc., Los Alamos, NM (USA). Los Alamos Operations. [1989]. 23p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-88NV10617;W-7405-ENG-36. Order Number DE89015305/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

The streak camera is a useful tool for doing imaging experiments. Its high bandwidth and large information carrying capacity provide great flexibility in data recording. This paper describes a streak system used to make two-dimensional measurements on a pulsed laser system. The streak system measures beam position, full width, relative intensity, and shape on multiple pulses in a single sweep. These measurements are analyzed in real time and displayed for user feedback. 18 figs.

43264 (ENEA-RT-TIB–88-25) **Optical scanners: design and performance of the ENEA (Italy) digital imagery system.** Della Rocca, A.B.; Ferriani, S. ENEA, Casaccia (Italy). Dipt. Tecnologie Intersettorialli di Base; ENEA, Casaccia (Italy). Dipt. Reattori Veloci. Dec 1988. 54p. (In Italian). Order Number DE89761943/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

The EDI (ENEA Digital Imagery) image processing system, operating at the ENEA Casaccia (Italy) research centre, has an optical scanner for digitizing analogic images. Obviously, the A/D conversion process degrades the content of the images and restoring the digital images obtained becomes a crucial point. For this aim, it is necessary to find out the way the scanner actually works in order to know and quantify distortion sources. This report describes criteria and methods followed for measuring I/O parameters and evaluating performances of the EDI optical scanner.

43265 (INIS-mf–11474) **Safety and regulatory aspects in the utilization of radiation and radioactive material.** Abdul Majid Hasan. Atomic Energy Licensing Board, Kuala Lumpur (Malaysia). 1987. 8p. (CONF-8711314–: Seminar on the application of nuclear techniques in industry, 17 Nov 1987). Order Number DE89635598/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

The main objective of the Atomic Energy Licensing Act, 1984 is to regulate and control all activities dealing with atomic energy. For this purpose the Atomic Energy Licensing Board, (AELB) was established and responsibilities for authorizing, enforcing and establishing guidelines of activities to ensure safety for radiation workers, members of public and environment. To achieve these functions AELB will assess the proposed activities, if safe licence will be issued within its conditions. To ensure the licensee comply with the conditions of licence, a team of inspectorate will inspect its operation. AELB also provides guidelines and procedures of radiation protection to the licensee and anyone who intends to involve in utilization of atomic energy. (author).

43266 (INIS-SU–100, pp. 41-45) **Electrostatic energy analyzers on the basis of the mirrors with two-plate electrodes.** Kel'man, V.M. (AN Kazakhskoj SSR, Alma-Ata (USSR). Inst. Yadernoj Fiziki); Karetskaya, S.P.; Bejzina, L.G.; Sajchenko, N.Yu. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The corpuscular-optical properties of energy analyzers of the new type are discussed. It is shown that these analyzers of small sizes have high energy dispersion, focuse a charged particle beam in two mutually orthogonal directions without second order spherical aberrations. They are simple in design and their properties can be easily controlled using potentials on electrodes. They can be used to analyze low energy radiations. 6 refs.; 3 figs.

43267 (KIYI–88-21) **Grafic subsystem on SM EVM base.** Gavrilyuk, V.I.; Lyubarskij, V.A.; Ostapenko, B.V. AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij. 1988. 27p. (In Russian). Order Number DE89635599/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A subsystem realized on base of PDP-11 computer with raster and vector graphic devices: colour symbolic-graphic displays, screen printing and plotters is described. The software is presented by device-dependent low-level procedures of adaptive graphic packet IBM PC in PASKAL language realizing the main concepts of GKS standard for personal and technicak computers. Possibilities of graphic terminals and IBM PC store are completely realized or emulated. PASKAL language permits to use the packet in different executive systems, in RSX-11 and RT-11 in particular. 4 refs.; 4 tabs.

43268 (LA-UR–89-2547) **High speed single transient microwave spectrum analyzer.** Stokes, J.; Ogle, J.; Looney, L.; Gallegos, C.; Anaya, R.; Lilijestrand, R. Los Alamos National Lab., NM (USA). [1989]. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890836–4: 33. SPIE annual international technical symposium on optical and optoelectronic applied science and engineering, 6-11 Aug 1989). Order Number DE89015286/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Recent experiments have required the measurement of short pulse high bandwidth microwave spectra. To meet this need we built a GHz-bandwidth acousto-optic spectrum analyzer. The hardware includes a HeNe laser, collimating optics, Brag cell, steak camera, microchannel plate intensifier and film cassette. The frequency range measured was 350–2000 MHz with a dynamic range

greater than 20 dB. Pulse widths from 10 ns were measured with this system. 4 figs.

43269 (LBL–26882) **Design of grazing incidence monochromators involving unconventional gratings.** McKinney, W.R.; Palmer, C. Lawrence Berkeley Lab., CA (USA). Jan 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890142–5: Symposium on lasers and optics, 15-20 Jan 1989). Order Number DE89016341/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We review the basic aspects of second order focusing of straight and parallel grooved varied line space gratings in both converging and collimated light in a more explicit and detailed manner that we have found in the literature. The effects of the VLS correction to the location of the focal curve for grazing incidence geometries are found to be very significant. 6 refs., 6 figs.

43270 (MLM–3602-OP) **A digital imaging for quantitatively measuring tritium concentration in metallographic samples.** Ransick, M.H.; Downs, G.L. EG and G Mound Applied Technologies, Miamisburg, OH (USA). 1989. 13p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-88DP43495. (CONF-8907116–3: 22. annual international Metallographic Society meeting, 23 Jul 1989). Order Number DE89015382/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The development of the Video Intensified Microscope coupled with digital image processing techniques offers a new way to quantitatively measure tritium concentration in metallographic mounts. Beta particles from the decay of tritium strike a scintillation film placed on the sample causing photons to be generated. The photon signal emitted from the sample is digitized and stored in an array of pixels within a digitizing board. The time required for the acquisition of these images is on the order of minutes instead of the hours or days normally required for traditional photographic autoradiography techniques. By utilizing the techniques of digital image processing and analysis, tritium concentration can be statistically analyzed. Depth profiling of tritium into a material and two dimensional concentration gradients can be plotted and analyzed. These images are also saved to optical disks for later recall and comparison and archiving. 5 figs.

43271 (OH/RD–88-64-K) **A review of aluminum oxide sensors.** Singh, V.P. Ontario Hydro Research Div., Toronto, ON (Canada). 1988. 27p. (MICROLOG–89-02564). Available from Ontario Hydro Research Division, Records Clerk, Bldg. KR 107, 800 Kipling Ave., Etobicoke, ON, CAN M8Z 5S4; $N/C; MF CAN-MET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A literature review was carried out on the performance of aluminum oxide sensors for water vapor pressure (dew point) determinations. Unless adequately aged, significant drifts occur in the sensor output, the drift rate being aggravated by operation at high dew point. For Panametrics sensors, the response time when a dew point decrease occurs is significantly longer than the manufacturer's claim. Recommendations are made for storing the sensor and determining the effect of the sensor filter on the response time. 43 refs., 2 figs.

43272 (PTB-W–37, pp. 5-29) **Gas calorimeter for measuring the calorific value.** Assenmacher, H. (Ruhrgas A.G., Essen (Germany, F.R.)); Herbst, G. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Waerme. Jun 1988. (In German). (CONF-8712127–: 67. PTB-seminar on state and development of gas calorimetry and charging for heating gas, Braunschweig (Germany, F.R.), 10-11 Dec 1987). In *State and development of gas calorimetry and charging for heating gas. Proceedings.* Order Number DE89795859/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

In 1969, the West German Parliament passed a law on measurement and calibration (called the Calibration Law for short), which came into force on 01.07.1970. In paragraph I, this law states that measuring equipment for the direct or indirect determination of thermal or electrical energy or power must be calibrated (certified) if they are used in business. Calibration presupposes that the equipment is capable of being calibrated and it must comply with the approval requirements of the West German Physical/Technical Institute (PTB). (orig./HW).

43273 (PTB-W–37, pp. 31-38) **Calorimetric calibration gases.** Klinge, H. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Waerme. Jun 1988. (In German). (CONF-8712127–: 67. PTB-seminar on state and development of gas calorimetry and charging for heating gas, Braunschweig (Germany, F.R.), 10-11 Dec 1987). In *State and development of gas calorimetry and charging for heating gas. Proceedings.* Order Number DE89795859/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

Charging for natural gas is not only done according to the volume of gas used, but also according to its calorific value (thermal gas charge), which is determined by automatic gas calorimeters. There is a description of the absolute measurements of calorific value with indirect determination of the quantity of combustion gas. Data are given on the flame calorimeter used, the reaction vessel and combustion gas cylinder and on the calorific values of hydrogen and methane (tables, data from the literature, unit conversion factors). The mixture of methane/nitrogen and the mixture of methane/ethane could be recognised as calibration gases of the 2nd order for the natural gas area due to the good agreement of a ring comparison of several institutes. Only hydrogen could be considered as the calibration gas (pure gas) for the grid gas area. As its calorific value is too far from that of grid gas, a calibration mixture of hydrogen/methane/nitrogen was used. (HWJ).

43274 (PTB-W–37, pp. 39-46) **Approval test of gas calorimeters.** Niedung, W. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Waerme. Jun 1988. (In German). (CONF-8712127–: 67. PTB-seminar on state and development of gas calorimetry and charging for heating gas, Braunschweig (Germany, F.R.), 10-11 Dec 1987). In *State and development of gas calorimetry and charging for heating gas. Proceedings.* Order Number DE89795859/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

Due to technical progress and the inclusion of new types of measuring equipment, the extent of the regulations for calibration have increased to such an extent that the Calibration Order is at present being revised. However, there is no change for the approval test of automatic gas calorimeters due to the new edition of the building regulations (PTB requirements) contained in the Calibration Order. There are descriptions of the basic technical requirements such as burning samples of gas in the intended range of calorific values, linearity of heat exchangers, and positioning of the outlet thermometer. Investigations of the properties of the 'measuring device' (gas meter, heat medium, air meter, water meter, pair of measuring pipes for gas and water, converter) and the causes of varying results are then explained. Finally, data are given on tests of the parts of gas calorimeters with electronic components regarding 'electromagnetic compatibility'. The sample of a test report is shown. (HWJ).

43275 (PTB-W–37, pp. 47-63) **On determining the calorific value of gases by means of process gas chromotography.** Below, L. (Ruhrgas A.G., Essen (Germany, F.R.)); Herbst, G. Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Waerme. Jun 1988. (In German). (CONF-8712127–: 67. PTB-seminar on state and development of gas calorimetry and charging for heating gas, Braunschweig (Germany, F.R.), 10-11 Dec 1987). In *State and development of gas calorimetry and charging for heating gas. Proceedings.* Order Number DE89795859/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

While only automatic gas calorimeters are authorized for calibration in the Federal Republic of Germany for determining the calorific value of gases, in other countries the calorific value is calculated from the gas chromatography analysis of certain gas compositions. There is a report on the present technical state of process gas chromatography (PGC) and there is a comparison with calorimetry. The PGC requirements (18 points) are first stated. Automatic PGC equipment with control, evaluation, display and recording unit and a sampling system complying with these requirements was tested for

determining the calorific value. Data are given on the repeatability of the analysis of rare gases and PGC calibration (calibration gas, calibration cycle) and on the comparison of PGC and calorimeter. It was found that the calculation of the calorific value from gas analysis constitutes a useful alternative to calorimetric determination of the calorific value. (HWJ).

43276 (PTB-W–37, pp. 79-88) **Calibration gases for use in gas chromotographs as calorific value measurement equipment capable of calibration.** Karl, W. (Bundesanstalt fuer Materialforschung und -pruefung, Berlin (Germany, F.R.)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Waerme. Jun 1988. (In German). (CONF-8712127–: 67. PTB-seminar on state and development of gas calorimetry and charging for heating gas, Braunschweig (Germany, F.R.), 10-11 Dec 1987). In *State and development of gas calorimetry and charging for heating gas. Proceedings.* Order Number DE89795859/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

Similarities and differences between gas mixtures are shown, which are used as test gases or calibration gases for process gas chromatographs or measurement equipment liable for calibration. The requirements made of these calibration gases are made clear in 5 detailed points, the careful manufacture of gas mixtures is dealt with and the necessity for certification of the calibration gases is explained. One is also concerned with the manufacture of the test gases required for certification (statement of components of the mixture) and with carrying out the certification analysis (multi-part analysis with the carrier gases nitrogen and helium). (HWJ).

43277 (PTB-W–37, pp. 89-98) **Long-term sampling by means of an electronic sampler.** Homann, K. (Vereinigte Elektrizitaetswerke Westfalen AG (VEW), Bochum (Germany, F.R.)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Waerme. Jun 1988. (In German). (CONF-8712127–: 67. PTB-seminar on state and development of gas calorimetry and charging for heating gas, Braunschweig (Germany, F.R.), 10-11 Dec 1987). In *State and development of gas calorimetry and charging for heating gas. Proceedings.* Order Number DE89795859/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

In a 420 km long high pressure gas transport ring (H and L gas system), as gas quality measurement system was fitted, consisting of 8 gas samplers distributed over the whole network and a central gas chromatography station. The gas samples are taken automatically and filled into pressure vessels. There are reports on the method of operation of the sampler system (pneumatic circuit diagram) supported by a microprocessor, on the design (gas pressure controller, measurement system, sample bottle, solenoid valve control) and on the uncertainty of measurement of the calorific value for these gas samples (pressure and temperature effects, number of samples, scanning time, faults with interruption, spline interpolation, diagrams). (HWJ).

43278 (PTB-W–37, pp. 105-111) **Experience with approval test of gas chromatographs as calorific value measurement equipment.** Niedung, W. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.)). Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.). Abt. Waerme. Jun 1988. (In German). (CONF-8712127–: 67. PTB-seminar on state and development of gas calorimetry and charging for heating gas, Braunschweig (Germany, F.R.), 10-11 Dec 1987). In *State and development of gas calorimetry and charging for heating gas. Proceedings.* Order Number DE89795859/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

A survey is given on some special requirements for gas chromatographs as measurement equipment capable of being calibrated for the indirect determination of gas calorific values and their application in an approval test. Internal calibration gases (automatic adjustment of the gas chromatograph), carrier gases (purity, helium, nitrogen) and some examples from approval tests (permitted and prohibited ranges and functioning after calibration) are dealt with. These include inspection of the separation behaviour of the column and the detector function from the chromatogram (line recorder), the checking of interface free of feedback (printer, additional devices), the inspection of internal and external sealing (gas circuit, valves), calibration technique testing (suitable calibration gases, duration of validity of calibration) and permanent experiments (16 component calibration mixture). (HWJ).

43279 (SAND–88-2911C) **A comparison of real-time optical correlators for pattern recognition.** Stalker, K.T.; Molley, P.A.; Hansche, B.D. Sandia National Labs., Albuquerque, NM (USA). 1989. 15p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8904242–3: International congress on optical science and engineering, 24-28 Apr 1989). Order Number DE89016416/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Two types of optical correlators have been built to investigate real-time pattern recognition. The first employs one-dimensional devices to perform the two dimensional correlation in real time. This architecture uses an array of light emitting diodes (LED's) to input an electronically stored reference image into the processor in parallel. The input scene data is introduced into the processor one line at a time using an acousto-optic device (AOD). Multichannel time integrating correlations are performed in the row direction using the AOD and in the column direction using a charge coupled device (CCD) operating in the time delay and integrate mode. a processor has been built using this technology which correlates a 64 x 44 pixel binary reference image with a 256 x 232 input scene at video rates. The second correlator is a space integrating Fourier transform based correlator. A magneto optic-device (MOD) is used at the Fourier transform plane to rapidly change filter functions. The binary nature of the MOD device necessitates using either a binary phase or binary amplitude representation of the desired complex filter function. For this reason, several types of Binary Phase-Only Filter (BPOF) representations have been analyzed and experimentally investigated. Experimental correlation results have been obtained using both the Hartley BPOF and a newly developed class of complex binary filters, called Quad-Phase-Only Filters (QPOF). The performance of the two systems will be compared on the basis of processing speed, space bandwidth product, processor size and light efficiency. The inherent differences between incoherent and coherent processing and their implications for filter design will also be discussed. Finally, estimates of future performance will be presented. 10 refs., 8 figs., 2 tabs.

43280 (UCRL–52000-88-10, pp. 37-43) **Computational x-ray holography.** Yorkey, T.J.; Brase, J.M.; Clark, G.A. Lawrence Livermore National Lab., CA (USA). Oct 1988. In *Energy and technology review.* Order Number DE89005308/JAW. Available from NTIS, PC A03/MF A01.

Visible-light experiments and numerically simulated holograms are being used to test ideas about the performance of an x-ray microscope suitable for biological research. For simple Gabor holography, the plane-to-plane reconstruction via the Fresnel integral contains unwanted virtual-image information. The authors computationally reduce or eliminate the virtual image by taking advantage of other knowledge about the object of interest. To obtain information about depth, the Born approximation is used, which assumes a small amount of scattering, and filtered backpropagation for the reconstruction. The studies show poor longitudinal resolution with a single view and great improvement with multiview holography. These investigations begin to define expectations for the performance of an x-ray microscope suitable to examine objects of the size of cells and cell structures of living specimens. 5 references, 4 figures.

43281 **Temporal and spectral self-shifts of dark optical solitons.** Weiner, A. M. (Bellcore, 331 Newman Springs Road, Red Bank, New Jersey 07701-7040 (US)); Thurston, R. N.; Tomlinson, W. J.; Heritage, J. P.; Leaird, D. E.; Kirschner, E.; Hawkins, R. J. *Optics Letters (USA),* 14(16): 868-870 (15 Aug 1989). DOE Contract W-7405-ENG-48.

We report the discovery of temporal and spectral self-shifts of dark optical solitons propagating in single-mode fibers. These shifts become increasingly pronounced as the intensity and the fiber length are increased. We show that our data are in quantitative agreement with numerical solutions to a modified nonlinear Schrödinger equation that includes the Raman contribution to the nonlinear refractive index.

43282 Compact vacuum ultraviolet source for photoelectron spectroscopy. Tonkyn, R. G. (Chemistry Department, Brookhaven National Laboratory, Upton, New York 11973 (US)); White, M. G. *Review of Scientific Instruments (USA),* 60(7): 1245-1251 (Jul 1989). DOE Contract AC02-76CH00016.

A simple source chamber is described which enables the introduction of laser-generated, vacuum ultraviolet (VUV) radiation below 102 nm into most existing photoelectron and photoion spectrometers. A long capillary light guide provides a conductance barrier between the VUV source and experimental chambers, and also provides a small, well-collimated VUV beam at the interaction region. A platinum photodiode is found to provide a useful measure of the VUV intensity with minimal interference from the unconverted UV light. The performance and capabilities of the source are demonstrated by several applications using photoelectron spectroscopy.

43283 rf-induction plasma apparatus for generating submicron particles of metals. Barmore, W. L. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550 (US)); Hrubesh, L. W.; Keene, L. E.; Raymond, E. L. *Review of Scientific Instruments (USA),* 60(7): 1328-1333 (Jul 1989). DOE Contract W-7405-ENG-48.

A unique apparatus is described for generating submicron particles of metals over a narrow-size distribution range. Coarse particles of the metal were injected into the tail flame of an argon rf-induction plasma torch, where they were vaporized. The vapor was gas quenched, producing a metallic smoke of fine spheroidal particles. The system collection units separated the fine particles ($\sim$0.3-μm diameter) from the heavier particles ($\geq$1-μm diameter) while the material was finely dispersed and moving in the gas stream.

43284 Measurement of the Hall coefficient using van der Pauw method without magnetic field reversal. Levy, M. (Department of Physics, City College of the City University of New York, New York, New York 10031 (US)); Sarachik, M. P. *Review of Scientific Instruments (USA),* 60(7): 1342-1343 (Jul 1989).

The van der Pauw geometry has been widely used for the measurement of resistivities and Hall coefficients. Although the measurement of a Hall coefficient requires a finite magnetic field, it should be noted that van der Pauw's expression is valid only in the limit of zero field; in addition to the Hall contribution, measurements in a finite magnetic field generally include a term associated with field-induced changes in the longitudinal resistivity. Although a simple solution to this problem entails taking the difference between readings in opposite field directions, there are circumstances where this may be impractical. In this note we present a straightforward extension of the van der Pauw calculation which allows a determination of the Hall coefficient from quantities measured in one field direction only.

43285 Ultrasoft (C,N,O) x-ray fluorescence detection: Proportional counters, focusing multilayer mirrors, and scattered light systematics. Fischer, D. A. (Exxon PRT, Brookhaven National Laboratory, Upton, New York 11973 (US)); Colbert, J.; Gland, J. L. *Review of Scientific Instruments (USA),* 60(7): 1596-1602 (Jul 1989).

Ultrasoft x-ray detection is discussed as applied to the fluorescence yield near edge spectroscopy (FYNES) technique. We describe a progression of improved ultra-high vacuum compatible soft x-ray proportional counters for FYNES measurements. The importance of energy dispersive detection is discussed and examples shown. Scattered light background problems are quantified and compared for several real samples. Finally, focusing multilayer mirror collection is introduced for reducing scattered light background and improved elemental differentiation in the fluorescence signal.

43286 Operation of a normal-incidence transmission grating monochromator at ALLADIN. Tatchyn, R. (Stanford Synchrotron Radiation Laboratory, Stanford University, Stanford, California 94305 and Institute of Theoretical Science, University of Oregon, Eugene, Oregon 97403 (US)); Kallne, E.; Toor, A.; Cremer, T.; Csonka, P. *Review of Scientific Instruments (USA),* 60(7): 1579-1587 (Jul 1989). DOE Contract FG06-85ER13309;AC03-82ER13000.

A transmission grating (TrG) monochromator has been constructed and operated on the ALLADIN storage ring in Wisconsin in March–June of 1987. The x-ray source was a recently installed 30-period permanent magnet (PM) undulator with a 6.1-cm period. The monochromator configuration employed a single-bent focusing mirror between the source and the exit slit, with a gold transmission grating located between the mirror and the exit slit. The effective entrance slit was the circulating electron beam inside the ring. In this article, the performance of the monochromator in terms of its power loading capability is described.

43287 Combined microstructure x-ray optics. Barbee, T. W., Jr. (Lawrence Livermore National Laboratory, Livermore, California 94550 (US)). *Review of Scientific Instruments (USA),* 60(7): 1588-1595 (Jul 1989). DOE Contract W-7405-ENG-48.

Multilayers are man-made microstructures which *vary* n *depth* and are now of sufficient quality to be used as x-ray, soft x-ray, and extreme ultraviolet optics. Gratings are man-made *in-plane* microstructures which have been used as optic elements for most of this century. Joining of these two optical microstructures to form combined microstructure optical elements has the potential for greatly enhancing both the throughput and the resolution attainable in these spectral ranges. The characteristics of these new optic elements will be presented and compared to the experiment with emphasis on the unique properties of these combined microstructures. The results reported are general in nature and not limited to the soft x-ray or extreme ultraviolet spectral domains and also apply to neutrons.

43288 The superconducting x-ray lithography source program at Brookhaven. Williams, G. P. (National Synchrotron Light Source, Brookhaven National Laboratory, Upton, New York 11973 (US)); Heese, R. N.; Vignola, G.; Murphy, J. B.; Godel, J. B.; Hsieh, H.; Galayda, J.; Seifert, A.; Knotek, M. L. *Review of Scientific Instruments (USA),* 60(7): 1628-1629 (Jul 1989). DOE Contract AC02-76CH00016.

A compact electron storage ring with superconducting dipole magnets, is being developed at the National Synchrotron Light Source at Brookhaven. The parameters of the source have been optimized for its future use as an x-ray source for lithography. This first ring is a prototype which will be used to study the operating characteristics of machines of this type with particular attention being paid to low-energy injection and long beam lifetime.

43289 Performance of a high-energy-resolution, tender x-ray synchrotron radiation beamline. Cowan, P. L. (National Institute of Standards & Technology, Quantum Metrology Division, Gaithersburg, Maryland 20899 (US)); Brennan, S.; Jach, T.; Lindle, D. W.; Karlin, B. A. *Review of Scientific Instruments (USA),* 60(7): 1603-1607 (Jul 1989). DOE Contract AC02-76CH00016.

Beamline X-24A at the National Synchrotron Light Source was designed for optimal performance in the x-ray spectral region 500–5000 eV. This choice of energy range placed a number of constraints on the beamline design, requiring a crystal monochromator in a windowless UHV environment. Although this increased the complexity of the design, there were compelling scientific reasons for our desire to work in this range. In addition to tunability over the selected energy range, a primary goal was to obtain the highest possible energy resolution in the primary beam. We have achieved incident energy resolution significantly better than the typical core-level lifetime broadening for this energy range. This has permitted studies of processes that are not broadened by lifetimes, such as resonant scattering and back-reflection x-ray standing-wave effects. In addition to high resolution, it was designed to collect and focus as much flux as possible from the bending magnet source.

43290 Polarization analysis of magnetic x-ray scattering. Gibbs, D. (Brookhaven National Laboratory, Upton, New York 11973 (US)); Blume, M.; Harshman, D. R.; McWhan, D. B. *Review of Scientific Instruments (USA),* 60(7): 1655-1660 (Jul 1989). DOE Contract AC02-76CH00016.

In this paper we discuss polarization analysis in x-ray magnetic scattering experiments. The cross section for x-ray scattering is calculated, including magnetic terms, and three examples of magnetic structures are considered. It is shown that the contributions of the orbital- and spin-magnetization densities may be identified by analyzing the polarization of the scattered beam. We describe an

instrument for performing linear polarization analysis in x-ray scattering experiments, and summarize its application in recent studies of holmium.

43291 Coherence saturation for energetic photons (abstract). Csonka, P. L. (Institute of Theoretical Sciences, University of Oregon, Eugene, Oregon 97403-5203 (US)). *Review of Scientific Instruments (USA),* 60(7): 1992-1992 (Jul 1989).

There are two well-known methods to generate coherent x-ray photons: bound state x-ray lasers (BXL) and free electron x-ray lasers (FEXL). Both rely on induced photon emission. Because of the short lifetime of inverted states and high required energy densities for BXLs on the one hand, and strict tolerance specifications for FEXLs on the other, serious technological obstacles have yet to be overcome before a working device will be available for research purposes, particularly in the hard x-ray range. Coherence saturation is proposed here as an alternative method to generate coherent energetic photon beams. It does not make use of stimulated emission, therefore, it is not subject to the same technological and cost restrictions which have so far limited the effectiveness of BXLs and FEXLs in the short wavelength range. In fact, the method does not affect the process of photon emission at all: instead it rearranges the photon after they have been emitted, to achieve an increase in (transverse) coherence. The rearrangement is to be accomplished by dynamical optical means, i.e., by a collection of optical elements at least one of which is nonstationary. The speeds required are well within the range of present day technology. The method was devised primarily to facilitate certain interference experiments (e.g., holography) in the x-ray range. Correspondingly, its aim is to increase (first-order) transverse coherence. The special case will be discussed when only one optical element is nonstationary, and that is a rotating mirror. The transversely coherent intensity, $I_\perp$, is defined as the number of photons crossing the (transverse) coherence area per unit time. Denoting by I the total photon intensity, define the (degree of) transverse coherence as $C_\perp = I_\perp / I$.

43292 Equitemporal optics: a method to generate subpicosecond x-ray pulses (abstract). Csonka, P. L. (Institute for Theoretical Sciences, University of Oregon, Eugene, Oregon 97403-5203 (US)). *Review of Scientific Instruments (USA),* 60(7): 1993-1993 (Jul 1989).

Certain classes of experiments would benefit from the availability of x-ray pulses of shorter time duration than what can be achieved today. These include accurate measurements of frequency and those of time resolution. One way to generate short x-ray pulses, is to utilize only part of an originally longer train of photons, and discard the rest. This approach is of little help if the phenomenon under study (such as synchrotron radiation pumped x-ray lasers) requires not only short pulses, but also high instantaneous photon intensity. When the time averaged photon intensity cannot be increased, the required threshold for the instantaneous intensity could nevertheless be reached (and the time resolution improved), if the time duration of individual photon pulses could be reduced without losing significant numbers of photons in the process. The term "equitemporal optics" denotes a collection of optical elements which can bring about a photon pulse length compression of this type. We demonstrate in general that practical equitemporal optics for x rays requires at least one optical element which is nonstationary. It is also shown that an equitemporal optics can be constructed for x rays by making use of only a single rotating mirror, while all other elements are stationary, provided that at least one of the stationary elements is a reflector. Furthermore, that reflector cannot be a single continuous mirror, but must contain more than one appropriately positioned discontinuous section. The number of sections must not be less than the time compression factor, f_t, by which the original pulse length is to be reduced. Examples of appropriate reflectors are given. An equitemporal design of this type is presented which utilizes such a reflector together with a mirror rotating with a constant angular velocity. The time compression factor of this device is calculated.

43293 Properties and applications of fast rotors in dynamical optics (abstract). Csonka, P. L. (Institute of Theoretical Sciences, University of Oregon, Eugene, Oregon 97403-5203 (US)). *Review of Scientific Instruments (USA),* 60(7): 1994-1994 (Jul 1989).

The term "dynamical optics" is defined as a set of optical elements at least one of which is nonstationary as seen from the laboratory. Present technology allows the construction of fast rotating mirrors as components in dynamical optical systems. Calculations show that such systems can be used to achieve subpicosecond x-ray pulses and extremely high instantaneous intensities, and, alternatively they can be utilized to saturate the transverse coherence of x-ray beams thereby making possible to perform certain interference experiments. Some properties and additional applications of fast rotating mirrors are discussed: (1) The focusing properties of rotating mirrors can differ significantly from those of stationary reflectors, even though the mirrors are, of course, nonrelativistic. A small (diameter <1 mm) plane mirror when rotating can have a focal length f_m down to a few meters. By changing the speed of rotation, the focal length can be altered continuously from its minimum value, f_m, through infinity (when the mirror is at rest) to $-f_m$ (when it's rotation is reversed). Thus, mirrors can be constructed which can be made to both focus and defocus with continuously and accurately variable focal length. (2) Rotating mirrors will induce a frequency change $\Delta\omega$ in the reflected beam, allowing one in principle to tune across resonance lines, and also "active monochromatization" of x-rays, i.e., increasing the spectral intensity in a selected range, while decreasing it outside that range, all this without any change in the total photon beam intensity. This option is of interest when the total photon intensity cannot be increased beyond a certain limit, high resolution monochromatization is available, and large spectral density is called for in a chosen frequency range.

43294 Use of simultaneous reflections for precise absolute energy calibration of x rays. Arthur, J. (Stanford Synchrotron Radiation Laboratory, Stanford, California 94309 (US)). *Review of Scientific Instruments (USA),* 60(7): 2062-2063 (Jul 1989). DOE Contract AC03-82ER13000.

An experimental study of intensity variations in a synchrotron x-ray beam caused by the presence of simultaneous reflections in the silicon monochromator crystals has been compared with calculations based on dynamical diffraction theory in an effort to determine the practical limits to the use of such intensity variations for energy calibration. It has been found that relative misalignments of the monochromator crystals can lead to errors of approximately 0.01% (1 eV at 10 keV), but that with some care energy calibration to within 0.002% (0.2 eV at 10 keV) can be achieved in a short measurement.

43295 Double-crystal monochromator for a PF 60-period soft x-ray undulator (abstract). Ishikawa, T. (Photon Factory, National Laboratory for High Energy Physics, Japan (US)); Maezawa, H.; Nomura, M.; Ando, M. *Review of Scientific Instruments (USA),* 60(7): 2129-2129 (Jul 1989).

Since undulator light is sharply collimated itself, it can be effectively monochromatized by a perfect crystal. An x-ray double-crystal monochromator with a fixed exit has been designed and built for the use of undulator light from a 60-period undulator at Photon Factory (beamline 2A). Available Bragg angle ranges from 7° to 80°. Angle scan is made by means of a goniometer outside the vacuum chamber, with the finest step of 0.1 arcsec. Magnetic fluid is used as the vacuum seal of the feedthrough. The fixed exit beam position is kept by translating the second crystal along the two mechanical guides: one for normal and the other for parallel to the crystal surface. Adjustment of the parallelity of two crystals is made manually with flexible wires. Since a total power in the central coherent portion which is limited by a $1 \times 1\text{-mm}^2$ slit is not so much, a stable operation is possible without cooling the crystal. Currently, InSb (111) reflection is used. The diffracting planes of the first cyrstal is 1° off from the surface and the second is the symmetric reflection. At its fifth harmonics, brilliant undulator light of approximately 10^{12} photons/s mm^2 with 1-eV energy resolution is available (E=2 keV).

43296 Infrared synchrotron radiation measurements at Brookhaven. Williams, G. P. (National Synchrotron Light Source, Brookhaven National Laboratory, Upton, New York 11973 (US)); Hirschmugl, C. J.; Kneedler, E. M.; Sullivan, E. A.; Siddons, D. P.; Chabal, Y. J.; Hoffman, F.; Moeller, K. D. *Review of Scientific Instruments (USA),* 60(7): 2176-2178 (Jul 1989). DOE Contract AC02-76CH00016.

We describe the spectrometer and experimental stations on the infrared beamline (IR4) at the National Synchrotron Light Source, Brookhaven. We also report measurements of the source characteristics in the range 30–400 μm (25–350 cm^{-1}), including both flux and brightness and compare them with corresponding measurements from a 1000-K blackbody source.

43297 Performance of a tuneable secondary x-ray spectrometer. Brennan, S. (National Bureau of Standards, Quantum Metrology Division, Gaithersburg, Maryland 20899 (US)); Cowan, P. L.; Deslattes, R. D.; Henins, A.; Lindle, D. W.; Karlin, B. A. *Review of Scientific Instruments (USA),* 60(7): 2243-2246 (Jul 1989). DOE Contract AC02-76CH00016.

An efficient, high-resolution secondary x-ray spectrometer is critical to studies of x-ray-excited fluorescent x-ray emission spectra. Even with the highest available incident flux of x rays, the signal count rate can become unacceptably low when dispersed by an analyzing crystal. This problem is most serious in studies of gas targets, or at low energies where fluorescence yields are low. We have characterized the performance of a spectrometer based on the Rowland circle geometry with a variable-radius curved (Johann) analyzing crystal. A position-sensitive detector was used so that counts at a range of points on the Rowland circle corresponding to different wavelengths can be recorded in parallel. The efficiency of the spectrometer permits the observation of weak processes, such as subthreshold elastic and elastic x-ray scattering from gases. Energy resolution at low energies is sufficient to allow observations of spectral peak widths which are narrower than lifetime broadening widths. Polarization dependence of the fluorescence can also be studied.

43298 Virtual phase CCD x-ray detectors. Clarke, R. (Department of Physics, The University of Michigan, Ann Arbor, Michigan 48109 (US)); Rodricks, B.; Smither, R. *Review of Scientific Instruments (USA),* 60(7): 2280-2283 (Jul 1989). DOE Contract W-31-109-ENG-38.

A two-dimensional charge-coupled device (CCD) detector, based on the Texas Instruments "virtual phase" CCD, has been developed at the University of Michigan for synchrotron radiation applications. A series of performance tests were carried out at the LURE synchrotron facility, and the results show that the detector is ideally suited to measurements in dispersive absorption spectroscopy, high-resolution diffuse scattering, and small-angle scattering. The characteristics of the detector also show great promise for time-resolved experiments.

43299 X-ray microtomography on beamline X at SSRL. Kinney, J. H. (Lawrence Livermore National Laboratory, Livermore, California 94550 (US)); Johnson, Q. C.; Nichols, M. C.; Bonse, U.; Saroyan, R. A.; Nusshardt, R.; Pahl, R. *Review of Scientific Instruments (USA),* 60(7): 2471-2474 (Jul 1989). DOE Contract W-7405-ENG-48.

This article describes a high-resolution three-dimensional CT system which has been tested on the new wiggler beamline X-2 at the Stanford Synchrotron Radiation Laboratory. The present system is a rotate-only design which uses a virtual phase CCD array camera optically coupled to a high-resolution phosphor screen. The spatial resolution of this system is presently somewhat better than 10 μm (50 line pairs/mm at 20% contrast). This resolution is limited by the optical elements in the detector, and we are undertaking an effort to improve this resolution to 1 μm. Nevertheless, the spatial resolution offered by this design is sufficient to begin many studies of interest to materials research, such as, supported catalysts, composite materials, and crack growth and propagation.

43300 Optimization of CCD-based energy-modulated x-ray microtomography. Bonse, U. (Institute of Physics, University of Dortmund, Federal Republic of Germany (DE)); Nusshardt, R.; Busch, F.; Pahl, R.; Johnson, Q. C.; Kinney, J. H.; Saroyan, R. A.; Nichols, M. C. *Review of Scientific Instruments (USA),* 60(7): 2478-2481 (Jul 1989).

Employing asymmetric Bragg reflection at the monochromator we obtain a wide and practically parallel synchrotron-radiation beam which, when combined with the use of a CCD detector, enables us to perform chemically specific, high-speed and high-resolution tomography. We present recent results obtained with this new method. The actual resolution achieved was determined from the measured line-spread function of the complete detection system which includes the CCD, the fluorescent screen, and the lens used for optical magnification. The modulation-transfer function (MTF) calculated from the line-spread function shows that with only twofold magnification and at 3% contrast detectability about 28 line pairs per mm are resolved. Extrapolating from this result we find that with an optical magnification of 7:1 about 100 line pairs per mm should be resolved. Ways to optimize the method further are discussed.

43301 Soft-x-ray imaging with the 35 period undulator at the NSLS. Buckley, C. (NSLS, Brookhaven National Laboratory, Upton, New York 11973 (US)); Rarback, H.; Alforque, R.; Shu, D.; Ade, H.; Hellman, S.; Iskander, N.; Kirz, J.; Lindaas, S.; Mcnulty, I.; and others. *Review of Scientific Instruments (USA),* 60(7): 2444-2447 (Jul 1989). DOE Contract AC02-76CH00016.

In the summer of 1988, the National Synchrotron Light Source installed a 35 period soft-x-ray undulator. We are using this device as a radiation source for a beamline designed for soft-x-ray imaging experiments that require high brightness for practical operation. We present the design philosophy and implementation of this beamline. Preliminary characterization of the beamline and undulator indicate that the central intensity of the undulator is within a factor of 2 of design. We have measured an intensity of more than 10^{15} photons/s/0.1% BW/mrad^2 at 36 A. The monochromator has achieved its design resolving power of 2000.

43302 An improved double fluorescence detector for fluorescence EXAFS measurements. Heald, S. M. (Brookhaven National Laboratory, Upton, New York 11973 (US)). *Review of Scientific Instruments (USA),* 60(7): 2509-2510 (Jul 1989). DOE Contract AS05-80ER10742.

In many cases the fluorescence EXAFS signal is contaminated with fluorescence from nearby elements. If this fluorescence is of lower energy than the element of interest, x-ray filters are not effective. One method for dealing with this problem is the double fluorescence method described by Wong and Rao. This paper describes an improved version of this double fluorescence scheme that greatly improves its efficiency. Data are presented for a sample of 1/2% Hf in Ni_3 Al, and 1.6% CuO in NiO. When standard fluorescence is used, both signals are almost completely obscured by the $\cong$100 x larger Ni *K* fluorescence signal. With the double fluorescence detector the Hf L_3 and Cu *K*-edge signals are clearly observed, and good spectra can be obtained in about an hour.

Sponsored by DOD;DOE/ER. DOE Contract AC05-84OR21400. From American Institute of Chemical Engineer's summer national meeting; Philadelphia, PA (USA); 20-23 Aug 1989. Order Number DE89016080/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

Waste energetic material produced during the manufacture of explosives has been considered a by-product waste which must be disposed of. Methods such as open buring or open detonation pose potential environmental risks while disposal in specially designed hazardous waste incinerators is costly. No current method capitalizes on these materials' inherent energy capacity. Efforts to utilize these wastes as supplements to fuel oil are under way. Laboratory and bench scale operations verify the principle while economic analysis shows a positive advantage using this approach. Pilot scale testing is underway to develop fuel mixing/feeding procedures and to determine fuel mixture energy parameters. 9 refs., 6 figs., 2 tabs.

shock compression of condensed matter, 14-17 Aug 1989). Order Number DE89015280/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Interface velocimetry and plate push experiments of the TATB-based explosives investigated so far show the presence of nonsteady detonation; namely, the initial velocity history increases with increasing explosive charge length, a condition generally attributed to the variation of effective CJ pressure. A multistage reaction model is used to simulate these experiments. For these explosives, we find that the reaction must include a slow process stage so that the numerical results can be brought into good agreement with experimental observation. 8 refs., 7 figs.

43305 (ORNL/FTR–3333) **[Chemical explosives detection and analysis (mostly by mass spectrometry), Salford, England and Mannheim, West Germany, June 30, 1989–July 15, 1989]: Foreign trip report.** McLuckey, S.A. Oak Ridge National Lab., TN (USA). 20 Jul 1989. 17p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE89015399/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler attended the Triennial International Dynamic Mass Spectrometry Symposium in Salford, England, and presented a paper on the analysis of negative ions using an ion trap mass spectrometer. The emphasis of the meeting was on time-of-flight mass spectrometry and ion trap mass spectrometry. Both techniques are used in the ORNL explosives detection effort. Discussions outside of the meeting resulted in an idea that may lead to a breakthrough in our ion injection work with dramatic benefits to explosives detection. The traveler then attended the Third International Symposium on Analysis and Detection of Explosives in Mannheim, West Germany and presented a paper on the latest research at ORNL in explosives vapor detection.

43306 (UCRL–101025) **Protecting x-ray diagnostic film in high-explosive experiments.** Cook, C.F. III; Urquidez, E. Lawrence Livermore National Lab., CA (USA). 17 May 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890885–7: Flash radiography topical symposium, Portland, OR (USA), 15-18 Aug 1989). Order Number DE89016651/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Flash x-ray radiography is one of the most important diagnostic tools in high-explosive testing. To obtain high-quality radiographs it is necessary to protect the film pack from motion or damage, which can produce artifacts on the radiographic image. We describe a very effective method of film recovery, based on momentum transfer, that we have developed. We also use other techniques, described here, to help ensure the quality of the film image. 6 figs., 1 tab.

Availability: Document partially illegible.

A scenario-variant EMP assessment was performed for the Technical Control Facility and Microwave Terminal. Elements located at the EMP assessment considered the effects induced by EMP environments generated by high-altitude nuclear detonations. The EMP assessment identifies the critical electrical/electronic equipment predicted to be impaired by the largest signals induced within the facility by any high-altitude nuclear EMP environment.

43308 (AD-A–206093/7/XAB) **Spectral and temporal fidelity of a hard x-ray weapons effects simulation test in a high-gain ICF (inertial confinement fusion) facility. Master's thesis.** Nichols, D.F. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Mar 1989. 92p. (AFIT/GNE/ENP–89M-6). Available from NTIS, PC A05/MF A01.

The MORSE-CG Monte Carlo code was used to simulate the effects of hard X rays from a nuclear weapon. Facility will be an inertial confinement fusion facility for the testing of high-gain deuterium-tritium (DT) pellets, and will produce a pulse of hard X rays and neutrons over a very short time interval. A spherical shell for ^{6}LiH with a thickness of 60 cm was found to spread an instantaneous 10-keV X-ray pulse temporally over a period of 16 ns. The peak of the X-ray spectrum shifted down in energy from the 37.5 keV peak of the input spectrum to a final energy of 25 keV. Eighty-seven percent of the source X-ray intensity was lost to the LiH, resulting in a final fluence of 10.8 cal/sq cm and a final dose of 9.3 Mrads(Si) 250 cm from the source. Fifty percent of the X-ray dose arrived during an interval of 6 ns, giving a dose rate of 8 x 10 to the 14th power rads (Si)/sec. The only serious problem with the use of the LMF for hard X-ray simulation was the fluence of one-MeV-equivalent neutrons. The minimum fluence achieved was on the order of 10^{14} n/sq cm.

43309 (AD-A–206094/5/XAB) **Parallel Ada implementation of a multiple-model Kalman-filter tracking system: a software engineering approach. Master's thesis.** Lemanski, W.J. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Mar 1989. 120p. (AFIT/GCS/ENG–89M-2). Available from NTIS, PC A06/MF A01.

The success of the Strategic Defense Initiative depends directly on significant advances in both computer hardware and software development technologies. Parallel architectures and the Ada programming language have advantages that make them candidates for use in SDI command and control computer systems. This thesis examines those advantages in the context of an SDI-type application: implementation of a Kalman-filter tracking system. This research consists of three parts. The first is a set of software engineering guidelines developed for use in creating parallel designs suitable for implementation in Ada. These guidelines cover the design process from initial problem analysis to final detailed design. Methods of problem decomposition are discussed, as are language partitioning strategies. Justification is provided for using the Ada task construct for process boundaries, and Ada multitasking design issues are reviewed. A parallel software design methodology is also described.

43310 (AD-A–206211/5/XAB) **Radiation-response prediction of single-mode fibers. Final technical information bulletin.** Friebele, E.J. Naval Research Lab., Washington, DC (USA). Optical Sciences Div. Mar 1988. 247p. Available from NTIS, PC A11/MF A01.

Fiber-optic transmission systems, because of their extraordinary channel capacity and decreasing cost, are rapidly becoming the preferred terrestrial transmission media of the nation's long distance, inter-city telecommunications infrastructure. Since the commercial telephone network forms the foundation for emergency communication in the event of a national crisis or emergency, additional requirements are placed on the fibers and components being installed. One of the most stressing environments for the fiber consists of fallout subsequent to a nuclear attack. The susceptibility of some of types of commercially available fiber optic cable to optical darkening (and hence increased signal loss) from exposure to ionizing radiation raises serious questions about the survivability of such systems in the reconstitution phase of a nuclear conflict. There is a large body of knowledge available on the effects of gamma radiation on the older multimode fiber cables. However, there are critically important knowledge gaps with respect to the newer single-mode cables employed in the inter-city fiber-transmission links being installed today. This document is a final report of a two-year program funded by NCS at Naval Research Laboratory, which was the first systematic study of the interrelationship of fiber, fabrication parameters and radiation-induced loss. A rudimentary regression model was developed for predicting the loss induced by a fallout exposure at -35 C.

43311 (AD-A–206265/1/XAB) **Solution of two-dimensional, two-region electromagnetic ground response. Final report, March-August 1987.** Kohlberg, I. Battelle Columbus Labs., Research Triangle Park, NC (USA). Mar 1989. 42p. (BATT-TCN–87-116). Available from NTIS, PC A03/MF A01.

A solution for the two-dimensional, two-region electromagnetic ground response was developed that relates the surface components of the electric field to the surface components of the magnetic field. This has been accomplished by deriving a universal functional form for a dimensionless Green's function. The Green's function provides increasingly more accurate approximations to the response

for each successive reflection from the second layer. This result would appear to provide simplification and reduced computer running time in the numerical modelling of the HABEMP when the ground response is coupled to finite-difference methods for solving the atmospheric part of the problem.

43312 (AD-A-206355/0/XAB) **Response of layered structures to thermal-radiation pulses. Master's thesis.** Jodoin, V.J. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Mar 1989. 94p. (AFIT/GNE/ENP-89M-3). Available from NTIS, PC A05/MF A01.

An approximation to the response of composite or layered structures to thermal radiation from a nuclear device was developed. The model developed uses the Extrapolated Crank-Nicolson unconditionally stable implicit finite-difference scheme to approximate the nonlinear parabolic partial differential heat transfer equation. The model allows for convection at the front face and assumes the back face is insulated. The model assumes one-dimensional heat conduction in Cartesian coordinates. The program approximates Glasstone's thermal pulse shape and uses it and two different moments-matched pulses for the incident thermal radiation. The program was used to do a sensitivity analysis of pulse shape on response. The program uniquely handles the interface conditions to match the Crank-Nicolson accuracy and stability. The program was developed to be run for various thermal fluences and weapon yields. The results showed that the early transients are dependent on pulse shape. The temperature profile in the structure at the approximate time of blast arrival was not dependent on pulse shape however. It was also shown that the nonlinearity affected the peak temperature at the front face. Theses. (mjm)

43313 (AD-A-206549/8/XAB) **Fallout radiation effects analysis methodology. Final report.** National Communications Systems, Washington, DC (USA). 31 Mar 1988. 71p. (NCS-TIB-88-04). Available from NTIS, PC A04/MF A01.

Fallout radiation is viewed by the weapons effects community as a potentially serious impediment to maintaining or restoring critical National Security Emergency Preparedness (NSEP) telecommunication capabilities in a nuclear environment. The OMNCS' Electromagnetic Pulse Mitigation Program is designed, in part, to identify the survival probability (survivability) of the nation's NSEP telecommunications infrastructure against fallout radiation effects. The OMNCS (Office of the Manager National Communications System) is developing a balanced approach consisting of fallout radiation stress tests on the electronic piece-parts and the use of estimated performance measures of telecommunication network elements in network simulation models to predict user connectivity levels. It is concluded that, given limited available data, the proposed method can predict fallout radiation effects on network telecommunication equipment. The effects of fallout radiation are small at low dosage levels (bin 1 and bin 2). More pronounced variations in equipment performance were exhibited for radiation dosage in the 1k-5k Rads(Si) bin. Finally, the results indicate that by increasing the sample size to approximately 200 samples, the statistical quality of survivability predictions can be significantly improved.

43314 (AD-A-206714/8/XAB) **Communication facility EMP assessment. Topical report, 1 September 1975-30 March 1979.** Boeing Aerospace Co., Seattle, WA (USA). 30 Mar 1979. 67p. Available from NTIS, PC A04/MF A01.

A scenario variant EMP assessment was performed for the facility. The EMP assessment considered the equipment effects induced by EMP environments generated by high-altitude nuclear detonations. The scenario-variant technique identifies the critical electrical/electronic equipment predicted to be impaired by the largest signals induced within the facility by any high-altitude nuclear EMP environment. Electromagnetic pulse hardening is recommended to insure that all critical equipments will maintain their operational capabilities during and after an EMP illumination of the facility. Hardening design packages are provided such that, if implemented, the functional capabilities of the facility will survive the most severe high-altitude EMP.

43315 (AD-A-206715/5/XAB) **Communication facility EMP assessment. Topical report, 1 September 1975-30 March 1979.** Boeing Aerospace Co., Seattle, WA (USA). 30 Mar 1979. 67p. Available from NTIS, PC A04/MF A01.

Availability: Document partially illegible.

The Commander-in-Chief and the Defense Nuclear Agency (DNA) have undertaken an Assessment of Communications for Hardening to Electromagnetic Pulse to assess the vulnerability of the Command's Command, Control, Communications and Computer (C4) Networks to electromagnetic pulses from high-altitude nuclear bursts and to provide recommendations for hardening as may be required. Networks are used to link with the National Command Authority (NCA), subordinate and component headquarters, and the forces. The Boeing Aerospace Company has developed and validated analytical techniques to predict the functional responses of a communications facility to the electromagnetic pulse (EMP) environments produced by a high-altitude nuclear-weapon-detonation scenario. The analytical capability has been applied to selected elements of the C4 Networks to develop response predictions in terms of upset and damage of facility equipment and functional impairments of facility communications capabilities.

43316 (AD-A-206952/4/XAB) **Effects of high-altitude electromagnetic pulse (HEMP) on telecommunications assets. Final Technical Information Bulletin.** Booz, Allen and Hamilton, Inc., Bethesda, MD (USA). Jun 1988. 114p. Available from NTIS, PC A06/MF A01.

Supersedes Rept. No. NCS-TIB-87-15, AD-A196 914.

The objective of the Electromagnetic Pulse (EMP) Mitigation Program is the removal of EMP as a significant impediment to timely reestablishment of regional and national telecommunications following an attack against the United States that includes high-altitude nuclear detonations. The program approach involves estimating the effects of High-altitude EMP (HEMP) on telecommunication connectivity and traffic-handling capability, assessing the impact of available HEMP mitigation alternatives, and developing a comprehensive plan for implementating mitigation alternatives. This report summarizes available test results as they apply to the EMP Mitigation Program, and supercedes all previous versions of this report.

43317 (AD-A-206971/4/XAB) **Equipment level fallout radiation-effects approach. Final report.** Booz, Allen and Hamilton, Inc., Bethesda, MD (USA). 10 Feb 1989. 54p. Available from NTIS, PC A04/MF A01.

National Security Decision Directive (NSDD) 97 and Executive Order (EO) 12472 call for the ability to maintain National Security Emergency Preparedness (NSEP) communication capabilities in times of national disaster, which includes a nuclear attack. The Office of the Manager, National Communications System (OMNCS) sponsors the Electromagnetic Pulse (EMP) Mitigation Program to evaluate and, where possible, mitigate the effects of the nuclear attack. Fallout radiation has been identified as an environment that may effect the performance of the regional and national telecommunication system. This report presents the investigations in the network-level fallout radiation methodology used to determine the effects of this environment. Alternative techniques are presented to improve the methodology.

43318 (AD-A-955412/2/XAB) **Soviet post-attack recovery: an initial assessment. Final report, February 1976-May 1978.** Earle, M.M.; Hunter, H. SRI International, Arlington, VA (USA). Strategic Studies Center. May 1978. 44p. (SRI-W-78-17302). Available from NTIS, PC A03/MF A01.

This Technical Note examines the applicability of using an econometric model in the evaluation of the recovery potential of the Soviet Union following a nuclear war. Specific observations are made concerning the limitations of such an analytical tool in assessing intersectoral differences during recovery and improvements needed in an econometric model constructed for examining peacetime economic processes if features of recovery phenomena are to be properly treated. Contents: Basic Characteristics of this Approach to Economic Analysis of the Postattack-Recovery Process; A Brief Description of SOVMOD II; Results of Selected Tests Used in SOVMOD II; Detailed Recovery Phenomena within the Industrial Sector; Major Limitations of SOVMOD II for Recovery Analysis.

43321 (UCRL-52000-88-10, pp. 30-36) **Imaging in the nuclear test program.** Frerking, E. Lawrence Livermore National Lab., CA (USA). Oct 1988. In *Energy and technology review.* Order Number DE89005308/JAW. Available from NTIS, PC A03/MF A01.

The acquisition, processing, and display of data in the form of images has become increasingly important to the Nuclear Test Program. Using inexpensive new computer-imaging tools, every portion of the cycle of camera preparation, data collection, and data processing are performed more easily, speedily, and comprehensively than before. With these new capabilities one can perform new experiments. This increase in processing power promises to be a continuing trend that will enable the new experiments to answer old and puzzling questions about the physics of nuclear designs. 9 figures.

43322 (ACUNS-8701, pp. 17-49) **Climatic variation and change and implications for arctic heritage planning strategies.** LeDrew, E.F. Association of Canadian Universities for Northern Studies (ACUNS), Ottawa, ON (Canada). 1987. (CONF-8508276-: Arctic heritage, Banff (Canada), 24-28 Aug 1985; MICROLOG-87-03004). In *Arctic heritage. Proceedings of a symposium.* Available from Association of Canadian Universities for Northern Studies, 130 Albert Street, Ottawa, ON, CAN K1P 5G4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Arctic regions are particularly vulnerable to climatic variability and change. This has important implications for the management of natural resources and the development of man's habitation in Canadian North. As a consequence of the nature of the feedbacks between the cryosphere the atmosphere and the ocean, the climate is significantly more sensitive in the Arctic than elsewhere to any perturbations within the climatic system. Scenarios are being developed on the basis of numerical simulations of the atmosphere and the study of past climates as analogues in an effort to understand the nature of the nature of the variability or change and to give insight into the probable consequences. Essential variables involved in these feedbacks include the CO_2 and particulate loading of the atmosphere, the extent of the pack ice, deforestation of the boreal forest and the general circulation of the atmosphere and ocean. In this paper, the factors contributing to the sensitivity of the arctic climate to variability and change have been reviewed. The directions of research required to provide more confident answers to questions related to planning in the Canadian Arctic have been discussed. Of particular concern is the dearth of traditional data with sufficient temporal and spatial resolution. Hemispheric surveillance using repetitive remote sensing is necessary to examine regional scale processes. Intensive study is proposed of key ecological areas such as refugia and thermal oases as well as anomalous phenomena such as the North Water. 92 refs., 9 figs., 1 tab.

43323 (AD-A-206236/2/XAB) **SHARC (Strategic High-Altitude Radiance Code). A computer model for calculating atmospheric radiation under non-equilibrium conditions.** Sharma, R.; Ratkowski, A.J.; Sundberg, R.L.; Duff, J.W.; Bernstein, L.S. Air Force Geophysics Lab., Hanscom AFB, MA (USA). Feb 1989. 22p. (AFGL-TR-89-0083). Available from NTIS, PC A03/MF A01.

The Strategic High-Altitude Radiance Code (SHARC) is a new computer code that calculates atmospheric radiation for paths from 60 to 300 km altitude in the 2-40 micro spectral region. It models radiation due to NLTE (Non-Local Thermodynamic Equilibrium) molecular emissions which are the dominant sources at these altitudes. The initial version of SHARC, which is described in this paper, includes the five strongest IR radiators, CO_2, NO, O_3, H_2O and CO. Calculation of excited state populations is accomplished by interfacing a Monte Carlo model for radiative excitation and energy transfer with a highly flexible chemical kinetics module derived from the Sandia CHEMKIN Code. An equivalent-width, line-by-line approach for the radiation transport gives a spectral resolution of about 0.50/cm. The radiative-transport calculation includes the effects of combined Doppler-Lorentz (Voigt) line shapes. Particular emphasis was placed on modular construction and supporting data files so that models and model parameters can be modified or upgraded as additional data become available. The initial version of SHARC is now ready for distribution.

43324 (DFVLR-Mitt.-89-04) **5th user seminar of the German Remote Sensing Data Center of DFVLR. Proceedings.** Winter, R.; Markwitz, W. Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt e.V., Koeln (Germany, F.R.). Feb 1989. 116p. (In German). Order Number DE89796108/JAW. Available from NTIS (US Sales Only), PC A07/MF A01; NTIS (US Sales Only), PC A06/MF A01.

From June 6 to June 7, 1988 the 5th user seminar of the German Remote Sensing Data Center of DFVLR took place in Oberpfaffenhofen. The application potential of satellite data of NOAA-, LANDSAT- and SPOT satellites was presented in 21 papers. The main emphasis was put on the evaluation of NOAA-data for meteorological and oceanographic applications and investigations of Federal Government Agencies into planning, inventory, monitoring, statistical census and geoscientific developing aid. (orig.) With 38 figs., 4 tabs., 50 refs.

43325 (DOE/PC/79668-T4-Vol.1-Exec.Summ.) **Conceptual design of a coal-fired MHD retrofit plant (Scholz Plant - Sneads, FL): Volume 1, Final report.** Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Energy Systems Div. Apr 1989. 296p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC22-87PC79668. Order Number DE89015742/JAW. Available from NTIS, PC A13/MF A01 - OSTI; GPO Dep.

Westinghouse Advanced Energy Systems (WAES), through Contract No. AC22-87PC79668, has completed a conceptual design study to evaluate a coal-fired MHD retrofit of a utility plant of sufficient size to demonstrate the technical and future economic viability of an MHD system operating within an electric utility environment. The utility plant considered in this study is the Scholz Generating Station which is owned and operated by Gulf Power Company, a member of the Southern Company. The design team was comprised of the following members: Southern Electric International (the architectural engineering arm of the Southern Company), University of Tennessee Space Institute (UTSI), SciTec Inc., HMJ Corporation, STD Research Corporation, and Westinghouse R&D. This report, a contract deliverable, documents the efforts of this team over a period of performance from October 1987 through April 1989.

K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In recognition of the impact of climate and climatic fluctuations on society, a Canadian Climate Program was established in 1978 to integrate the efforts of various federal and provincial agencies, as well as the universities and private sector, in the field of climatology. One of the program's main components since 1984 has been research to assess and identify the potential social and economic impacts of climate warming expected under a doubled carbon dioxide scenario. These and other studies over the last several years have clearly shown that increasing greenhouse gas concentrations have the potential for profound impacts on Canada's physical environment. However, they also show that there is considerable uncertainty associated with the magnitude of the expected climate warming and with understanding the relationships between climate, the biophysical environment, and socioeconomic systems. This report summarizes the program and specific studies including those on the impact of climate change on navigation and power generation, agriculture, tourism and recreation, and the marine environment.

43327 (GKSS–89/E/7) **Framework of cloud parameterization including ice for 3-D mesoscale models.** Levkov, L.; Jacob, D.; Eppel, D.; Grassl, H. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). 1989. 50p. Order Number DE89911495/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; NTIS (US Sales Only), PC A03/MF A01.

A parameterization scheme for the simulation of ice in clouds incorporated into the hydrostatic version of the GKSS three-dimensional mesoscale model. Numerical simulations of precipitation are performed: over the Northe Sea, the Hawaiian trade wind area and in the region of the intertropical convergence zone. Not only some major features of convective structures in all three areas but also cloud-aerosol interactions have successfully been simulated. (orig.) With 19 figs., 2 tabs.

43328 (GSF–17/88) **Dispersion and effects of photooxidants in the Alpine regions. Proceedings.** Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Projektgruppe Bayern zur Erforschung der Wirkung von Umweltschadstoffen (PBWU). Jun 1988. 699p. (In German). (CONF-8804293–: International symposium on dispersion and effects of photooxidants in the Alpine regions, Garmisch-Partenkirchen (Germany, F.R.), 11-15 Apr 1988). Order Number DE89795432/JAW. Available from NTIS (US Sales Only), PC A99/MF A01; NTIS (US Sales Only), PC A99/MF A01.

This compendium of reports comprises 42 lectures held at the international meeting as well as 13 contributions in the form of posters, mainly all of which are in the German language. The significance of the photochemical oxidants as one of the main causes for damage to mountain forests is investigated. The following main topics were dealt with at the symposium: (A) survey of the damage to the forests in some Alpine countries; (B) emission of precurser substances and ozone; (C) formation, conversion and transport of photochemical oxidants; (D) immission of ozone; (E) integrating measuring methods; (F) effect on plants; (G) ecological reflections and future strategies. (RB).

43329 (INIS-mf–11991) **Numerical modeling of atmospheric washout processes.** Berichte des Zentrums fuer Umweltforschung. Bayer, D.; Beheng, K.D.; Herbert, F. Frankfurt Univ. (Germany, F.R.). Zentrum fuer Umweltforschung. Sep 1987. 82p. (In German). Order Number DE89911031/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

Also published as report no. 70 of the Institut fuer Meteorologie und Geophysik, Frankfurt Univ. (Germany, F.R.).

For the washout of particles from the atmosphere by clouds and rain one has to distinguish between processes which work in the first phase of cloud development, when condensation nuclei build up in saturated air (Nucleation Aerosol Scavenging, NAS) and those processes which work at the following cloud development. In the second case particles are taken off by cloud droplets or by falling rain drops via collision (Collision Aerosol Scavenging, CAS). The physics of both processes is described. For the CAS process a numerical model is presented. The report contains a documentation of the mathematical equations and the computer programs (FORTRAN). (KW).

43330 (Juel-Spez–492) **Impact of green on the urban atmosphere in Athens.** Scientific series of the International Bureau. Horbert, M.; Kirchgeorg, A.; Chronopoulou-Sereli, A.; Chronopoulos, J. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Internationales Buero. 1988. 187p. Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

Ten climate stations were run in the Athens area from May, 1984 to April, 1985. In addition, data from 3 stations belonging to the Greek Meterological Service were employed. Numerous temporary readings were made at another 580 locations in various weather conditions and at various times of day between April and September, 1984, using two mobile climate measuring units. These data provided the basis for area-covering maps for the parameters of temperature and vapor pressure, as well as wind distribution maps for the greater Athens area in various weather conditions on a scale of 1:10,000. The data were correlated with the location of the measuring stations in the greater area and relief, the various types of construction and area use, the amount of open spaces, as well as the type of vegetation. In so doing, it was possible to determine which factors contribute to pollution or improvement of the bioclimate situation during periods of high pressure weather conditions occuring in the summer. With the help of special small-scale readings, the climatic effectiveness of green areas, were more closely investigated. (orig./KW).

43331 (NRC–27569) **Experimental lake area atmospheric corrosion program. Report for the period December 1984 - November 1985.** Hechler, J.-J.; Boulanger, J.; Noel, D. National Research Council of Canada, Ottawa, ON (Canada). 1987. 38p. Available from National Research Council of Canada, Publication Sales and Distribution Office, Montreal Road, Ottawa, ON, CAN K1A 0R6; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Experimental Lake Area (ELA), near Kenora, Ontario was chosen in July 1984 to serve as a baseline site for an atmospheric corrosion program which is part of the US National Acidic Precipitation Program. This work is part of the Canadian Long Range Transport of Airborne Pollutants (LRTAP) research program and also one of the joint US-Canadian research project related to transboundary air pollution. This report gives the results of the first year of testing (December 1984 - November 1985). Two types of samples were exposed: 4-by-6 in. weight loss samples and 1-by-1.25 in. surface analysis samples of the following metals: mild steel, galvanized steel, galvalume, copper, aluminium and weathering steel. Two nitration and two sulfation plates were also exposed for periods of one month during the whole year. Two humidity sensors (Sereda type) were mounted on the testing rack to measure the time-of-wetness. Results show that the values obtained at ELA are lower than the least corrosive site in the USA, the New York site. A rapid glance at the air quality and precipitation chemistry also shows lower value of pollutants. Thus ELA seems to fulfil its requirements as a baseline site. 3 figs., 18 tabs.

43332 (SFB–210/ET-50) **Wind tunnel modeling of heat islands in a turbulent boundary layer.** Bloechl, B. Karlsruhe Univ. (T.H.) (Germany, F.R.). Sonderforschungsbereich 210 Stroemungsmechanische Bemessungsgrundlagen fuer Bauwerke. Jun 1988. 157p. (In German). Available from Karlsruhe Univ. (T.H.) (Germany, F.R.). Sonderforschungsbereich 210 Stroemungsmechanische Bemessungsgrundlagen fuer Bauwerke.

The basic studies of this report, had been done with a wind tunnel. Model similarity with typical atmospheric situations - such as an urban heat island - had to exist. Sufficient heat is needed to generate turbulent convection at the ground. By omitting the Boussinesq-approximation proper similarity parameters could be found to present the results in a dimensionless form. Also the effect of a cross circulation was investigated as well as the question at which conditions the convection is no longer able to overcome the longitudinal momentum of the wind. (KW).

43333 Aspects of regional-scale flows in mountainous terrain. Bossert, J. E. (Department of Atmospheric Science, Colorado

State University, Fort Collins, Colorado (US)); Sheaffer, J. D.; Reiter, E. R. *Journal of Applied Meteorology (USA)*, 28(7): 590-601 (Jul 1989).

Mountaintop data from remote stations in the central Rocky Mountains have been used to analyze terrain-induced regional (meso-β to meso-α) scale circulation patterns. The circulation consists of a diurnally oscillating wind regime, varying between daytime inflow toward, and nocturnal outflow from, the highest terrain. Both individual case days and longer terms averages reveal these circulation characteristics. The persistence and broadscale organization of nocturnal outflow at mountaintop, well removed from valley drainage processes, demonstrates that this flow is part of a distinct regime within the hierarchy of terrain-induced wind systems.

43334 Tributary fluxes into Brush Creek Valley. Coulter, R. L. (Center for Environmental Research, Biological, Environmental, and Medical Research Division, Argonne National Laboratory, Argonne, Illinois (US)); Orgill, M.; Porch, W. *Journal of Applied Meteorology (USA)*, 28(7): 555-568 (Jul 1989).

Measurements in a tributary to Brush Creek Valley during the September and October 1984 ASCOT campaign with laser anemometers, tethersondes, a minisodar, and smoke releases were used to calculate the contribution by tributaries to nocturnal drainage flow from the main valley. Four experimental nights with different mesoscale wind regimes were used in the study. It was found that a simple picture of mass flux proportional to drainage area is not sufficient to predict the relative contributions of drainage basins. The exposure of the slopes within the tributaries to the external wind regime was found to be a significant factor in the contribution of the upper regions of the tributary; but drainage from the well-protected lower region was found to irection than when the external wind was along the drainage direction. A circulation cell that introduces mass into the tributary system both from the main canyon flow and from the side opposite the main canyon flow is proposed to explain this effect.

43335 Micrometeorology of slope flows in a tributary canyon during the 1984 ASCOT experiment. Shinn, J. H. (Lawrence Livermore National Laboratory, Livermore, California (US)); Cederwall, R. T.; Gouveia, F. J.; Chapman, K. R. *Journal of Applied Meteorology (USA)*, 28(7): 569-577 (Jul 1989).

Micrometeorological data collected on towers are used to document slope flows on the sidewalls of main and tributary canyons. Six weeks of low-frequency, continuous data provide a background for comparison with data obtained during two nocturnal experiments. This comparison demonstrates the relatively strong drainage conditions during the experiments. The expected low-level wind speed maxima were observed, along with mass flux divergence down the 35° slopes. Profiles of turbulent kinetic energy, derived from high-frequency data taken during the two experiments, show a maximum near the canyon sidewalls. These features of the slope flows are disturbed occasionally on the main valley sidewall when the main valley flow impacts the sidewall; such disturbances are not observed in the tributary canyon.

43336 A numerical model study of nocturnal drainage flows with strong wind and temperature gradients. Yamada, T. (Los Alamos National Laboratory, Los Alamos, New Mexico (US)); Bunker, S. *Journal of Applied Meteorology (USA)*, 28(7): 545-554 (Jul 1989).

A second-moment turbulence-closure model described in Yamada and Bunker is used to simulate nocturnal drainage flows observed during the 1984 ASCOT field expedition in Brush Creek, Colorado. In order to simulate the observed strong wind directional shear and temperature gradients, two modifications are added to the model. The strong wind directional shear was maintained by introducing a "nudging" term in the equation of motion to guide the modeled winds in the layers above the ridge top toward the observed wind direction. The second modification was accomplished by reformulating the conservation equation for the potential temperature in such a way that only the deviation from the horizontally averaged value was prognostically computed.

43337 Tributary, valley and sidewall air flow interactions in a deep valley. Porch, W. M. (Los Alamos National Laboratory, Los Alamos, New Mexico (US)); Fritz, R. B.; Coulter, R. L.; Gudiksen, P. H. *Journal of Applied Meteorology (USA)*, 28(7): 578-589 (Jul 1989).

Field experiments measuring nocturnal tributary flows have shown complex internal structure. Variations in the flow range from short-term (8–16 min) oscillations (related to tributary/valley flow interactions) to long-term flow changes throughout the night (related to upper ridge slope and tributary sidewall cooling rate changes). The mean vertical structure in the tributary flow shows a three layer structure. Outflow winds are observed near the surface and in an elevated jet up to several hundred meters height. A flow minimum or counterflow exists at about the height of the drainage flow maximum in the main valley. Comparisons of flow volumes and variations from a single large tributary show that 5%–15% of the nocturnal flow in the main valley may be contributed through one tributary. This implies that tributaries may dominate main valley sidewall and midvalley subsidence contributions to valley drainage flows.

43338 Simulation of tracer concentration data in the Brush Creek Drainage flow using an integrated puff model. Rao, K. S. (Atmospheric Turbulence and Diffusion Division, NOAA/ARL, Oak Ridge, Tennessee (US)); Eckman, R. M.; Hosker, R. P., Jr. *Journal of Applied Meteorology (USA)*, 28(7): 609-616 (Jul 1989).

During the 1984 ASCOT field study in Brush Creek Valley, two perfluorocarbon tracers were released into the nocturnal drainage flow at two different heights. The resulting surface concentrations were sampled at 90 sites, and vertial concentration profiles at 11 sites. These detailed tracer measurements provide a valuable dataset for developing and testing models of pollutant transport and dispersion in valleys.

43339 The dispersion of atmospheric tracers in nocturnal drainage flows. Gudiksen, P. H. (Lawrence Livermore National Laboratory, Livermore, California (US)); Shearer, D. L. *Journal of Applied Meteorology (USA)*, 28(7): 602-608 (Jul 1989). DOE Contract W-7405-ENG-48.

This paper summarizes the results of a series of perfluorocarbon tracer experiments that were carried out in the Brush Creek Valley in western Colorado under the auspices of the Atmospheric Studies in Complex Terrain (ASCOT) program. The results indicate that tracers entrained within the valley's nocturnal drainage flows displayed well defined plumes that were not influenced significantly by the larger scale flows above this deep and narrow valley. Thus, the spatial distributions of the tracers were primarily governed by the structure of the drainage flows. None of the tracers released within the valley were detected in significant quantities on the adjoining meses or within the adjacent valleys prior to sunrise.

Since the turn of the century, the earth's climate has fluctuated between warming and cooling cycles. A warming cycle has been observed in the early 1900's. The rising global temperature has been attributed to CO_2 release from the burning of fossil fuels. The absorption of IR energy emitted from the earth, or greenhouse effect , brought concern that continued warming would melt polar ice caps and permanently change global climate. However, beginning in the mid-1940's, atmospheric cooling was observed. A possible contribution to the cooling trend is an increase in the numbers of relatively small aerosol particles. These particles are efficient scatters of solar radiation. An increase in the number of scattering events causes a higher albedo, thereby creating a cooler planet. McCormick and Ludwig (1967) have presented arguments to show

this relationship. Approximately forty years later, in the early 1980's, warming of the earth's climate again has been observed.

43341 (AD-A–206321/2/XAB) **RESOLVE (Research on Operations Limiting Visual extinction) project: visibility conditions and causes of visibility degradation in the Mojave Desert of California. Final report, 1983-1986.** Trijonis, J.; McGown, M.; Pitchford, M.; Blumenthal, D.; Roberts, P. Naval Weapons Center, China Lake, CA (USA). Jul 1988. 174p. (NWC-TP–6869). Executive Summary to AD-A206 321.

The Department of Defense has been conducting an extensive air-quality study called RESOLVE (Research on Operations Limiting Visual Extinction).

43343 (BCMEP–8704) **Western and Northern Canada acid deposition/LRTAP activities annual report, 1986.** British Columbia Ministry of Environment and Parks, Victoria, BC (Canada). 1987. 57p. (MICROLOG–87-06131). Available from Western and Northern Canada acid deposition/LRTAP activities, 2nd. Fl., 4999-98th Ave., Edmonton, AB, CAN T6B 2X3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A committee was established in 1980 by senior officials of Environment Canada and the environment ministries of British Columbia, Alberta, Saskatchewan, and Manitoba to coordinate monitoring, research, and other activities related to acid rain and the long-range transport of atmospheric pollutants (LRTAP). By 1982 the Northwest Territories also participated. The year's activity reported in this document shows progress in Western and Northern Canada toward a strategy for sound management of acid deposition. Priorities since 1985 have included monitoring of sulfate deposition, developing environmental standards to protect vulnerable ecosystems, developing mathematical models of LRTAP, measuring dry deposition of sulfate, monitoring surface water quality, documenting environmental impacts of acid deposition, and reviewing emissions control technologies. Research and monitoring activities are presented for each province and the federal government, for jointly managed programs, and for industry and institutional programs. Also included are tables listing annual sulfate deposition at the various monitoring stations, and a glossary of acronyms and abbreviations. 1 fig., 5 tabs.

43344 (BCMEP–8706) **Source testing code for the measurement of emissions of total reduced sulphur compounds from stationary sources.** Keshvani, K.A. British Columbia Ministry of Environment and Parks, Victoria, BC (Canada). 1987. 88p. (MICROLOG–87-04907). Available from British Columbia Ministry of Environment and Parks, Parliament Bldgs., Victoria, BC, CAN V8V 1X4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This draft code presents six standard test methods that will permit accurate and reproducible measurement of emissions of total reduced sulfur (TRS) compounds from stationary sources when data are required under the British Columbia Waste Management Act. At the present time, these methods are considered to be reliable for measuring TRS comprised of four odoriferous sulfur compounds: hydrogen sulfide, methyl mercaptan, dimethyl sulfide, and dimethyl disulfide. Details are included for determination of sampling site and traverse points, stack gas velocity and volumetric flow rate, gas composition and molecular weight, moisture content of stack gas, TRS determination using grab sampling, and TRS determination using thermal oxidation. An appendix presents calibration procedures for S-type pitot tubes, dry gas meters and orifice meters. Relevant calculation methods are given throughout. 12 refs., 13 figs., 11 tabs.

43345 (BLP–8706) **Residential combustion spillage monitoring.** Buchan, Lawton, Parent Ltd., Ottawa, ON (Canada); SRO Engineering Ltd., Montreal, PQ (Canada). 1987. vp. (CE–02713). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, CAN K1A 0P7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Sixteen homes were continuously monitored to determine the frequency and duration of combustion product spillage from the furnaces and water heaters. In the houses which did show spillage activity, event-controlled sampling was used to determine levels of air contaminants attributable to the spillage. Additional testing of the sample houses included: air tightness testing, air change rate testing and forced spillage contaminant testing. 1 ref., 2 figs., 7 tabs.

43346 (CMHC–8703) **Monitoring combustion gas spillage frequency and duration in 20 problem prone houses. Final report.** Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1987. 30p. (CE–02729). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, CAN K1A 0P7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A research project was carried out for the purpose of determining the number of combustion gas spillage events, and the total duration of spillage, in 20 houses where pressure-induced spillage was thought to be occurring. Houses were selected in 4 regions of the country, and included 15 gas heated housed and 5 oil heated. The counters mounted on gas-fired appliances relied on a thermistor to detect hot gas spillage from the dilutioon air inlets. The number of events, and total event duration, were recorded on battery-operated mechanical counters. Oil-fired detectors were similarly designed, but used conventional smoke alarms mounted above the barometric damper, instead of thermistors, for sensing spillage. The frequency and duration of spillage showed a great deal of variation from house to house. Thirteen of the houses (68%) recorded at least one spillage event over the monitoring period. Three of these 13 experienced one event only. another three houses experienced frequent long-term backdrafting episodes, with 5 top 23 min average spill durations. It is highly likely that the longer-term spills occurred as a result of chimney backdrafting. Oil-fired appliances experienced short-term spillage of 14 to 36 typical of start-up problems. Flue dampers on 4 of the houses interfered with placement of the monitors and hampered data collection and interpretation. In two of these houses, spillage was seen to be occurring on a continuous basis by the technicians installing the monitors, and yet no data on spillage was recorded. More sophisticated monitors could solve this problem and give a better record of the spillage patterns. 1 ref., 6 figs., 6 tabs.

43347 (CPS–8702, pp. 43-52) **Adaptation and application of a dense gas dispersion model Degadis.** To, N.M. (Esso Resources Canada Ltd., Calgary, AB, Canada); Fitch, M.A.; Micek, C. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A heavier than air gas (HTAG) dispersion model Degadis has been selected to be developed into an emergency response tool. The adaptation of the model to run on a personal comuputer was successful. The organization of Degadis for such a computer consists of two main programs: Dsetup and Dega. Dsetup is run interactively. The user specifies information about the environment such as wind speed, temperature, and atmospheric pressure; the modelling details such as initial gas mass; and gas composition and properties and other details of the physical description of the gas release. Dsetup formulates the user-supplied information into an input file for program Dega. Within Dega, the main program is

DEGA1 which calls up subroutines and functions to perform transient or steady state dispersion simulations. Benchmark applications of the problem, however, showed that it speed in some cases needs to be improved. Other possible improvements are recommended. With changes including improved diagnostics and graphics, this version of Degadis is expected to become an effective tool for use in emergency response situations. 4 refs., 1 tab.

43348 (CPS–8702, pp. 165-173) **Continued development of a heavy gas dispersion modelling system: COBRA III.** Alp, E. (Concord Scientific Corp., ON, Canada); Bourque, C.P.; Oliverio, M; Napier, D.H.; Matthias, C.H. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Increased use of toxic or flammable liquefied gases in recent years as a source of energy or chemical feedstock by industry has pointed to the need for developing and maintaining practical and well-tested heavy gas dispersion models for estimating hazard zones for accidental releases of these chemicals. In response to these needs, the COBRA heavy-gas spill and dispersion model has been developed. The original model was designed primarily to simulate instantaneous or constant liquefied natural gas (LNG) spills on large bodies of water for application to marine-tanker accidents. Later versions of the model extended the original model to: four chemicals, time varying spill rates, spills on land, confined spills, and simultaneous liquid and gas releases. Several further enhancements were made the most notable one being incorporation of the ability to handle liquid droplets of the spilled heavy gas liquid (HGL) within the plume. This latter enhancement is essential for modelling releases of chemicals such as chlorine ammonia and propane from pressurized containers such as storage spheres, or rail or truck tankers. This paper describes the model characteristics and presents results of predictions of the maximum hazard zones for several different release scenarios. In general, it is seen that the models allowance for liquid mist increases the size of the hazard zone and allowing liquid water to remain in the plume as opposed to dropping it out also gives larger hazard zones. Both factors have a cooling effect on the plume. These results indicate the importance of the model's ability to handle liquid droplets within the gas cloud. Some comparisons with field data are also made.

43349 (CPS–8702, pp. 115-135) **Comparison of a heavy gas release model with field data.** Sahota, H. (Ministry of the Environment, Air Quality and Meteorology, Rexdale, ON, Canada); Misra,P.K. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A simple box model for heavy gas dispersion is modified to include the effects of wind shear in the surface layer. Instead of the usual assumption that the heavy gas cloud moves instantaneously, initial acceleration of the cloud is also accounted for. The model is verified with data from Thorney Island Field Trials in Great Britain (1982-1984). The results indicate that the location of the cloud is predicted with more accuracy when the effects of wind shear and initial acceleration are accounted for. 9 refs., 9 figs.

43350 (DOE/ER/60227–5) **[Maintenance of a rural precipitation chemistry center at Whiteface Mountain]: Progress report.** State Univ. of New York, Albany, NY (USA). Atmospheric Sciences Research Center. [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER60227. Order Number DE89016622/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

All objectives on the MAP3S protocols have been met. This includes sampling, laboratory procedures, along with supporting measurements at the summit or lodge: wind velocity, pressure, temperature, relative humidity and ozone. All blind tests and audits have been successfully passed. Data obtained from chart recordings and data loggers are routinely summarized into hourly values, and archived for use as projects need them. The same personnel and facilities were available and all required operations were performed allowing Whiteface to be an active NTN precipitation monitoring site. This was a proposal, first and most importantly, to continue our participation in MAP3S; and secondly, with the small balance of time available in this research proposal, to extend our cloud chemistry effort toward a better characterization of ion deposition to a high elevation ecosystem. Of paramount importance is an accurate assessment of the flux of water and ions as functions of inputs (cloud, rain, and dry in order of importance). Two small studies have been carried out to help understand the importance of the major inputs to the mountain. 13 refs., 1 fig., 4 tabs.

43351 (DOE/ER/60372–4) **Multi-dimensional aspects of recent climate change in North America: Progress report, 15 August 1988–1 April 1989.** Kukla, G.J.; Gavin, J.E.; Karl, T.R. Columbia Univ., Palisades, NY (USA). Lamont-Doherty Geological Observatory. Apr 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER60372. Order Number DE89016462/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Our objectives are: to analyse time related changes in the properties and frequency of individual air masses over North America and to determine the degree to which the observed changes agree with the predictions of climate models testing the CO_2 impact. Climate models predict a substantial warming of the surface air temperature due to increased levels of atmospheric CO_2 and other trace gases. The effect of greenhouse gases on the longwave versus the short wave radiation is different and affects various air masses differently. Climate change results partly form the changed properties of individual air masses and partly from the changed frequency of air mass types. We are studying the changes of air mass characteristics and changed frequency over time paying particular attention to moisture dependent variables which can mask the CO_2 signal. 5 figs., 2 tabs.

43352 (DOE/ER/69010–1) **Photosynthetic acclimation to elevated CO_2: Project status report.** Cure, J.D. Duke Univ., Durham, NC (USA). Dept. of Botany. Jul 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER69010. Order Number DE89015965/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objectives of the first year of this project were to install Sunbrella Lighting Systems into Phytotron 'C' chambers; to assemble a gas exchange system for measurement of photosynthetic parameters under controlled conditions; to work out methods of sample handling and measurement of protein, chorophyll, initial and activated RuBP Carboxylase activity and active site concentration; to begin studying the effects of light intensity on the photosynthetic acclimation of a fast-growing species to elevated CO_2.

43353 (GKYA–7224DD67) **Investigation of the indoor air quality, airtightness, and air infiltration rates of a statistically random sample of 78 houses in Winnipeg.** Yuill (G.K.) and Associates Ltd., Winnipeg, MB (Canada). 1987. vp. (CE–02702). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, CAN K1A 0P7; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

An investigation of the indoor air quality, air tightness and air infiltration rates of a random sample of 78 houses in Winnipeg was conducted in the summer and fall of 1987. The objective of this projecct was to obtain results that were representative of the Winnipeg housing stock. Therefore, a three-level sampling procedure was adopted and every effort was made to obtain positive responses from homeowners of the houses selected by this procedure. Indoor air quality was determined by measuring the pollutant levels at three locations in the home. The pollutants measured were carbon dioxide, carbon monoxide, formaldehyde, radon, ozone and respirable suspended particulates. Air tightness was measured by the fan

depressurization method. Intentional openings which include chimneys, flues, intake and exhaust ports, floor drains and sumps were left open. The air exchange rate was measured using the tracer gas technique. Initial concentrations of approximately 50 parts per billion sulphur hexafluoride were established and the rate of decay was then measured over a period of one hour. this rate of decay was then used to calculate the rate of air infiltration. Indoor air quality was related to the usage of exhaust fans in the home. Each fan was described in detail and its frequency of use was recorded. The noise level of each fan was measured with a sound level meter. Noise levels at nine preferred frequencies were also measured. A homeowner survey report was used to record personal data about the occupants. Parts of the data collected in the present project have been included in two data summaries. An article about SF_6/air mixture samplers is given as an appendix to this report. 4 figs., 6 tabs.

43354 (LIS–87) **Immission measurements of chlorinated hydrocarbons. Sampling, analysis, results.** Kirschmer, P.; Gerlach, A. Landesanstalt fuer Immissionsschutz des Landes Nordrhein-Westfalen, Essen (Germany, F.R.). 1989. 31p. (In German). Order Number DE89911267/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; NTIS (US Sales Only), PC A03/MF A01.

Most halogenated hydrocarbons present in the atmosphere stem from the use of chlorinated hydrocarbons. Evidence has been found that some of these substances are of natural origin. Some halogenated hydrocarbons have an impact on atmospheric balance altering or disrupting physical and chemical processes. Informations on the presence, spatial distribution and amounts of pollution by these substances are necessary for initiating air quality protection and pollutant reduction measures. In order to obtain these informations, suitable sampling and analytical methods are essential. The North-Rhine Westphalia State Agency of Air Pollution Control and Noise Abatement (LIS) developed and applies a measurement method for determining highly volatile halogenated hydrocarbons. A description of this method is presented. For sampling, the adsorbant Tenax TA is used. Up to eight samples can be drawn automatically with the sampling unit. For the components trichloromethane ($CHCl_3$), tetrachloromethane (CCl_4), 1,1,1-trichloroethane ($C_2H_3Cl_3$), trichloroethylene (C_2HCl_3), tetrachloroethylene (C_2Cl_4) monthly and annual averages were derived from a one-year measurement programm at the station Essen-LIS. The annual averages amounted to 0.23 $\mu g/m^3$ for trichloromethane, 1.06 $\mu g/m^3$ for tetrachloromethane, 2.54 $\mu g/m^3$ for 1,1,1-trichloroethane, 1.47 $\mu g/m^3$ for trichloroethylene and 3.10 $\mu g/m^3$ for tetrachloroethylene. Thermal desorption, dependence of blank value and calibration of the analytical procedure are discussed in detail. (orig.).

43355 (OE/ARB–082-87-AQM) **Technicca! and operating manual APIOS [acid precipitation in Ontario study] deposition monitoring program. 1st revised edition.** Bardswick, W.S. Ontario Ministry of the Environment, Toronto, ON (Canada). Air Resources Branch. 1987. 201p. (MICROLOG–87-06356). Available from Ontario. Ministry of the Environment. A.P.I.O.S. Coordination Office, 40 St. Clair Avenue West, 7th Floor, Toronto, ON, CAN M4V 1M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The atmospheric deposition program in the Acidic Precipitation in Ontario Study (APIOS) is part of ongoing research to determine the quantity, acidic concentrations, and impact of acid rain and snow, as well as dry particulate matter, falling in sensitive areas and other parts of the province. The program consists of two monitoring networks, a cumulative (28 day) and an event (daily) network. This manual has been prepared to document these networks' operating procedures in order to guide personnel in carrying out their respective duties and responsibilities. The objective of these procedures is to ensure that the reported data are complete, accurate, precise, and representative. Quality control and quality assurance procedures are included. Field operations are detailed for both precipitation and air sampling in the two networks, and for preventive maintenance and calibration of equipment. Sample reception and preparation, analytical methods, data base management, and document control are also described. 13 refs., 31 figs., 8 tabs.

43356 (OME/APIOS–005) **Acid precipitation in Ontario study, annual program report, 1986/1987.** Ontario Ministry of the Environment, Toronto, ON (Canada). Acid Precipitation in Ontario Study. 1987. V (MICROLOG–87-05279). Available from Coordination Office, 40 St. Clair Avenue West, 7th Floor, Toronto, ON, CAN M4V 1M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Acidic Precipitation in Ontario Study (APIOS) was established in 1979 to investigate the causes and effects of the long-range transport of air pollutants. The program is organized into seven work groups: emissions and atmospheric processes, aquatic effects, terrestrial effects, biogeochemical effects, legal initiatives, environmental management and economics, and communications. This report summarizes the year's activities of APIOS and includes synopses of the major projects of the various work groups. An extensive listing of APIOS-related technical reports and submissions, publications, and papers is also included.

43357 (OME/APIOS–1989E) **Summary and analysis of the second progress reports by Ontario's four major sources of sulphur dioxide.** Ontario Ministry of the Environment, Toronto, ON (Canada). Acid Precipitation in Ontario Study. [1989]. 21p. (MICROLOG–87-04686). Available from Ontario. Ministry of the Environment. A.P.I.O.S. Coordination Office, 40 St. Clair Avenue West, 7th Floor, Toronto, ON, CAN M4V 1M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Four corporate sources produce about 80% of the sulfur dioxide emissions in Ontario: Inco and Falconbridge smelters in Sudbury, Algoma Steel Corporation in Wawa, and the fossil-fuel power plants of Ontario Hydro. As part of Ontario's Countdown Acid Rain Program, these sources have been required to stage reductions in their emission levels in order to help reduce acid deposition. As part of the regulations of this program, the sources must present regular progress reports. Summaries of these reports and of the government's response to them are presented. The summaries include brief descriptions of sulfur dioxide reduction methodologies employed, incluuding a improved pyrrhotite rejection and smelting operations at Inco and Falconbridge, low sulfur dioxide emissions due to low production at Algoma Steel, and research and development. Emissions of the four sources were a total of 194 kilotonnes below the 1389 kilotonnes permitted in 1986. 3 tabs.

43358 (OME/APIOS–1989F) **Summary and analysis of the second progress reports by Ontario's four major sources of sulphur dioxide.** Ontario Ministry of the Environment, Toronto, ON (Canada). Acid Precipitation in Ontario Study. [1989]. 31p. (In French). (MICROLOG–87-04711). Available from Ontario. Ministry of the Environment. A.P.I.O.S. Coordination Office, 40 St. Clair Avenue West, 7th Floor, Toronto, ON, CAN M4V 1M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

43359 (ORNL/FTR–3331) **[Forest modeling conference, Joensuu and Hyytiala, Finland, and visits to Suonenjoki and Saariselka, Finland, June 25–July 10, 1989]: Foreign trip report.** Luxmoore, R.J. Oak Ridge National Lab., TN (USA). 27 Jul 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89015371/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The traveler participated in a forest modeling conference in Finland with a presentation of modeling investigations conducted at Oak Ridge National Laboratory and with summary comments given

during the closing session. He also led a group discussion of cooperative activities sponsored by the International Union of Forestry Research Organizations. Informal visits were made to two research facilities of the Finnish Forest Research Institute. Observations from the conference and on forestry in Finland are summarized with focus on the carbon dioxide and climate change issues.

43360 (PB–89-169858/XAB) **Annular denuder sampler for phase-distributed semivolatile organic chemicals.** Coutant, R.W.; Callahan, P.J.; Chuang, J.C. Battelle Columbus Div., OH (USA). Mar 1989. 109p. Available from NTIS, PC A06/MF A01.

A compact compound annular denuder, with a removal efficiency for volatile polynuclear aromatic hydrocarbons (PAH) of at least 90% at flow rates of up to 200 L/min, was designed for use with the PS-1 sampler. Laboratory tests of this denuder showed no detectable (< 10%) removal of ambient particulate matter larger than 0.1 micrometer mean diameter at flow rates of 100-200 L/min. The vapor-collection efficiency, as measured with naphthalene, was better than 95%, and the capacity for removal of approximately 180 micrograms of naphthalene was better than 90%. The field experiments consisted of three series: (1) outdoors during the winter; (2) indoors within a laboratory; and (3) outdoors during the summer. In these experiments a denuder difference approach was followed to monitor the phase distributions of 18 PAH. The results in general are consistent with previous work and extend the overall body of information on the phase distributions of PAH and their tendencies for artifact formation as a result of volatilization during sampling. Phase distributions for PAH were shown to be well represented by the Dubrinin-Radushkevich isotherm under both summer and winter conditions.

43361 (PB–89-169874/XAB) **Construction and testing of electrochemical NO_2 PSDs.** Findlay, M.W.; Stetter, J.R.; Yue, C. Transducer Research, Inc., Naperville, IL (USA). Mar 1989. 66p. Available from NTIS, PC A04/MF A01.

The monitoring of pollutant gases at sub-ppm and low-ppb levels is of primary concern in indoor air and non-industrial locations such as the home. The trend toward more airtight homes, which began during the energy crisis of the early 1970s, has caused concern among health experts about increased levels of indoor pollutants such as the sulfur and nitrogen oxides. It is the objective of this work to develop a personal exposure monitor (PEM), which will allow real-time monitoring of low concentrations of NO_2. The work focused upon improvement of the existing electrochemical technique so that it can be used at ppb levels.

43362 (PB–89-173215/XAB) **Atmospheric processes and effects on materials. Interim report May 88-Dec 88.** Bufalini, J.J.; Edney, E.O. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Research and Exposure Assessment Lab. 1989. 22p. (EPA–600/D-89/001). Available from NTIS, PC A03/MF A01.

Effects expected from the depletion of stratospheric ozone by the presence of CFCs are summarized. The two areas considered by these two reports are materials damage and atmospheric processes. Increased UV can affect materials in the following ways: (1) corrosion of metals is expected to increase because of increased acid deposition; (2) stone deterioration is expected to increase again because of increased acid deposition; (3) dyes are expected to fade more quickly; (4) polymers are expected to breakdown more rapidly; and (5) paints will weather faster. In the area of atmospheric processes, increased UV is expected to: (1) increase photochemical reactions in cities and more ozone is expected; (2) sulfur dioxide is expected to oxidize to sulfate more quickly; and (3) gas-particle reaction rates are expected to increase.

43363 (PB–89-173223/XAB) **Historic emissions of VOC (volatile organic compounds) and NOx in the United States from 1900 to 1985. Report for June 1988-January 1989.** Gschwandtner, G.; Mobley, J.D. Pechan (E.H.) and Associates, Inc., Durham, NC (USA). 1989. 9p. Available from NTIS, PC A02/MF A01.

See also PB–88-208723.

This paper discusses historic emissions of volatile organic compounds (VOCs) and nitrogen oxides (NOx) in the U.S. from 1900 to 1985. Total VOC emissions have increased over the study period with peaks around 1930 and 1970. In 1900, transportation sources contributed 2% of the total emissions. By 1960, these sources contributed nearly 50% of the total VOC emissions. Also, the percentage contribution of industrial processes increased from about 3% in 1900 to 26% in 1960 and 39% in 1980. External fuel combustion was a major category from 1900 to 1940, but the percentage contribution has decreased since then. Similarly, the contribution by miscellaneous other sources has also decreased with time. The percentage contribution of solid-waste disposal appears to have remained nearly constant over time. NOx emissions have increased nearly steadily since 1900, while SO_2 emissions have gradually increased from 1900 to 1980 with considerable changes during certain shorter periods of time. VOCs have also increased, but the rate of increase appears to be less than that of NOx and more than SO_2, at least on the national level.

43364 (PB–89-174171/XAB) **Size-resolved real-time measurement of sulfate aerosols utilizing an aerosol concentrator.** Fitz, D. AeroVironment, Inc., Monrovia, CA (USA). Nov 1986. 22p. (AV-FR–86/597). Available from NTIS, PC A03/MF A01.

The objective of the project was to determine the feasibility of using an aerosol concentrator as a size-resolving device, the output of which would be directed to a real-time flame photometric sulfate analyzer. The size resolving ability of the concentrator was investigated by inputting a synthetic aerosol of latex beads of precisely known size and varying the operational parameters. Results indicate that the concentrator in its present form gives inadequate size-resolution as a function of rotational speed. However, operational parameters were discovered that allowed aerosol concentration invariant of particle size. Results also indicate that the instrument did not perform well as a size-selective device due to design features that may be easily remedied. So modified, the concentrator may still meet the original objectives. A concentrator could be a marketable instrument on its own for use in improving detection limits and shortening sampling time. This would be particularly useful for sampling aerosol from aircraft using filters and for real-time particulate analyzers, which are often on the borderline of being sufficiently sensitive.

43365 (PB–89-174742/XAB) **Air-monitoring survey design for toxic air pollutants. Final report.** Crowder, J.W.; DePaul, F.T.; Bowman, J.T. DePaul and Associates, Inc., Highland Park, IL (USA). Mar 1989. 150p. Available from NTIS, PC A07/MF A01.

An objective methodology for locating toxic air-pollutant sampling sites is presented. The first priority is given to determining sampling locations where maximum concentrations could be measured. Because of the high cost of ambient measurements for most toxic pollutants, emphasis is placed on identifying locations that not only have high expected concentrations, but also a statistically significant frequency of occurrence, so that there is a good potential of seeing these values with an intermittent sampling schedule. The second priority is given to locating sites whose information could aid in finding unknown or poorly quantified sources and a technique is presented for analyzing data from the network of samplers. The siting methodology and data analysis techniques are illustrated using the southeast area of Chicago.

43366 (PB–89-180483/XAB) **Assessment of national and regional acid deposition precursor emission trends. Report for October 1986-March 1987 (Final).** Wilson, J.H.; Pechan, E.H.; Graves, K. Pechan (E.H.) and Associates, Inc., Springfield, VA (USA). Mar 1989. 136p. Available from NTIS, PC A07/MF A01.

This report gives results of an analysis of national and regional acid deposition precursor emission trends, involving SOx, NOx, and VOCs. While the focus is on emissions during 1980-1985, comparisons are made (for perspective) with emission trends for 1940-1980. Study methods integrated data from the U.S. EPA's national emission trends reports, state and regional activity indicators, and plant-level data for electric utilities and copper smelters. For 1980-1985, all three pollutants showed both annual declines and increases. For a longer term, emission trends can be divided into three periods: (1) 1940 to the mid-1970s, when emissions increased in proportion to fuel use and the GNP; (2) the late 1970s to the early 1980s, the emissions control era, when Clean Air Act programs produced a downward trend for all pollutants except NOx as the economy continued growing; and (3) since 1980, when relationships between emissions and the economy, fuel use, and regulations are making it more difficult to predict emissions in future years.

43367 (PB–89-181101/XAB) **Receptor model technical series, Volume 3 (revised). CMB (Chemical Mass Balance) model user's manual (version 6.0).** Axetell, K.; Watson, J.G. PEI Associates, Inc., Durham, NC (USA). May 1987. 84p. (EPA–450/4-83/014R). Available from NTIS, PC A05/MF A01.

For system on diskette, see PB–89-181093. See also PB–83-264622, and PB–87-206496.

The Chemical Mass Balance (CMB) Model uses the chemical composition of an ambient particulate sample to estimate the relative contributions of different source categories to the measured particulate concentration. The manual describes Version 6.0 of the CMB Receptor Model. It is designed to allow persons to use the CMB Model constructively with only a few hours learning time. The manual covers primarily the mechanical aspects of running the model. The manual is intended for wide use by state and local air pollution control agency personnel in developing State Implementation Plans (SIPs) for PM(10).

43368 (PB–89-181275/XAB) **Technological progress in reducing CFC (chlorofluorocarbon) and halon emissions.** Smith, N.D.; Shapiro, P.S. Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. Apr 1989. 13p. (EPA–600/D-89/074). Available from NTIS, PC A03/MF A01.

This paper discusses EPA's development of a technological program to implement in the U.S. the Montreal Protocol on Substances that Deplete the Ozone Layer. EPA's Office of Air and Radiation (OAR) has the lead for developing the technical and economic goals of the program, and EPA's Office of Research and Development (ORD) has the lead in providing technical support to meet the goals, including both short-term projects and long-term research. EPA's strategy is to target the halon and high chlorofluorocarbon (CFC)-using industries or industry subgroups to identify opportunities to reduce CFC and halon usage and find alternatives. When such opportunities are found, cooperative industry/government groups are formed to identify and solve the problems that impede transition away from CFC and halon usage. Other groups (including academic, non-profit research institutes, other government agencies, and foreign individuals or groups) are invited to join in the effort if they have a special expertise or interest. Identifying the high-use industry sectors and subsectors is not difficult; however, identifying appropriate industries, individuals, and groups who are willing to influence industry usage of CFCs is not easy.

43369 (PB–89-181291/XAB) **Area sources of VOC (volatile organic compounds) emissions and their contribution to tropospheric ozone concentrations. Report for July 1988-March 1989.** Environmental Protection Agency, Research Triangle Park, NC (USA). Air and Energy Engineering Research Lab. 1989. 19p. (EPA–600/D-89/075). Available from NTIS, PC A03/MF A01.

The paper quantifies the importance of area sources to total volatile organic compound (VOC) emissions, reviews components of EPA/AEERL's non-attainment program, discusses the status of emission control or prevention for several area sources, and reviews some of the regulatory strategies being implemented or considered by state and local air pollution agencies. In 1988, several projects were undertaken by AEERL to develop a greater understanding of the contribution to the ozone problem by area sources of VOCs. These include studies related to specific sources of VOCs, identification of consumer/commercial product control options, and determination of the regional/seasonal variations in emissions. In each study, available sources of information have been used to develop priorities for the sources of emissions contributing to the ozone non-attainment problem. Sources of data include the technical literature, contacts in industry and elsewhere in the EPA, and surveys conducted by various trade organizations.

43370 (PB–89-181341/XAB) **Sampling of reactive atmospheric species by transition-flow reactor: application to nitrogen species (journal version).** Ellestad, T.G.; Knapp, K.T. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab. 1988. 9p. (EPA–600/J-88/217). Available from NTIS, PC A02/MF A01.

Pub. in Atmospheric Environment, Vol. 22, No. 8, 1595-1600(1988).

Concentrations of nitric acid vapor and fine particulate nitrate were measured at the 1985 Nitrogen Species Methods Comparison Study at Claremont, California with a transition-flow reactor, which separates the gases and particles by differential diffusion in a transition-flow stream and avoids sampling artifacts for these reactive species.

43371 (PB–89-181374/XAB) **Supplement to the 1986 EPA (Environmental Protection Agency) air-quality criteria for lead - Volume 1, addendum (pages A1-A67). Draft report.** Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Criteria and Assessment Office. Mar 1989. 87p. (EPA–600/8-89/049A). Available from NTIS, PC A05/MF A01.

See also PB–87-142386.

The 1986 U.S. EPA document Air Quality Criteria for Lead (EPA-600/8-83/028 aF-dF) evaluated in detail the latest scientific information concerning sources, routes, and levels of lead (Pb) exposure and associated health effects and potential risks. An Addendum (1986) to that document focuses on additional, newer studies concerning the effects of lead on cardiovascular function and on early physical and neurobehavioral development. The present Supplement to the above materials evaluates further still newer information emerging in the published literature concerning (1) lead effects on blood pressure and other cardiovascular endpoints and (2) the effects of lead exposure during pregnancy or early postnatally on birth outcomes and/or the neonatal physical and neuropsychological development of affected children. The evaluations contained in the Supplement and the 1986 Criteria Document and Addendum are to serve as scientific inputs to decisionmaking with regard to review and revision, as appropriate, of the National Ambient Air Quality Standards (NAAQS) for Lead.

43372 (PB–89-181424/XAB) **User's guide to the Complex-Terrain Dispersion Model Plus Algorithms for Unstable Situations (CTDMPLUS): Volume 1. Model description and user instructions.** Perry, S.G.; Burns, D.J.; Adams, L.H.; Paine, R.J.; Strimaitis, D.G. Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Research and Exposure Assessment Lab. Mar 1989. 211p. Available from NTIS, PC A10/MF A01.

The Complex Terrain Dispersion Model Plus Algorithms for Unstable Situations (CTDMPLUS) is a refined air-quality model for use in all stability conditions for complex-terrain applications. It contains the technology of the original Complex Terrain Dispersion Model (CTDM) for stable and neutral conditions, but also models daytime, unstable conditions. The model makes use of considerable detail in the terrain and meteorological data (as compared to current EPA regulatory models) and requires the parameterization of individual terrain features, thus considering the three-dimensional nature of the interaction of the plume and terrain. The user's manual describes, in detail, the basis of the model and instructions for its use.

43373 (PB–89-181440/XAB) **Health-hazard evaluation determination report No. 77-37-413, Gates Rubber Company, Denver, Colorado.** Gunter, B.J. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1977. 12p. (HHE–77-037-413). Available from NTIS, PC A03/MF A01.

Personal air-sampling and employee interviews were conducted on February 9, 1977 and March 1, 1977 to evaluate worker exposures to zinc oxide, resorcinol, formaldehyde, sodium hydroxide, and ammonia during the manufacture of high pressure hose at the Gates Rubber Company in Denver, Colorado. One of ten sodium hydroxide samples exceeded the threshold limit value of 2 milligrams per cubic meter. Zinc oxide, formaldehyde, ammonia and resorcinol samples were all below evaluation criteria. The author concludes that a health hazard existed from a combination of low exposures to zinc oxide, resorcinol, formaldehyde, ammonia and rayon fibers as well as from exposure to sodium hydroxide. The author recommends that ventilation be installed in the braided hose department, that employees be provided with barrier creams for protection, and that physicians treating the employees be informed of worker exposures and work conditions.

43374 (PB–89-181457/XAB) **Health-hazard evaluation determination report No. 76-31-338, Becton-Dickinson, Division of Becton-Dickinson and Company, Juncos, Puerto Rico.** Rivera, R.; Harrington, M. National Inst. for Occupational Safety and Health,

Cincinnati, OH (USA). Oct 1976. 19p. (HHE–76-031-338). Available from NTIS, PC A03/MF A01.

Environmental and medical surveys were conducted on February 18-20, 1976 to investigate reports of mercury poisoning in workers at the Becton-Dickinson Thermometer Factory in Juncos, Puerto Rico. Breathing-zone mercury concentrations ranged up to 0.419 milligrams per cubic meter (mg/CuM), exceeding the OSHA standard of 0.l mg/CuM. Mercury concentrations in blood samples ranged from 4.0 to 39.9 nanograms per milliliter (ng/ml), and exceeded the maximum allowable concentration (MAC) of 35 ng/ml in one case. Mercury concentrations in the urine samples ranged from 10 to 120 ng/ml, which were below the equivalent MAC of 150 ng/ml. Eight cases of clinical mercurialism were diagnosed. The authors conclude that production workers are exposed to potentially toxic concentrations of mercury vapor. They recommend that work stations be vacuumed more frequently, that the company's surveillance procedures be reappraised, that protective clothing be provided and changed daily, that instructional programs be intensified to enhance employee awareness of the hazards of working with mercury, and that any exposure to mercury be minimized in women of reproductive age.

43375 (PB–89-181465/XAB) **Health-hazard evaluation determination report No. 75-150-378, Reinell Boats, Inc., Poplar Bluff, Missouri.** Rosensteel, R.E.; Meyer, C.R. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Apr 1977. 55p. (HHE–75-150-378). Available from NTIS, PC A04/MF A01.

A health-hazard investigation consisting of a combined environmental-medical study encompassing an initial survey and two follow-up evaluations was conducted at the Reinell Boats Plant, Poplar Bluff, Missouri, a facility engaged in the manufacture of fiberglass boats, between November 1975 and April 1976. Workers were evaluated through questionnaires and physical examination. Environmental assessment was accomplished by measuring airborne exposures to organic vapors, methylene bisphenyl isocyanate, and compounds containing cobalt; observing work practices; and evaluating spray-booth ventilation. In the lamination areas, the workers were primarily exposed to styrene, with less significant exposure to acetone and methylene chloride. A toxic exposure to workers was identified in the lamination areas, manifested by a marked increase of upper respiratory irritation symptoms. There was also evidence of dermatitis related to direct contact with solvents in lamination workers. Recommendations are made for medical and environmental control of conditions at this plant.

43376 (PB–89-181473/XAB) **Health-hazard evaluation determination report No. 75-11-403, Port of Duluth-Superior Grain Elevators, Duluth, Minnesota and Superior, Wisconsin.** Flesch, J.P.; Thoburn, T.W. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jun 1977. 48p. (HHE–75-011-403). Available from NTIS, PC A03/MF A01.

A health hazard investigation was conducted by NIOSH at the grain elevators in the Port of Duluth-Superior in 1975-1976. Elevator breathing-zone exposures to chemical fumigants were nearly nonexistent; only traces of carbon tetrachloride were detected at five of the elevators surveyed. Some elevator workers were exposed to airborne total grain dust at levels exceeding the OSHA nuisance dust standards. Symptoms of eye irritation were reported by a few workers presumably due to excessive dust exposures during the survey. Extensive medical evaluation of the 307 exposed workers led to the conclusion that the working environment in the grain elevators has caused acute respiratory, eye, and nasal symptoms as determined by history from workers and personal observation. A high frequency of skin reactivity to intradermal injection of insect and flax antigen was found among workers; significant correlation with wheezing upon exposure to grain dust and respiratory function abnormalities were also found. Recommendations are made to provide for worker protection, surveillance, and health maintenance.

43377 (PB–89-181507/XAB) **Health-hazard evaluation determination report No. 77-15-421, Leeds and Northrup Corporation Expendable Devices Division, Ellwood City, Pennsylvania.** Kominsky, J.R.; Stroman, R.E. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Sep 1977. 27p. (HHE–77-015-421). Available from NTIS, PC A03/MF A01.

A health hazard evaluation was conducted on December 13-15 at the Leeds & Northrup Corporation, Expendable Devices Division, Ellwood City, Pennsylvania, a facility engaged in the manufacture of carbon analysis and temperature determination devices. The airborne concentrations of formaldehyde (50000) and ammonia (7429905) were low enough to prevent respiratory injury but not the subjective upper eye and respiratory irritation reported by some of the workers. Workers involved in cement mixing presented dermatitis which could be minimized by use of protective equipment and other measures. The operator of a large mixer was exposed to potentially toxic levels of respirable crystalline silica (7631869). Recommendations are made for measures that can help minimize dermal and respiratory effects apparent to the manufacturing processes evaluated.

43378 (PB–89-181515/XAB) **Health-hazard evaluation determination report No. 77-68-417, the Washington Post Company, Washington, DC.** Moseley, C.L. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1977. 16p. (HHE–77-068-417). Available from NTIS, PC A03/MF A01.

Environmental and medical surveys were conducted on April 25 and 26, 1977 to evaluate employee exposures to burning oil at the Washington Post Company (SIC-2711) in Washington, D.C. Environmental samples of lead, tin, antimony, oil mist, and associated vapors indicated that worker exposures were not in excess of the recommended criteria. Some workers experienced irritation when exposed to smoke and vapors generated by the casting operation. The author concludes that the physiological stresses reported by the subject workers may be due to individual susceptibility. The author recommends that the workers experiencing discomfort leave the room during periods of greater contaminant generation, that the pedestal fan be moved to a more effective position, that all persons assisting in or observing the operation of shop equipment wear protective shields or glasses, that a safer practice be adopted for cleaning lead residues, and that the casting room be isolated from the rest of the work area.

43379 (PB–89-181788/XAB) **Cloud and precipitation scavenging process in the South Coast Air Basin. Final report.** Hegg, D.A.; Hobbs, P.V. Washington Univ., Seattle, WA (USA). Dept. of Atmospheric Sciences. 8 Nov 1988. 149p. Available from NTIS, PC A07/MF A01.

This report presents the results of airborne aerometric measurements of particles and trace gases during the Southern California Air Quality Study (SCAQS). Nine flights were made on six of the SCAQS study days during June and July 1987. Samples were collected at four sites per flight for measurement of sulfur dioxide, nitric acid, PAN, ammonia, fine particle (ionic species, metals, and elemental and organic carbon), carbonyl, and non-methane hydrocarbon concentrations. Analysis of the samples were performed by other SCAQS contractors. In addition, ancillary meteorological, and continuous ozone, nitrous oxide, nitrogen dioxide, sulfur dioxide, and light scattering measurements were obtained. Cloud samples were also collected when present. Measured atmospheric particle-size distributions are also presented.

43380 (PB–89-182067/XAB) **Health-hazard evaluation determination report No. 77-22-409, Purex Corporation, London, Ohio.** Gilles, D.; Meyer, C. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1977. 19p. (HHE–77-022-409). Available from NTIS, PC A03/MF A01.

See also PB–88-224274.

Environmental and medical surveys were conducted on December 8, 1976 and February 14-15, 1977 to evaluate employee exposure to soap dust from soap-impregnated steel wool pads at the Purex Corporation in London, Ohio. All respirable-dust samples were below the ACGIH standard for nuisance dust of 5 milligrams per cubic meter (mg/CuM). Three of the 75 total soap-dust concentrations exceeded the ACGIH standard of 10 mg/CuM for total nuisance dust. The soap dust, when added to pH 7 water, raised the solution pH to 10.5, which was moderately to severely alkaline. Some of the workers had abnormal pulmonary function-test results. Due to the presence of pulmonary function changes among some exposed workers, the high incidence of upper respiratory symptomatology and the high alkalinity of the soap dust, this dust should be categorized as more than a nuisance dust. Recommendations

are: the exposure limits be reduced; the ventilation system be expanded and operated at all times; employees be provided with appropriate respirators and instructions on their proper use; proper work procedures and handling methods be presented to all employees; a vacuum system be used for cleanup; and a medical-surveillance program be instituted.

43381 (PB–89-182729/XAB) **Acid deposition in Maryland: summary of results through 1988. Annual report.** Maryland Power Plant Research Program, Annapolis, MD (USA). Jan 1989. 166p. (PPRP/AD–89-1). Available from NTIS, PC A08/MF A01.

See also PB–88-157805.

The Chesapeake Bay Research and Monitoring Program coordinates Maryland's acid-deposition research and reports research results annually. This report evaluates several major topic areas including transport and chemistry of acid deposition its potential impacts on the State's streams and fish, possible impacts on terrestrial resources such as crops and forests and on materials, the ability of energy conservation programs to reduce emissions of acid-forming pollutants, and mitigation techniques for neutralizing acid waters.

43382 (PB–89-184584/XAB) **Glossary of terms related to health, exposure, and risk assessment.** Environmental Protection Agency, Research Triangle Park, NC (USA). Air Risk Information Support Center. Mar 1989. 43p. (EPA–450/3-88/016). Available from NTIS, PC A03/MF A01.

Also available from Supt. of Docs.

Many state and local agencies are developing or implementing programs to control emissions of toxic air pollutants. To successfully carry out these programs, agency personnel must be familiar with a wide range of issues and terms related to health, exposure, and risk assessment for toxic air pollutants. Understanding these issues and terms is not always an easy task. This glossary was prepared by the U.S. EPA's Air Risk Information Support Center (Air RISC) as a resource tool for State and local air pollution control agencies and U.S. EPA Regional Offices. The purpose of the glossary is to define terms that are commonly used in health, exposure, and risk assessments for toxic air pollutants.

43383 (PB–89-184709/XAB) **National air-pollutant emission estimates, 1940-1987. Final report.** Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards. Mar 1989. 83p. (EPA–450/4-88/022). Available from NTIS, PC A05/MF A01.

See also PB–88-169388.

This report presents estimates of trends in nationwide air-pollutant emissions for six major pollutants: sulfur oxides, particulate matter with PM/TSP as the indicator pollutant, carbon monoxide, reactive volatile organic compounds, nitrogen oxides, and lead. Estimates are provided for major categories of air-pollution sources. A short analysis of emission trends is given, along with a discussion of methods used to develop the data.

43384 (PB–89-186605/XAB) **Industrial-hygiene survey report of Delta Air Lines, Inc. Technical Operations Center, Hartsfield Atlanta International Airport.** Piacitelli, G.; Krishnan, R. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). 18 Jan 1989. 23p. (IWS–134.20.12). Available from NTIS, PC A03/MF A01.

A visit was made to the technical operations center of Delta Air Lines, Atlanta, Georgia to evaluate worker exposure, personal protective equipment and engineering controls in work areas where ethylene glycol ethers were used. At this facility the potential for inhalation and dermal exposure to the ethers exists primarily in the hangers during spray coating of the aircraft, small parts and ground support equipment. Approximately 20 male workers were potentially exposed directly during painting operations; approximately 50 to 60 workers working in adjacent areas may have been indirectly exposed. Concentrations of 2-ethoxyethyl-acetate (2-EEA) ranged from 0.29 to 2.77 parts per million (ppm); the OSHA permissible exposure limit was 100 ppm, and the NIOSH recommended exposure limit was the lowest feasible level. The actual inhaled dose would be much lower as a result of the use of personal protective equipment during painting operations. A potential for exposure to 2-EEA was also noted during the mixing of the paints and after the painting was completed. Protective equipment was not normally used at these times. The authors recommend specific efforts to minimize exposures.

43385 (PB–89-186662/XAB) **Industrial-hygiene survey report of Pan American Tannery, Gloverville, New York.** Fajen, J.M.; Calvert, G. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jan 1989. 37p. (IWS–076.13). Available from NTIS, PC A03/MF A01.

As part of a larger study concerning the clustering of testicular cancer among finish-department employees in tanneries, a visit was made to the Pan American Tannery, Gloverville, New York. Area air samples were taken for dimethylformamide, glycol ethers, and substances in the general air. Bulk samples were also obtained to determine the potential for exposure to heavy metals. Major components in the air samples were identified as butyl-cellosolve, diisobutylketone, limonene, and 2-ethylhexyl-acetate. Dimethylformamide was not found in the air and was no longer used in the facility. Lead was found in concentrations as high as 22,400 parts per million in a bulk scraping from a ventilation duct. The high concentrations of lead result from lead based pigments. There were three cases of testicular cancer in finishing department employees, representing a crude standardized incidence ratio of 40.5. Area air samples indicate that exposure to glycol ethers did not exceed the Federal recommended limits. The authors recommend that an ongoing testicular cancer surveillance program be provided for past and present male employees in the finishing department. Improvements should be made in the personal protective equipment offered to the workers and strict controls be instituted regarding lead exposures.

43386 (PB–89-186670/XAB) **Health-hazard evaluation report HETA-88-335-1940, Fort Stanwix National Monument, Rome, New York.** McManus, K.P. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Dec 1988. 10p. (HETA–88-335-1940). Available from NTIS, PC A02/MF A01.

See also PB–85-101343.

In response to a request from the National Park Service, an evaluation was made of possible hazardous conditions at Fort Stanwix National Monument, Rome, New York. Employee complaints had been received concerning odors and ventilation-system malfunctions. The facility was a replica of a Civil War era log building; the ductwork and air handlers for the ventilation system were located underground in a tunnel system. Indoor air quality was monitored. Dew point measurements indicated that for all areas it was between 55 and 60 deg F. Temperatures ranged from 71 to 75 deg F and humidity between 60 and 65%. Measurements of carbon dioxide registered 400 parts per million in the office and visitor center, indicating a sufficient fresh air supply to these areas. The design of the ventilation system allowed make up air to be drawn from the tunnel area. The author concludes that indoor air quality was acceptable according to evaluation criteria. The author recommends that the fresh air, which may be ducted directly to the outside air; this may eliminate complaints of musty odors.

43387 (PB–89-186688/XAB) **Health-hazard evaluation report HETA-88-311-0000, Office of Disability Determination, The Howard Building, Tampa, Florida.** Roper, P.; Lushniak, B. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jan 1989. 17p. (HETA–88-311-0000). Available from NTIS, PC A03/MF A01.

In response to a request from the Area Manager of the Office of Disability Determination, an evaluation was made of possible hazardous working conditions at the Howard Building, Tampa, Florida. Particular concern was voiced with regard to eye irritation, headaches, and fatigue with a possible connection to water leakage into the offices and pigeon nesting areas above suspended ceilings. Studies indicated no carbon-monoxide, nitrogen-dioxide, or formaldehyde concentration in the building. Carbon dioxide levels of 1000 parts per million or above were recorded which were indicative of inadequate air exchange between a building and the outdoors. An area was found along the south wall of the building with gross contamination by bird droppings and other debris. Rainwater leakage above the areas where the birds had nested washed the excrement and debris down over the office walls. As much as 2 inches of bird droppings were found on some suspended tiles. The crawl space above the first floor was observed to have health and safety hazards. Some of the symptoms were likely allergic rhinitis

while others may have resulted from a lack of fresh outdoor air. Specific measures should be taken to safely remove the bird debris, prevent additional bird inhabitation, improve drainage of condensate water, and provide an outdoor air-supply system.

43388 (PB–89-186696/XAB) **Health-hazard evaluation report HETA-88-287-1942, Saint Mary-Corwin Hospital, Pueblo, Colorado.** Gunter, B.; Daniels, W. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Dec 1988. 24p. (HETA–88-287-1942). Available from NTIS, PC A03/MF A01.

In response to a request from Saint Mary-Corwin Hospital Pueblo, Colorado, an evaluation was made of possible hazardous working conditions. Concern centered around waste anesthetic gases and vapors in the main operating rooms, exposure to ethylene oxide (EtO) from a gas sterilizer, and exposure to solvents used in the laboratory. Personal breathing zone samples were analyzed for nitrous-oxide (N_2O), halogenated anesthetic agents, xylene (1330207), EtO, acetone, and benzene. The authors conclude that there were no exposures above the environmental criteria during the survey. The authors recommend specific measures including control procedures, work practices, and work procedures that would reduce employee exposures in the operation rooms.

43389 (PB–89-187165/XAB) **Derivation of formic acid data from FT-IR spectra recorded during the 1986 carbonaceous species methods comparison study. Final report.** Tuazon, E.C. California Univ., Riverside, CA (USA). Statewide Air Pollution Research Center. Feb 1989. 20p. Available from NTIS, PC A03/MF A01.

Formic acid (HCOOH) concentrations were derived from long-path FT-IR spectra which were recorded during the Carbonaceous Species Methods Comparison Study held in Glendora, CA, August 12-21, 1986. Both the detailed instantaneous and the hourly average HCOOH values are presented here. HCOOH concentrations during the study were in the range 1-11 parts per billion (ppb). The detection sensitivity was 1 ppb and the measurement errors were within + or - 1.5 ppb. During the first 5-6 days of the study, the HCOOH concentration profiles were generally coincident with photochemical activity. During the remaining days, HCOOH levels were found to be highest in the very early morning hours, presumably as a result of build-up from as yet undetermined primary sources.

43390 (PB–89-187959/XAB) **Construction and testing of a vapor sensor based on ion mobility and gas flow.** Smith, J.P. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Nov 1988. 37p. Available from NTIS, PC A03/MF A01.

In order to answer the need for low-cost gas monitors for use in gas detection applications, a prototype sensor was built on the principle of ion mobility, and the performance of this prototype was evaluated. Ion mobility employed the difference in drift velocity in an electric field of ions formed from different substances. Due to its sensitivity, ion mobility has been used for the monitoring of a number of kinds of pollutants in air for a number of years. The technique was simple as separation of different ions depended on the difference in their drift velocities in air at atmospheric pressure. The ions were measured from the substance of interest at a narrow collector after they had traveled in a vertical direction under the influence of an electric field and in a perpendicular direction using air flow. It was anticipated that ions of different mobilities could be separated in this manner. The sensor functioned as predicted in a qualitative sense. At a given flow rate, response from the device was obtained over a given range of voltages, determined by the flow rate used. The device was very sensitive to flow parameters.

43391 (PB–89-187991/XAB) **Health-hazard evaluation report mHETAs-87-110-1943, Columbia Farms Poultry Plant, Columbia, South Carolina.** Ferguson, R. National Inst. for Occupational Safety and Health, Morgantown, WV (USA). Jan 1989. 28p. (MHETA–87-110-1943). Available from NTIS, PC A03/MF A01.

In response to a request from the U.S. Department of Agriculture, a study was made of possible hazardous working conditions at the Columbia Farms (SIC-2016) poultry processing center, West Columbia, South Carolina. Over 100,000 chickens were processed per day at the facility. The facility was located adjacent to the West Columbia water treatment site and was first on the water line to receive water from the site. In April of 1986 a change was made in the form of water treatment from chloration to chloramination for cost effectiveness, more stable water treatment, and lower trihalomethane levels in finished water. Workers in the inspection area experienced eye, nose, and throat irritation which was traced to uncombined ammonia and chloramines in the water at the processing facility. Concentrations of these chemicals in the water were quite variable. The author concludes that the symptoms in the workers may have resulted from high levels of ammonia and chloramines on some days. The author recommends that the water-treatment facility change from post ammoniation to pre ammoniation, or that the food-processing facility should explore the possibility of another source of water or treatment of the incoming water to remove the chloramines.

43392 (PB–89-188015/XAB) **Health-hazard evaluation report No. HETA-88-054-1936, US Customs Service, Washington, DC.** Reh, C.M. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Nov 1988. 21p. (HETA–88-054-1936). Available from NTIS, PC A03/MF A01.

An investigation was made of possible hazardous working conditions at the headquarters of the U.S. Customs Service, Washington, D.C. An electrical transformer located in the headquarters building leaked about 30 gallons of a cooling oil known to contain polychlorinated biphenyls (PCBs) in the fall of 1987. Air and surface sampling was performed in and around room B100 where the transformer vault was located. Area air sampling found no detectable levels of PCBs in the vault, in other areas of the room, in an adjacent office and projection room, or in the hallway. Surfaces within the room, including the vault, were heavily contaminated with PCBs with surface concentrations ranging from 3720 to 148,000 micrograms per square meter (microg/sq m). The basement hallway had surface concentrations of 224, 234, and 321microg/sq m. Surface sampling in a nearby office room showed PCB levels to be well below the recognized background concentration. There was a potential health hazard from PCB surface contamination in Room B100. Levels in adjacent areas were above background levels. Specific cleanup recommendations are made.

43393 (PB–89-188064/XAB) **Health-hazard evaluation report No. HETA-88-258-1941, University Hospital, Denver, Colorado.** Gunter, B.; Daniels, W. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Dec 1988. 17p. (HETA–88-258-1941). Available from NTIS, PC A03/MF A01.

In response to a request from the University Hospital, Denver, Colorado, an evaluation was made of possible hazardous working conditions at this site. Particular attention was given to waste anesthetic gases and vapors in the surgical operating rooms and in the recovery room. In 19 personal samples the time weighted average concentrations of nitrous oxide (N_20) ranged from less than the limit of detection to 77 parts per million (ppm) with a mean concentration of 17 ppm. The NIOSH recommended limit of 25 ppm was exceeded in five of 19 samples. Personal breathing samples were collected and sampled for halothane, ethrane, and isoflurane. Halothane was detected in seven of 24 samples ranging from 0.09 to 1.6 ppm. The NIOSH recommended limit for halothane of 0.5 ppm was exceeded in three samples. Ethrane was detected in five samples at 0.06 to 1.5 ppm concentration levels, with two exceeding the NIOSH limit of 0.5 ppm. Isoflurane was detected in six samples, ranging from 0.06 to 0.99 ppm, with three samples exceeding the NIOSH limit of 0.5 ppm. The authors conclude that a hazard existed from exposure to anesthetic gases and vapors during some of the procedures. Detailed recommendations regarding specific control procedures, work practices, and monitoring procedures were made.

43394 (PB–89-188080/XAB) **Health-hazard evaluation report No. HETA-88-166-1944, Hoeganaes Magnetic Materials, Rancocas, New Jersey.** Hales, T.R.; Burr, G.A. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jan 1989. 20p. (HETA–88-166-1944). Available from NTIS, PC A03/MF A01.

An evaluation was undertaken of possible hazardous working conditions at Hoeganaes Magnetic Materials, Rancocas, New Jersey. Dermatitis and gastrointestinal problems were cited in the request. Magnets were produced at the site which contain the pyrophoric rare earth metals dysprosium and neodymium along with other materials. Personal breathing zone and general area air samples were taken for trace metals. Concentrations of iron oxide

ranged from 0.05 to 9.5 mg/cu m. Neodymium concentrations ranged from 0.0 to 5.0 mg/cu m with the highest levels occurring in the powder processing room where the magnetic powders were crushed, blended and milled. Concentrations of dysprosium ranged from 0.002 to 0.53 mg/cu m. Concentrations of thallium ranged from 0.02 to 0.16 mg/cu m. Lead was detected in two samples at 0.002 to 0.013 mg/cu m. The authors conclude that a hazard existed due to exposures to neodymium and iron-oxide. Thallium exposures may present a hazard if in soluble form. The authors recommend the reduction of worker exposure to neodymium, iron and thallium through engineering controls using local exhaust ventilation at the crushing, blending and jet milling operations. A respirator program should be implemented.

43395 (PB–89-188098/XAB) **Health-hazard evaluation report No. HETA-84-474-1946, Electric Boat Division, General Dynamics Corporation, Groton, Connecticut.** McManus, K.P.; Moseley, C.; Lowry, L.K.; Hattis, D.; Berg, R. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jan 1989. 108p. (HETA–84-474-1946). Available from NTIS, PC A06/MF A01.

See also PB–85-100865.

An evaluation was made of possible hazardous working conditions at the Electric Boat Division of General Dynamics Corporation, Groton, Connecticut. The request concerned the potential for reproductive effects stemming from employee exposure to glycol ethers during submarine construction and refitting operations at this site. About 800 workers were potentially exposed during the application of coatings. The primary solvent in epoxy paints used at this facility was 2-ethoxyethanol (2-EE). Breathing zone airborne exposures to 2-EE ranged from nondetectable to 84.3 mg/cu m, with a mean concentration of 9.9 mg/cu m. Exposures to 2-methoxyethanol ranged up to 17.2 mg/cu m. A potential health hazard existed as a result of exposure to 2-EE at the time of the survey. The author recommends that worker exposure to glycol ethers be reduced to the lowest possible extent, that workers possibly exposed to these chemicals be provided with and required to use personal protective equipment, and that a continuous program of biological monitoring and industrial hygiene assessment be instituted for these workers.

43396 (PB–89-188114/XAB) **Health-hazard evaluation report No. HETA-87-099-1938, Louisiana-Pacific Corporation, Olathe, Colorado.** Daniels, W.J.; Hales, T.; Seligman, P. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Dec 1988. 45p. (HETA–87-099-1938). Available from NTIS, PC A03/MF A01.

An investigation was made at the Louisiana-Pacific Corporation, Olathe, Colorado, of respiratory problems possibly due to exposures at the workplace. The company produced waferboard using a heat- and pressure-cured resin/wax binding material containing 4,4-methylenediphenyl-isocyanate (MDI). Thirteen cases of pulmonary disease (12 cases of asthma and one case of hypersensitivity pneumonitis) were identified by medical testing in three current and 10 former employees. Two of 23 personal air samples contained quantifiable concentrations of MDI, for time-weighted average concentrations of 0.015 and 0.016 mg/cu m, below the NIOSH recommended exposure limit of 0.05 mg/me. The authors conclude that a potential health hazard existed from airborne exposure to diisocyanates. There may be a risk of significant exposure during maintenance activities if proper personal protective equipment is not used. Previously sensitized workers may react at very low concentrations. The authors recommend that engineering controls be maintained at a high level, that good housekeeping practices be adhered to, that a regular program of air monitoring be instituted, that signs warning the danger of exposure to diisocyanate be posted, that employees be instructed in the use of personal protective equipment, and that a program for medical screening be adopted.

43397 (PB–89-189401/XAB) **Crop loss due to the ozone in New England. Technical report.** Maldonato, T.J. Rutgers–the State Univ., New Brunswick, NJ (USA). 1988. 33p. Available from NTIS, PC A03/MF A01.

The report is part of the National Network for Environmental Management Studies under the auspices of the Office of Cooperative Environmental Management of the U.S. Environmental Protection Agency. Ozone is known to damage crops and forests; a national estimate of its detrimental effects on crops is 2-3 billion dollars per year. This paper quantifies the economic losses in New England due to ozone exposure. The monitored ozone values for each of the New England States and their means are established. The major cash crops grown in the area and their cash values are also presented. Using the Weibull function, a dose-response calculation for specific crops, a dollar value for crop loss is calculated. The dollar value for four crops (corn, hay, tobacco, and sweet corn) is estimated at approximately 12 million dollars (for the 1986 growing season). The New England forest species that are sensitive to ozone damage are also presented. Based on the lack of established Weibull functions for the other cash crops grown in New England and the lack of a method to quantify the cash value of forest damage due to ozone, the paper concludes that the economic loss in New England due to ozone is at least 12 million dollars per year.

43398 (PB–89-196828/XAB) **Effects of burn rate, wood species, moisture content, and weight of wood loaded on woodstove emissions. Report for December 1984-December 1985.** Leese, K.E.; Harkins, S.M. Research Triangle Inst., Research Triangle Park, NC (USA). May 1989. 400p. Available from NTIS, PC A17/MF A01.

This report gives results of tests of four woodstove operating parameters (burn rate, wood moisture, wood load, and wood species) at two levels each using a half-factorial experimental test design to determine statistically significant effects on the emission components CO, CO_2, particulate matter, total extractable organics (TEOs), polycyclic aromatic hydrocarbons (PAHs), C1-C7 hydrocarbons, metals, and the Ames plate incorporation bioassay mutagenic potential. Results showed that increasing burn rate lowered CO, particulate matter, TEO, and C1-C7 hydrocarbon emission rates. Increasing burn rate raised emission rates of individual PAHs and several metals, and also the mutagenic potential of the emissions. All of these effects were significant at the 90% or better confidence interval. At the 90% or better confidence interval, reducing wood moisture increased the particulate emission factor, while concentrations of several PAHs in the stack gas were lowered. Changing from pine to oak increased K emissions at the 90% confidence interval.

43399 (PB–89-861405/XAB) **Ozone depletion studies. January 1972-April 1989 (Citations from the International Aerospace Abstracts data base). Report for January 1972-April 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 88p. Available from NTISPC N01/MF N01.

U.S. sales only.

This bibliography contains citations concerning studies of atmospheric chemistry and modelling of ozone depletion in Antarctica, and the consequences of the depletion on ultraviolet radiation levels. The studies involve chemical reactions in the atmosphere, including temperature dynamics, possible changes in solar insolation, and effects of pollution from nitrogen, chlorofluorocarbons, carbon dioxide, and methane. The studies involve references to observations of the ozonosphere and modelling of interactions worldwide, together with data on the sources of the natural and man-made pollutants. (Contains 187 citations fully indexed and including a title list.)

43400 (PW–8805) **Indoor air quality building studies, 1987-1988.** Public Works Canada, Ottawa, ON (Canada). 1988. vp. (CE–02704). Available from Canada. Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report is a collection of 8 indoor air pollution studies conducted in 1987-88 by the Building Performance Division of Public Works Canada. The environmental assessment comprises monitoring volatile organic compounds and microbials and other particulates. Recommendations are made in order to reduce air pollution. 3 refs., 10 figs., 26 tabs.

43401 (PW–8806-4) **Indoor air quality test kit user manual.** Public Works Canada, Ottawa, ON (Canada). 1988. vp. (CE–02709). Available from Canada. Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Complaints about air quality in office buildings have increased considerably in the last 10 years, as energy consrervation measures have been implemented that sealed buildings more tightly and cut down the amount of fresh air being circulated. Because of the similarity in the symptoms of illness reported, the problem is often referred to as sick building syndrome. However, an approach based on investigating the buildings rather than the symptoms has proved to be more successful. The report lists air pollutants and their sources. An occupant complaint sheet is given. The report explains how to use various pollutant monitors and report the findings: CO_2, CO, formaldehyde, radon, NO_2, O_3, toluene, and particulates. Relative humidity and temperature should also be monitored. Ranges of acceptable values for each type of measurement are given. 8 figs., 2 tabs.

43402 (PW–8806-5) **Indoor air quality test kit maintenance manual.** Public Works Canada, Ottawa, ON (Canada). 1988. vp. (CE–02708). Available from Canada. Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This manual contains copies of the manuals supplied by the manufacturers for all of the equipment in the test kit. The test kit is made up of the following: Fuji ZFP5 CO2 monitor, ISD CO260 CO monitor, STC formaldehyde Kit, Gastec tubes, and carbon dioxide and carbon monoxide monitors. A list of spare parts kept by the Building Performance Division of Public Works Canada is also included. Building Performance has carried out evaluations of the equipment in the test kit. Part of the information acquired has been included in the User Manual. The remainder is given here. 67 figs., 5 tabs.

43403 (PW–602031) **Methods for measuring volatile organic compounds, and types of chemicals found in building air.** Kerr, G. Public Works Canada, Ottawa, ON (Canada). 1988. 71p. (CE–02707). Available from Canada. Public Works Canada, Information Research & Library Services, Sir Charles Tupper Bldg., Confederation Heights, Ottawa, ON, CAN K1A 0M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report contains: an evaluation of the different methods used by the Building Performance Division of Public Works Canada to measure volatile chemicals in indoor air, procedures for applying these methods in the field, and discussion and analysis of the results of case studies carried out using these methods within Canadian buildings. The 3 measurement methods evaluated have different strengths and different applications. The Environmental Health Centre Laboratory (EHCCL) uses an accredited method which determines the concentrations of individual chemicals in air; it should be used when comparisons with indoor air quality standars are required. The National Research Council (NRC) method samples a larger number of chemicals and determines their combined concentrations in air; it should be used when comparisons with indoor air quality standards are required. The National Research Council (NRC) method samples a larger number of chemicals and determines their combined concentration in air; the analysis is less time-consuming, and simpler to use in identifying complex chemical sources. Simple proccedures are given for the collection of samples for analysis by the EHCL and NRCC methods and for the operation of the photo-ionization detectors. The case studies indicated that hydrocarbons occur more frequently in building air than chlorinated hydrocarbons. Most of the chemicals found were associated with activities included printing, photocopying, painting and carpet laying. None of the measured concentrations exceeded the recommended limits.

43404 (SBM–8308) **Indoor air pollution and housing technology. Research report.** Small, B.M. Small (B.M.) and Associates Ltd., Goodwood, ON (Canada). 1983. 295p. (CE–02703). Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

This study reviews the scientific literature on indoor air pollution. Many materials and conditions which contribute significantly to indoor air pollution are known to be present in Canadian homes. Major pollutants include carbon monoxide, nitrogen oxides, radon gas, formaldehyde, tobacco smoke, ozone, asbestos, dust and mold, bacteria and viruses, and a host of organic chemical vapors, some of which are known or suspected carcinogens. The study states that indoor air pollution is a total population problem and that a significant number of Canadians are in high-risk categories with respect to pollutant exposure. There is a small but growing population of chemically susceptible persons in Canada who require low-pollution housing, low-pollution design and construction. Techniques employed in Sunnyhill Low-Pollution Research Centre are outlined and suggestions are made on their applicability to new and existing housing in Canada. Further research and discussion on this subject is advocated.. 376 refs., 28 figs., 42 tabs.

43405 Detection of multiply deuterated methane in the atmosphere. Mroz, E. J. (Isotope Geochemistry Group, Los Alamos National Laboratory, Los Alamos, New Mexico (US)); Alei, M.; Cappis, J. H.; Guthals, P. R.; Mason, A. S.; Rokop, D. J. *Geophysical Research Letters (USA),* 16(7): 677-678 (Jul 1989).

Measurements of the isotopic composition of methane in the Antarctic atmosphere have indicated the presence of either $^{12}CD_4$ or $^{12}CHD_3$. The concentration is about 1.3×10^{-16}(v/v). This concentration is at least 500 times higher than expected from the statistical combination of the natural isotopic abundances of H, D, ^{12}C and ^{13}C. There are no known sources of these species large enough to explain these concentrations. It is possible that these species have accumulated in the atmosphere by virtue of having atmosphere residence times that are substantially longer than the residence time of CH_4. © American Geophysical Union 1989

43406 Pollutant transport and diffusion in katabatic flows. Nappo, C. J. (Atmospheric Turbulence and Diffusion Division, NOAA/ARL, Oak Ridge, Tennessee (US)); Rao, K. S.; Herwehe, J. A. *Journal of Applied Meteorology (USA),* 28(7): 617-625 (Jul 1989).

The characteristics of pollutant transport and diffusion of a passive contaminant in a two-dimensional katabatic flow over a simple slope are examined using a primitive equation hydrodynamic model. It is shown that pollutants released above the drainage layer can be entrained into the layer and diffused to the ground surface. For elevated releases within the drainage layer, subsidence in the flow leads to relatively high surface concentrations of pollutants close to the stack. Pollutants released at ground level can spread through the entire depth of the drainage layer. This vertical diffusion is more effective for a shallow slope, resulting in higher concentrations at all heights, than for a steeper slope. These dispersion characteristics are quite different from those for stable flows over flat terrain. The differences result from increases of boundary-layer depth, wind speed, and turbulence as the katabatic flow develops downslope.

43407 Early morning ventilation of a gaseous tracer from a mountain valley. Orgill, M. M. (Atmospheric Science Department, Pacific Northwest Laboratory, Richland, Washington (US)). *Journal of Applied Meteorology (USA),* 28(7): 636-651 (Jul 1989). DOE Contract AC06-76RL01830.

An important component of a joint Environmental Protection Agency—Department of Energy field experiment in Brush Creek Valley, Colorado in July–August 1982, was an aircraft sampling task to help verify the early morning ventilation of a gaseous tracer from the valley. The aircraft sampling supplemented a surface sampling network in the 650 m deep northwest-southeast oriented valley. A 100 m elevated tracer release 11 km up Brush Creek Valley from its confluence with Roan creek Valley was sampled using an airborne real-time tracer analyzer supplemented with periodic grab bag samples. Three experiments were conducted in the early morning hours (0400–1000 MST) of 31 July, 4 August, and 6 August.

43408 Numerical simulation of cross-valley plume dispersion during the morning transition period. Bader, D. C. (Pacific Northwest Laboratory, Richland, Washington (US)); Whiteman, C. D. *Journal of Applied Meteorology (USA),* 28(7): 652-664 (Jul 1989). DOE Contract AC06-76RL01830.

A two-dimensional dynamical model was used to simulate the daytime boundary-layer evolution and resulting plume dispersion in a cross-valley section of a northwest-southeast oriented narrow valley in the first 4 h after sunrise. Two cases were simulated, one

using a summertime heating distribution and a second with a wintertime heating distribution. In each case, additional conservation equations were added to simulate the dispersion of two plumes released 150 m and 650 m above the valley floor. In the summer case, the lower plume migrated to the more strongly heated southwest sidewall in the first 90 min after sunrise, and was then advected up the sidewall in the slope flow for the remainder of the simulation. This result is consistent with observations. The upper plume diffused slowly in the remnants of the nocturnal inversion layer until it was entrained by the growing convective boundary layer 3 h after sunrise. The boundary layer's thermodynamic structure remained nearly symmetric about the valley axis throughout the transition period. The asymmetric dispersion characteristics seen in the summer case were not found in the winter simulation. The seasonal change in solar illumination reduced the differences in surface heat flux between the two sidewalls that gave rise to the asymmetry observed in the summer case.

43409 Transferability of a three-dimensional air quality model between two different sites in complex terrain. Lange, R. (Lawrence Livermore National Laboratory, University of California, Livermore, California (US)). *Journal of Applied Meteorology (USA)*, 28(7): 665-679 (Jul 1989). DOE Contract W-7405-ENG-48.

The three-dimensional, diagnostic, particle-in-cell transport and diffusion model MATHEW/ADPIC is used to test its transferability from one site in complex terrain to another with different characteristics, under stable nighttime drainage flow conditions. The two sites were subject to extensive drainage flow tracer experiments under the multilaboratory Atmospheric Studies in Complex Terrain (ASCOT) program: the first being a valley in the Geysers geothermal region of northern California, and the second a canyon in western Colorado. The domain in each case is approximately 10×10 km. The 1980 Geysers model evaluation is only quoted. The 1984 Brush Creek model evaluation is described in detail.

43410 Morning transition tracer experiments in a deep narrow valley. Whiteman, C. D. (Pacific Northwest Laboratory, Richland, Washington (US)). *Journal of Applied Meteorology (USA)*, 28(7): 626-635 (Jul 1989). DOE Contract AC06-76RL01830.

Three sulfur hexafluoride atmospheric tracer experiments were conducted during the post-sunrise temperature inversion breakup period in the deep, narrow Brush Creek Valley of Colorado. Experiments were conducted under clear, undisturbed weather conditions.

43411 Two-photon spectroscopy at ultrahigh resolution: Fine structure and hyperfine structure of the $(3s\sigma)A\ ^2\Sigma+(v=1,N=3)$ Rydberg state of NO. Miller, R. J. (Atomic and Molecular Chemistry Section, Pacific Northwest Laboratory, Richland, Washington 99352 (US)); Glab, W. L.; Bushaw, B. A. *Journal of Chemical Physics (USA)*, 91(5): 3277-3279 (1 Sep 1989). DOE Contract AC06-76RL01830.

The utility of ultrahigh resolution, continuous-wave laser sources in multiphoton spectroscopy is demonstrated by measurements of fluorescence excitation spectra resulting from two-photon pumping of individual rotational branches of $(3s\sigma)A\ ^2\Sigma+(v'=1,N'=3)\leftarrow X\ ^2\Pi(v'=0)$ NO. The general physical significance of fine structure and hyperfine structure interactions is briefly discussed emphasizing their relation to dynamical phenomena. Current observations yield the following fine structure and hyperfine structure parameters characterizing $A(v=1,N=3)$ NO: $\gamma=-80.10\pm0.04$ MHz, $b=40.9\pm0.2$ MHz, $c=1.5\pm4.5$ MHz, and $eQq=-7.2\pm0.5$ MHz. The effective cross section for two-photon excitation of $R_{11}(J'=2.5)$ is estimated from experimental observables to be 1×10^{-44} cm^4 s.

5003 Radioactive Materials Monitoring and Transport

Refer also to citation(s) 42103, 43201, 43450

43412 (AECL–9507) **ATMOS: a model of radionuclide migration in the atmosphere.** Wilkinson, S.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Oct 1987. 14p. Order Number DE89635132/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

For use with scenarios involving airborne contamination, an atmospheric transport model called ATMOS has been developed for the safety assessment code COSMOS-S/D. It is a one-wind Gaussian plume model, made more general using wind-rose information that calculates ground-level air concentration factors at a common receptor point for each of a number of sources. These multiply a source strength, calculated elsewhere, to obtain the actual airborne radionuclide concentrations. The model presented in this report is an improved version of the original. Accounting is now made of area of the source region, and plume depletion by both wet and dry deposition mechanisms.

43413 (BNWL-CC–167) **Proposal for second Hanford iodine-131 field release test.** Watson, E.C. Battelle Pacific Northwest Lab., Richland, WA (USA). 22 Jul 1965. 31p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. Order Number DE89015086/JAW. Available from NTIS, PC A03/MF A01 - OSTI.

It is proposed to release two curies of iodine-131 to the atmosphere, at a point near the meteorology tower. The height of release would be about five feet above the ground. The principal objective of controlled atmospheric releases of iodine-131 is to determine the environmental consequences of an accidental emission. The proposed release of iodine-131 has the following objectives: will determine atmospheric diffusion parameters for molecular iodine released, as an aerosol, during stable atmospheric conditions; will determine possible chemical and physical changes of the released iodine as a function of downwind distance, travel time and atmospheric characteristics; and will determine the time-integrated air concentration at ground level of iodine-131 found as a function of downwind and horizontal cross-wind distances. 4 refs., 4 figs., 5 tabs.

43414 (CEA-R–5484) **Development of a calibration stand for the monitoring of atmospheric contamination by means of standard radioactive aerosols.** Ammerich, M. Conservatoire National des Arts et Metiers (CNAM), 75 - Paris (France); CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection Technique. 1989. 228p. (In French). Order Number DE89908155/JAW. Available from NTIS (US Sales Only), PC A11/MF A01.

After a reminder of both the main physical laws governing aerosols and fluid mechanics, the methods and technologies used to develop a calibration equipment for the monitoring of atmospheric contamination by means of standard radioactive aerosols are presented. The preliminary tests checked the chief performances of the stand, the characteristics of which had been established for the purpose of the certification of atmospheric contamination monitors. These 'dynamic' tests were devised to measure the coefficient of the effect of natural radioactivity on the measurement of man-made activity and the measurement efficiency of artificial alpha and/or beta activity for a given installation. The tests conducted on the various components of the stand demonstrated the good operation of the installation, which allowed to carry out certification tests on three detectors.

43415 (INIS-mf–11483, pp. 9) **Comparison of various systems of diffusion parameters for the calculation of the downwind- and crosswind activity concentration due to stack releases.** Beutmann, A. (Zentralinstitut fuer Kernforschung, Rossendorf (German Democratic Republic)); Rossbander, W.; Sahre, P. Technische Univ., Dresden (German Democratic Republic). Sektion Physik. 1989. (CONF-8904255–: 21. international symposium radiation protection physics, Bad Schandau (German Democratic Republic), 3-7 Apr 1989). In *Abstracts of 21. International Symposium Radiation Protection Physics.* Order Number DE89633108/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Abstract only.

43416 (Juel-Conf–69, pp. 428-458) **Environmental monitoring of nuclear facilities.** Koelzer, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Internationales Buero. 1988. (CONF-8610246–: 15. annual convention of the Indonesian Petroleum Association, Jakarta (Indonesia), 7-9 Oct 1986). In *Joint German-Indonesian seminar on public acceptance, waste-management, and nuclear safety.* Order Number DE89795784/JAW. Available from NTIS (US Sales Only), PC A21/MF A01.

Environmental monitoring of nuclear facilities is part of general monitoring for environmental radioactivity all over the territory of the Federal Republic of Germany. General principles of environmental monitoring were formulated by the ICRP in 1965. In 1974 guidelines for measures of monitoring the environment of NPP incorporating LWR were drafted, which helped to standardize environmental monitoring programs. Since 1958, data on environmental radioactivity from measurements by authorized laboratories have been published in reports. (DG).

43417 (PB–89-172308/XAB) **Seasonal variations of radon and radon decay-product concentrations in single-family homes. Final report.** Hans, J.M.; Lyon, R.J. Environmental Protection Agency, Las Vegas, NV (USA). Office of Radiation Programs. Aug 1986. 46p. (EPA–520/1-86/015). Available from NTIS, PC A03/MF A01.

Radon and radon decay-product concentrations were measured weekly for a period of 1 year in 20 homes. A seasonal cycle was observed for the radon concentrations, with a low during the warmer months and a high during the cooler months of the year. Radon decay-product concentrations were found to generally follow the radon cycle, as expected. The equilibrium ratio was observed, however, to vary inversely with the radon and radon-decay product cycles. The indoor radon cycle for the 20 homes was also found to follow the inverse of the outdoor radon concentrations. Some speculation and supporting data are presented to explain the inverse indoor and outdoor relationships.

43418 (PB–89-863864/XAB) **Radon detection and measurement. January 1970-May 1989 (Citations from the COMPENDEX data base). Report for January 1970-May 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 112p. Available from NTISPC N01/MF N01.

Supersedes PB–88-868880.

This bibliography contains citations concerning the measurement of radon and radon-daughter isotopes in various environments. Radon measurement in homes and buildings, mines, rainwater, groundwater, soils, in the Arctic and other atmosphere, and in exhaled air is discussed. Radon-exhalation rates of building materials and mine tailings are noted. Analytic methods and equipment used to measure radon and radon isotopes are described. Radon detection as an earthquake prediction tool is briefly presented. (This updated bibliography contains 250 citations, 11 of which are new entries to the previous edition.)

43419 (PB–89-169866/XAB) **Data-assessment reports for CEMS (continuous emission monitoring systems) at Subpart DA facilities.** Walsh, G. Entropy Environmentalists, Inc., Research Triangle Park, NC (USA). Mar 1989. 55p. Available from NTIS, PC A04/MF A01.

EPA promulgated minimum quality assurance (QA) requirements for Continuous Emission Monitoring Systems (CEMS) in 40 CFR Part 60 Appendix F. Appendix F requires the development of site-specific QA plans and the reporting of results of EPA specified QA activities each calendar quarter. The report of QA activities under Appendix F is called a Data Assessment Report (DAR). The DAR includes identifying and descriptive information for the CEMS, results of periodic audits, identification of periods when calibration drift exceeds specified criteria, identification of periods when the analyzers or CEMS are out of control (OOC), and descriptions of corrective actions in response to OOC conditions. The principal objective of the study is an evaluation of the information in DARs for the first and second quarters of calendar year 1988. Secondary study objectives include the establishment of contacts with agency staff who normally receive the DARs each quarter and identification of facilities for which DARs were apparently not received, for follow-up by the appropriate agency.

43420 (PB–89-169973/XAB) **Review of current methods for measuring particulate matter including condensables from stationary sources. Final report.** McCain, J.D.; Williamson, A.D. Southern Research Inst., Birmingham, AL (USA). Feb 1989. 31p. Available from NTIS, PC A03/MF A01.

The PM10 ambient-air particulate concentration standard has created a need for updating measurement methods for PM10 emissions (nominally 10 micrometers aerodynamic diameter and smaller) from stationary sources. Condensable emissions can be a significant portion of stack emissions. Further, since these substances primarily condense to particles less than 10 micrometers in diameter, they form a greater percentage of the PM10 fraction than of the total particulate matter emissions. Therefore, the need arises for developing a source test method which includes the condensable component of emissions. A review of possible techniques was conducted to determine current methodology and to make recommendations for research. Research is recommended on two approaches. One is a dilution method that simulates plume formation by mixing stack gases with conditioned ambient air and the other is an adaptation of utilizing the Method 5 back-half catch.

43422 (AD-A–206240/4/XAB) **Development of a computerized penetrometer system for hazardous-waste-site soils investigations. Final report, September 1986-August 1988.** Cooper, S.S.; Malone, P.G.; Olsen, R.S.; Douglas, D.H. Army Toxic and Hazardous Materials Agency, Aberdeen Proving Ground, MD (USA). Technology Div. 30 Aug 1988. 79p. (AMXTH-TR-TE–88242). Available from NTIS, PC A05/MF A01.

An instrumented cone-penetrometer system was developed for use in the investigations of soils at hazardous-waste sites. The penetrometer is based on designs used for foundation investigations and includes instrumentation to measure tip penetration resistance, sleeve friction, and electrical resistivity. The unit includes a computer-based data-acquisition system that records input from the sensors and calculates indices related to the soil type. The resistivity module can detect the presence of soil contaminants that change the electrical properties of the soil. Field trials conducted with the penetrometer at Louisiana Army Ammunition Plant showed the penetrometer could be used to trace soil types and determine the extent of soil contamination at a closed waste-water evaporation pond. The penetrometer results were confirmed using standard soil sampling and laboratory-analysis techniques. The penetrometer produced no cuttings that required disposal, and the unit could be rapidly decontaminated.

43423 (AD-A–206244/6/XAB) **Environmental interactions of hydrazine fuels in soil/water systems. Final report, March 1985-September 1987.** Street, J.; Johnston, C.; Mansell, R.; Bloom, S.

Florida Univ., Gainesville, FL (USA). Dept. of Soil Science. Oct 1988. 312p. Available from NTIS, PC A14/MF A01.

Because the Air Force is the primary user of the rocket fuels, hydrazine (Hz), monomethylhydrazine (MMH), and 1,1-dimethylhydrazine (UDMH), it is responsible for the environmental implications associated with the transport, storage, and handling of these fuels. During handling, hydrazine fuels could inadvertently be released to the atmosphere and the surrounding aqueous and terrestrial environments. The studies are divided into the following five areas: aqueous and soil suspension studies, surface interaction studies, biological interaction studies, soil column studies, and soil transport modeling. The objective of this work is to determine the fate of hydrazine fuel released into an aqueous or soil environment. Aqueous degradation studies reveal that the extent of hydrazine degradation and the products formed are highly dependent upon several variables. Among these include the type of container used in the studies, the presence of certain metal ions, the ionic strength, the presence and type of pH buffer, the temperature, the presence of bacteria, and the amount of dissolved oxygen. Aqueous hydrazine degradation is particularly rapid in quartz vessels with copper ions ions and oxygen present. Degradation also increases with increasing ionic strength, pH buffer concentration, temperature, and bacteria content.

43424 (AD-A–206929/2/XAB) **Solid-waste-assessment testing. Installation-restoration program. State 3. McClellan Air Force Base. Final report, November 1987-December 1988.** Radian Corp., Sacramento, CA (USA). 30 Dec 1988. 275p. Available from NTIS, PC A12/MF A01.

Availability: Document partially illegible.

This document reports the sampling and analytical results of the gas-generation and gas-migration testing at 13 inactive landfills, and the vapor wells and gas vents associated with the Area D clay cap remedial action. This report and testing were performed at McClellan AFB in compliance with the California Health and Safety Code Section 41805.5.

43425 (CONF-8906190–1) **Performance of in situ soil venting system at jet fuel spill site.** DePaoli, D.W.; Herbes, S.E.; Elliott, M.G. Oak Ridge National Lab., TN (USA). [1989]. 22p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. From EPA soil vapor extraction technology workshop; 28 Jun 1989. Order Number DE89015870/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Air Force Engineering and Services Center and Oak Ridge National Laboratory (ORNL) are performing a field demonstration of in situ venting at a 27,000-gal jet fuel spill site at Hill Air Force Base (AFB), Utah. In situ soil venting is a soil cleanup techniques that uses vacuum blowers to pull large volumes of air through contaminated soil. The air flow sweeps out the soil gas, disrupting the equilibrium existing between the contaminants on the soil and in the vapor. This causes volatilization of the contaminant and subsequent removal in the air stream. In situ soil venting has been used for removing volatile contaminants such as gasoline and trichloroethylene, but a full-scale demonstration for removing jet fuel from soil has not been reported. This paper briefly describes the jet fuel spill site and the design and results to date of our full-scale in situ soil venting system. 8 refs., 9 figs.

43426 (CPS–8702) **Proceedings [of the] 4th technical seminar on chemical spills.** Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. 362p. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A conference on chemical spills presented papers in the fields of fate and behavior of various chemical products such as heavy gases and fuels; mathematical modelling of spills; spill countermeasures and site restoration; analysis and detection of hazardous materials and contaminants; and research connected with specific spill events. Separate abstracts have been prepared for 14 papers from this conference.

43427 (CPS–8702, pp. 77-113) **Quantification of fire hazards of liquid spills from tank trucks.** Crocker, W.P. (Univ. of Toronto, Toronto, ON, Canada); Napier, D.H. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The quantification of fire hazards associated with the bulk transport of liquid by road carrier is considered by studying two classes of liquids, flammable liquids and liquefied petroleum gases, in view of the differing fire hazards that they present. The vehicle configuration chosen in this study is the tractor plus semitrailer. Several fire systems were modelled for each class. Confined and unconfined pool fires were considered for flammable liquids and fireballs were modelled for propane and butane. In different accident scenarios, distances for various levels of thermal radiation and for contact ignition were predicted. Flammable liquid spills of ethanol, gasoline, hexane, kerosene and toluene were compared. Models of thermal radiation of fires are described including the model limitations. Significant findigns include the following. For confined pool fires, toluene is the most hazardous of the fuels considered, and ethanol the least. Atmospheric attenuation caused reductions up to 20% (confined pool fire) in the hazard distances predicted. Ethanol represents the greatest contact ignition hazard from catastrophic failure of tank contents (175 m for 40,000 kg spilled). Buildings are in hazard from unconfined pool fires (catastrophic failure), e.g. 176 m from pool centre for kerosene based on spontaneous ignition. Maximum radius for 1% lethality is 318 m for kerosene (40,000 kg spilled). Radius for blistering of skin is 553 m. Propane is more hazardous than butane: the distance to the pain threshold for propane is 487.6 m for 27 tonnes released, 278 m for butane. Models for confined and unconfined pool fires (catastrophic failure) are found to be suitable for use in hazard assessment. 30 refs., 18 figs., 21 tabs.

43428 (CPS–8702, pp. 53-76) **Modelling the evaporation of volatile liquids and spreading of chemicals on snow and ice.** Kawamura, P.I. (Univ. of Toronto, Toronto, ON, Canada); Mackay, D. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This paper describes studies of two aspects of the short-term behaviour and fate of chemicals resulting from terrestrial chemical spills. In the first study, 2 models were developed to estimate the evaporation rate of liquids. Both models are based on steady heat balances around the chemical pool and include the effects of solar insolation, evaporative cooling, and heat transfer from the ground. The simpler of the two estimates the evaporation rate directly from available physical-chemical data. The second model determines the surface temperature of the evaporating pool by an iterative procedure. This temperature is then used to estimate the evaporation rate. Experiments are described in which the evaporation rates of seven volatile chemicals were measured from pans under known meteorological conditions. The two modes and the experimental evaporation rates were in satisfactory agreement. It is concluded that either model can be used to estimate evaporation rates under actual spill conditions. In the second study, a relatively simple model has been developed to describe the spreading of liquid chemicals on snow and ice. Experiments were performed to determine the spreading behaviour and characteristics and the general phenomena which occur when various chemicals are spilled on snow and ice. The final spill area and the spreading rate results were correlated with the spill volume, viscosity and snow depth and properties. These correlations can be viewed as comprising part of the general spreading model, and are believed to enable predictions

to be made of the spreading behaviour for most chemcials under actual spill conditions. 4 refs., 4 figs., 5 tabs.

43429 (CPS–8702, pp. 21-41) **A rapid assessment model for spills on soil of oily fluids that are immiscible with water.** Metcalfe, D.E.; Zukovs, G. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A subsurface transport model has been developed for spills on soil of oily fluids that are immiscible with water. This rapid assessment tool has been developed for spill respondents who are not necessarily contaminant transport specialists for use in evaluating the environmental severity and impacts of spills and determining the need for emergency actions. As such, model inputs are limited to the key data requirements, with guidelines provided on the selection of those data. The model equations are presented in nomogram format, allowing the migration distances and times of the conta minant fluid to be obtained. The model accounts for the downward migration of contaminant fluids and the behavior of these fluids at the water table, for both fluids that are less dense and more dense than water. The nomograms describing these phenomena are based on Dracian flow concepts and published experimental work. Step-by-step instructions are provided in a worksheet format on the use of the nomograms for obtaining estimates of depths of penetration at specified times, the time of penetration to the water table, the extent of potential contamination at the water table, and the ultimate subsurface configuration of the contaminant fluid. 17 refs., 10 figs., 3 tabs.

43430 (CPS–8702, pp. 11-20) **Modelling of the spreading of chemical spills on grass and impermeable surfaces.** Belore, R.L. (Ross Environmental Research, Ottawa, ON); McBean, E.A. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Two- and three-dimensional spill models of the spread of liquids on land have been developed. Evaporative and infiltrative fluxes are estimated as losses of liquid, in combination with the surface affinity depth and position-computing methods to develop time-varying spill profiles. The model results are compared with physical modelling experiments. Sensitivity analyses are used to identify parameters to which the model is most sensitive. These analyses indicated that differences in density and contact angle were of lesser importance in forecasting spill excursions than are variations in the slope of the solid surface. Additional, fundamental data characterizing parameters such as friction coefficients and contact angles, as needed for model application, are important for future utility of the model. 16 refs., 9 figs., 2 tabs.

43431 (CPS–8702, pp. 149-163) **A new generation of spill model.** Mackay, D. (Univ. of Toronto, Toronto, ON, Canada); Wilson, D. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Chemical and oil spill modelling has reached a state of limited development. The simple, easily understandable models do not treat all the important processes and may give misleading results. The more comprehensive, complex models can only be understood by the developer. They may contain errors buried in the mass of undecipherable computer code. Neither is satisfactory, but it is not clear how the situation can be improved. It is suggested that a new generation of spill models may be on the horizon which are simple but comprehensive. At any given stage in the spill history, only a few of the many possible flow, transfer and reaction processes are important. Rather than include descriptions of all processes at all times, the user would be able to select and include the important processes, but is advised as to which processes are likely to be most important. As the spill progresses, the user is able to intervene to change the selection of events which occur at specific times such as changing environmental conditions, countermeasures, interactions with shorelines, penetration into soils of differing properties, and interactions with ice. The conditions of the spill can be adjusted to agree with actual observations. The principles underlying this new model approach are described, with reference to chemical and oil spills. 4 refs., 2 figs.

43432 (CPS–8702, pp. 223-228) **Unique hazardous materials spill control agents and methods of application.** Riley, J.F. (Ansul Fire Protetion, Marinette, Wisconsin, USA). Environment Canada, Ottawa, ON (Canada). Conservation and Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A technology is described for treating spills of hazardous materials. This technology is based upon new solid formulations for treating spills of three broad classes of hazardous materials. Three different formulations have been developed for treating acids, caustics and organic solvents and fuels. In most cases these materials react to render a hazardous material into a non-hazardous material. These formulations are mated with external expellent gas cartridge applicators ranging in size from 30 to 5000 lbs. This results in a safe, fast way of reacting to and treating spills of hazardous materials. 3 refs., 5 tabs.

43433 (CSC–143-G-299) **Development of SERTAD. Incorporation of nitrogen chemistry. Part 7.** Davis, C.S.; Fung, C.S. Concord Scientific Corp., Toronto, ON (Canada). 1989. 56p. (CE–02698). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, CAN H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A new version of the Statistical Evaluation of Regional Transport and Acid Deposition (SERTAD) modelling system that incorporates nitrogen chemistry has been prepared. This version, which utilizes the latest formulation of Fisher's statistical model, allows the treatment of two secondary nitrogen species (nitric acid and particulate nitrate in this case) and also allows the deposition velocity and scavenging coefficients of primary and secondary species to be varied independently. The new version includes the treatment of dry deposition for sulphate. The version is limited in that it allows only one rainfall category (compared with 10 in the previous sulfur version) and requires that the two secondary nitrogen species be formed in a fixed ratio to each other. The use of one rainfall category does not appear to be a serious limitation. The new version has been implemented on an IBM compatible personal computer. Preliminary comparisons of model predictions with anuual (1982) wet nitrate deposition data are promising (Pearson correlation coefficients of about 0.7 based on 38 data points using 1980 emissions and meteorological data). More detailed model testing and enhancement to incorporate more rainfall categories, the diurnal and seasonal variation of transformation and deposition and model validation are recommended. 26 refs., 15 figs., 8 tabs.

43434 (DOE/HWP–74) **Hazardous Waste Remedial Actions Program: Annual progress report for the period ending September 30, 1988.** Oak Ridge National Lab., TN (USA). Hazwrap Support Contractor Office. Jul 1989. 207p. Sponsored by

U.S. DOE Defense Programs. DOE Contract AC05-84OR21400. Order Number DE89016429/JAW. Available from NTIS, PC A10/MF A01 - OSTI; GPO Dep.

This report covers the activities of the HAZWRAP Support Contractor Office (SCO) during FY 1988 in support of the three programs. These programs are managed in an interactive fashion, particularly the technology projects. However, each program is administered separately and has its own Program Management Plan. Following a general summary and introduction for HAZWRAP activities, each program is presented separately. Background and summary information are followed by more detailed information. SCO activities are described in substantial detail. The field element task sections constitute separate annual reports for each field task prepared by the principal investigator. In the case of research and development tasks, they are rather extensive. Two appendixes are included: Appendix A lists all of the HAZWRAP documents published in FY 1988, and Appendix B lists all of the formal reports published by HAZWRAP since its inception.

43435 (GEPP-SP-1122) **Pinellas Plant Spill Prevention Control and Countermeasures Plan.** Klein, R.D. General Electric Co., Largo, FL (USA). Neutron Devices Dept. Aug 1988. 35p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00656. Order Number DE89016326/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This Spill Prevention Control and Countermeasures Plan (SPCC) manages emergency response cleanup efforts for the release of oil and petroleum products. A separate document, GEPP-SP-1104, "The Pinellas Plant Contingency Plan for the Hazardous Waste Management Facility," manages emergency response cleanup efforts for the release of hazardous substances. 4 figs., 3 tabs.

43436 (PB-89-180095/XAB) **Electromembrane process for recovery of lead from contaminated soils. Phase 1, final report.** Kemner, W.; Krishnan, R. PEI Associates, Inc., Cincinnati, OH (USA). Jul 1986. 158p. Available from NTIS, PC A08/MF A01.

The research optimized, through bench-scale tests, the process variables for the chelation and electroplating operations of an electromembrane process employing a chelating agent, ethylenediaminetetraacetic acid (EDTA), for recovery of lead in contaminated soils. Preliminary evaluations of process applicability for various sites were conducted, scale-up design criteria were investigated, and the economics of the process were estimated. The process is applicable to a wide variety of lead-containing soils and wastes. Desirable process criteria include uniform size distribution, high soluble lead content, low clay and fines content, and good dewatering characteristics. Economic analyses show its cost to be competitive with off-site disposal options.

43437 (PB-89-181309/XAB) **Gas-chromatographic determination of aviation gasoline and JP-4 jet fuel in subsurface core samples (journal version).** Vandegrift, S.A.; Kampbell, D.H. Northrop Services, Inc., Ada, OK (USA). 1988. 6p. Available from NTIS, PC A02/MF A01.

Pub. in Jnl. of Chromatographic Science, Vol. 26, 566-569(Nov 1988).

A new gas-chromatographic procedure for quantifying levels of aviation gasoline (avgas) and JP-4 jet fuel contamination in soils is described. The fuel is extracted from a small quantity of soil or subsurface material, typically about 6 g, using 3 mL of methylene chloride. The extract is analyzed by wide-bore capillary-column gas chromatography with flame-ionization detection. Advantages of the method are a short analysis time of 20 minutes, the use of small amounts of solvent, detection limit in the low parts-per-million range, and determination of the type of fuel contamination (i.e. avgas or jet fuel) by the chromatographic pattern or fingerprint.

43438 (PB-89-861587/XAB) **Leachate treatment. January 1977-April 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-April 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 140p. Available from NTISPC N01/MF N01.

Supersedes PB-88-857917.

This bibliography contains citations concerning treatability studies on leachate from landfills and solid-waste disposal sites. Biological treatment, chemical coagulation, carbon adsorption, resin adsorption, membrane processes, and stripping are among the treatment processes discussed. (This updated bibliography contains 228 citations, 44 of which are new entries to the previous edition.)

43439 (UCRL-53927) **A summary of research, assessment, and management capabilities applicable to the fields of hazardous waste, toxic materials, and environmental contamination.** Lawrence Livermore National Lab., CA (USA). 13 Apr 1989. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014002/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The Lawrence Livermore National Laboratory has a 30-year history of research and development in energy and weapons technologies. As a result, the Laboratory has developed expertise in dealing with environmental, health, and waste-management problems associated with hazardous and toxic materials. This document, developed by a multidisciplinary working group, outlines the capabilities the Laboratory can bring to bear on issues related to waste, toxic, and environmental problems.

Equilibrium and kinetic sorption models were used to simulate the transport of reactive solutes, ^{85}Sr and ^{51}Cr-EDTA, through small-scale laboratory columns. The least squares fitting procedure was used to calculate the model parameters and to simulate experimental results. Parameters of equilibrium and kinetic models were also determined using time moments analysis. Both methods provide virtually identical estimates of the flow velocity and dispersion coefficient. There is, however, a difference in estimates of rate constants due to sensitivity of the moment calculation procedure to the tail of breakthrough curve. It was concluded that the application of both techniques ensures accuracy in parameter estimation. Equilibrium models based on linear and nonlinear isotherms as well as reversible first order and two-site kinetic models were used to simulate the observed ^{85}Sr breakthrough curves. In view of a good agreement between measured results and those simulated using the two-site kinetic and equilibrium models it was concluded that the equilibrium model may be used for describing the radiostrontium behaviour. The application of two-site kinetic model for simulating ^{51}Cr-EDTA breakthrough curve resulted in the excellent agreement between simulated and observed results. 23 refs.

43441 (CEA-R-5473) **Contribution to the prediction of americium, plutonium and neptunium behaviour in the geosphere: chemical data.** Robouch, P. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Recherche Technologique et de Developpement Industriel (IRDI); Strasbourg-1 Univ., 67 (France). 1989. 216p. (In French). Order Number DE89908104/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

An exhaustive bibliographic review on hydrolysis of americium gives the stability constants, at zero ionic strength. No evidence of $Am(OH)_4^-$ formation was found by solubility studies up to pH < 13. The solubility of solid $Am_2(CO_3)_3$ characterised by its X-ray diffraction pattern is studied at a high ionic strength. All the published results on Am in carbonate media are reinterpreted using these stability constants (Am-OH-CO_3 complexes are not needed). No evidence of $Am(CO_3)_4^{5-}$ formation was found by spectrophotometry up to 3M. Literature results are used to determine the formal redox potentials at pH = 9.4 and to calculate the formation constants, at zero ionic strength. The formation of complexes between americium and humic materials (purified fulvic and humic acids) has been

studied by a spectrophotometric technique. The results are interpreted by the formation of a 1:1 complexe. Solubility of the solid $PuO_2(CO_3)$ is measured in bicarbonate media at high ionic strength, to obtain the solubility product and formation constants of the $PuO_2(CO_3)_i^{2-2i}$ complexes.

Abstract only.

43443 (INIS-mf–11495, pp. 10-13) **Radionuclide migration through large granitoid bodies : selection criteria for high-level nuclear waste disposal sites.** Guthrie, V.A. (Tasmania Univ., Sandy Bay (Australia)). Australian Inst. of Nuclear Science and Engineering, Lucas Heights (Australia). Nov 1987. (CONF-8711312–: 5. Australian conference on nuclear techniques of analysis, 4-6 Nov 1987). In *Fifth Australian conference on nuclear techniques of analysis : proceedings.* Order Number DE89632463/JAW. Available from NTIS (US Sales Only), PC A12/MF A01 - OSTI; INIS.

Uranium concentration and distribution and actinide mobility within two granitoid bodies in Australia have been investigated using electron microprobe analysis, and fission-track and alpha track micromapping to evaluate individual minerals as natural analogues of radionuclide mobility within large granitoid bodies to assist in the assessment of their suitability as disposal media for high-level nuclear waste. Fission-track micromapping and electron microprobe element mapping shows that uranium is unevenly distributed between three mineralogical locales, and is redistributed during further alteration of secondary and interstitial minerals, implying the dominant mechanisms for fixation are adsorption and ionic exchange. Further evidence of mechanisms is provided by the preferential concentration of alpha activity from a Pu-doped solution by secondary and interstitial minerals which thus assist in limiting radionuclide migration through a potential repository rock. Hydrothermal alteration may therefore be considered a desirable characteristic for potential granitoid disposal media for high-level nuclear waste.

43444 (INIS-mf–11495, pp. 163-165) **Assessment of techniques for determining accessible uranium in geologic material.** Payne, T. (Australian Nuclear Science and Technology Organisation, Lucas Heights (Australia)). Australian Inst. of Nuclear Science and Engineering, Lucas Heights (Australia). Nov 1987. (CONF-8711312–: 5. Australian conference on nuclear techniques of analysis, 4-6 Nov 1987). In *Fifth Australian conference on nuclear techniques of analysis : proceedings.* Order Number DE89632463/JAW. Available from NTIS (US Sales Only), PC A12/MF A01 - OSTI; INIS.

Two techniques for determining accessible natural uranium in geologic samples are compared. The first involves equilibrating the solid with a simulated natural groundwater to which ^{236}U has been added and measuring the level of uranium isotopes in the aqueous phase at equilibrium. The amount of accessible uranium is inferred from the relative levels of ^{236}U and ^{238}U in solution. In the alternative technique, the sample is extracted with a reagent chosen to remove accessible uranium. The success of this method is dependent on the selection of an appropriate extractant.

43445 (INIS-mf–11495, pp. 157-159) **Measurement of uranium series nuclides in rock bordering a fracture.** Nightingale, T.J. (Australian Nuclear Science and Technology Organisation, Lucas Heights (Australia)). Australian Inst. of Nuclear Science and Engineering, Lucas Heights (Australia). Nov 1987. (CONF-8711312–: 5. Australian conference on nuclear techniques of analysis, 4-6 Nov 1987). In *Fifth Australian conference on nuclear techniques of analysis : proceedings.* Order Number DE89632463/JAW. Available from NTIS (US Sales Only), PC A12/MF A01 - OSTI; INIS.

Alpha spectrometry was used to measure the $^{234}U/^{238}U$ and $^{230}Th/^{234}U$ activity ratios in crushed, thinly-cut sections of rock running parallel to a major fracture, as well as in the fracture-filling material. In addition, gamma spectrometry was used to measure the level of ^{226}Ra in each sample, enabling the $^{226}Ra/^{230}Th$ activity ratios to be estimated. The results show the highest concentration of uranium to be in the fracture, while the influence of groundwater on the surrounding rock could be seen by sharp variations in activity ratios within a few centimetres of the fracture. The use of a mild leaching reagent showed ^{234}U to be located in more potentially mobile sites than ^{238}U. The experiment provides a basis for further study of the role of fractures in crystalline rock in promoting the transport of uranium series nuclides. Fractures are considered to be a potential source of mobilisation of radionuclides from a deep radioactive waste repository, so data of the sort described here are considered useful for validation of radionuclide transport models.

43446 (KFK–4517) **The transfer of iodine-127 from fodder to cow's milk.** Neck, C. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Chemie. May 1989. 94p. (In German). Order Number DE89796043/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

The transfer factor of iodine from fodder to cow's milk was estimated by means of measuring the concentration of iodine-127 in samples of fodder and milk. The method of determination: 1. Sample preparation, freeze-drying, homogenization, preparation of pellets; 2. Combustion of the organic material in an 'oxygen combustion bomb' and absorption of the liberated iodine in Na_2CO_3-solution. 3. Inversvoltammetric determination of iodide in the Na_2CO_3-solution. All analyses were carried out with the addition of I-123 as radioactive tracer for the chemical yield. The transfer factor, calculated from the results of these determinations is, assuming a medium daily fodder reception of 55 kg/d: $1.25x10^{-2}$ +/- $1.2x10^{-2}$ d/L. Assuming a daily fodder reception of 65 kg/d the transfer factor is: $1.1x10^{-2}$ +/- $1.0x10^{-2}$ d/L. The large error is caused by the wide variation of the iodine content of fodder and milk during the green fodder period. The error due to the standard deviation of the analytical procedure is only 40%. (orig./HP).

43447 (NIRS-RSD–82) **Radioactivity survey data in Japan, part 1. Environmental materials.** National Inst. of Radiological Sciences, Chiba (Japan). Oct 1988. 28p. Order Number DE89906611/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The report presents data obtained through a radioactivity survey. Various environmental and dietary materials are collected for analysis. Rain and dry fallout are collected monthly. Airborne dust is collected every three months. Service water samples are taken semiyearly at the intake of watertreatment plants and at the tap. Freshwater is taken once a year (fishing season). Soil samples are collected once a year from two layers at different depths. Sea water is collected once a year at fixed stations where the effect of terrestrial fresh water from rivers is expected to be negligible. Sea sediments are collected once a year in the same area as that for the sea water sample. A full one day ordinary diet including three meals, water and tea for five persons is collected semiyearly as a sample of 'total diet'. Polished rice is collected in producing districts and in consuming areas. Raw milk is collected in producing districts and commercial milk is purchased in consuming districts. Vegetable are collected semiyearly in producing and consuming districts. Tea samples are also collected semiyearly. Fish, shellfish and seaweeds are collected once a year. Test solutions are prepared from these samples. Strontium-90 and cesium-137 are separated and subjected to quantitative determination. Results obtained are tabulated. (N.K.).

43448 (NRCN(LS)–021) **Movement of tritium in ecological systems.** Polevoy, Y; Laichter, Y. Israel Atomic Energy Commission, Beersheba (Israel). Nuclear Research Center-Negev. Nov 1988. 44p. (In Hebrew). Order Number DE89632926/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This literature survey summarizes the interaction of tritium gas and tritiated water with various components of the ecological system. The intake of tritium gas and tritiated water in plants and soil is described as well as the location of the highest measurable concentration. This information may serve as a basis for risk assessment from tritium to man through the food chain and enables effective tracing of its concentration in the environment. (author). 30 refs.; 10 figs.; 17 tables.

43449 (NSS/R–121) **Sorption of radionuclides on geological samples from the Bradwell, Elstow, Fulbeck and Killingholme site investigations.** Berry, J.A.; Coates, H.A.; Green, A.; Littleboy, A.K. United Kingdom Nirex, Ltd., Harwell (UK). Jun 1988. 20p. (AERE-R–13025). Order Number DE89635086/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The sorption of chloride, caesium, calcium, nickel and americium on geological samples collected during the site investigations at Bradwell, Elstow, Fulbeck and Killingholme has been studied. Through-diffusion and batch sorption techniques were used and experiments were designed to give a direct comparison between the sorptive behaviour of material from each site. (author).

43450 (ORF–P-5340/FG) **Development and evaluation of soil gas sampling techniques.** Piersol, P.; Fugler, D. Ontario Research Foundation, Sheridan Park, ON (Canada). 1987. 92p. (CE–02710). Available from Canada Mortgage and Housing Corporation, Annex Bldg., 628 Montreal Rd., Ottawa, ON, CAN K1A 0P7; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

As a consequence of the investigations on indoor radon, air infiltration and moisture in residential buildings, it has been determined that there may be a potential for significant entry of soil gas into basements or crawlspaces. This soil gas may also have the potential of containing various contaminants such as radon, methane, and other organic compounds and fungi which may have an adverse effect on indoor air quality. This report describes the development and evaluation of soil gas sampling techniques that would be suitable for a wide soil gas entry survey of Canadian housing. Two types of soil gas sampling devices were fabricated and tested. Three residences were selected for field evaluations of the probes and containers; conditions at these residences represented a variety of soil geological and have construction characteristics. Soil gas pressure profiles and the resulting soil gas flow patterns were found not to be uniform. The in situ pressures were higher than reported literature values by several orders of magnitude; this was due to the confined condition of the soil. Active sampling of organic constituents from the probes located above the water table and from the entry point containers was successfully conducted. The low level of soil gas constituents found at the three test homes made evaluation of the sampling techniques and interpretation of the results difficult. The tests for organic compounds, pesticides and fungal growth were at or below the analytical detection limits. However, radon levels were consistently measurable. Based on the ratio of radon concentrations, for the 3 homes investigated the soil gas entry was 1.1% to 3.8% of the entire home air infiltration. 33 refs., 14 figs., 8 tabs.

43451 (ORNL/RASA–88/41) **Results of the radiological survey at 17 Redstone Lane, Lodi, New Jersey (LJ030).** Foley, R.D.; Floyd, L.M.; Carrier, R.F.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Jun 1989. 15p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89015403/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New Jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1916 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. Area residents used the sandlike waste from this thorium extraction process mixed with tea and cocoa leaves as mulch in their yards. Some of these contaminated wastes were also eroded from the site into Lodi Brook. At the request of the US Department of Energy (DOE), a group from Oak Ridge National Laboratory conducts investigative radiological surveys of properties in the vicinity of MCW to determine whether a property is contaminated with radioactive residues, principally ^{232}Th, derived from the MCW site. The survey typically includes direct measurement of gamma radiation levels and soil sampling for radionuclide analyses. The survey of this site, 17 Redstone Lane, Lodi, New Jersey (LJ030), was conducted during 1985 and 1986. Results of the survey demonstrated radionuclide concentrations in excess of the DOE Formerly Utilized Sites Remedial Action Program criteria. The radionuclide distributions are typical of the type of material originating from the MCW site. 4 refs., 7 figs., 3 tabs.

43452 (ORNL/RASA–88/42) **Results of the radiological survey at 10 Hancock Street, Lodi, New Jersey (LJ031).** Foley, R.D.; Floyd, L.M.; Carrier, R.F.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Jun 1989. 11p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89015404/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New Jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1916 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. Area residents used the sandlike waste from this thorium extraction process mixed with tea and cocoa leaves as mulch in their yards. The survey typically includes direct measurement of gamma radiation levels and soil sampling from radionuclide analyses. The survey of this site, 10 Hancock Street, Lodi, New Jersey (LJ031), was conducted during 1985 and 1986. Results of the survey demonstrated radionuclide concentrations in excess of the DOE Formerly Utilized Sites Remedial Action Program criteria. The radionuclide distributions are typical of the type of material originating from the MCW site. 4 refs., 4 figs., 3 tabs.

43453 (ORNL/RASA–88/44) **Results of the radiological survey at 2 Branca Court, Lodi, New Jersey (LJ036).** Foley, R.D.; Floyd, L.M.; Carrier, R.F.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Jun 1989. 13p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89015405/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New Jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1961 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. Area residents used the sandlike waste from this thorium extraction process mixed with tea and cocoa leaves as mulch in their yards. Some of these contaminated wastes were also eroded from the site into Lodi Brook. At the request of the US Department of Energy (DOE), a group from Oak Ridge National Laboratory conducts investigative radiological surveys of properties in the vicinity of MCW to determine whether a property is contaminated with radioactive residues, principally ^{232}Th, derived from the MCW site. The survey typically includes direct measurement of gamma radiation levels and soil sampling for radionuclide analyses. The survey of this site, 2 Branca Court, Lodi, New Jersey (LJ036), was conducted during 1985 and 1986. Results of the survey demonstrated radionuclide concentrations in excess of the DOE Formerly Utilized Sites Remedial Action Program criteria. The radionuclide distributions are typical of the type of material originating from the MCW site.

43454 (ORNL/RASA–88/52) **Results of the radiological survey at 4 Branca Court, Lodi, New Jersey (LJ037).** Foley, R.D.; Floyd, L.M.; Carrier, R.R.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Jun 1989. 20p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89015402/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Maywood Chemical Works (MCW) of Maywood, New Jersey, generated process wastes and residues associated with the production and refining of thorium and thorium compounds from monazite ores from 1916 to 1956. MCW supplied rare earth metals and thorium compounds to the Atomic Energy Commission and various other government agencies from the late 1940s to the mid-1950s. Area residents used the sandlike waste from this thorium extraction process mixed with tea and cocoa leaves as mulch in their yards. Some of these contaminated wastes were also eroded from the site into Lodi Brook. At the request of the US Department of Energy (DOE), a group from Oak Ridge National Laboratory conducts investigative radiological surveys of properties in the vicinity of MCW

to determine whether a property is contaminated with radioactive residues, principally ^{232}Th, derived from the MCW site. The survey typically includes direct measurement of gamma radiation levels and soil sampling for radionuclide analyses. The survey of this site, 4 Branca Court, Lodi, New Jersey (LJ037), was conducted during 1985 and 1986. Results of the survey demonstrated no radionuclide concentrations in excess of the DOE Formerly Utilized Sites Remedial Action Program criteria. However, this property is apparently located directly over the old Lodi Brook streambed. This factor in combination with the elevated gamma logs of several auger holes is sufficient to recommend this site for inclusion in the DOE remedial action program. 5 refs., 5 figs., 4 tabs.

43455 (ORNL/RASA–88/53) **Results of the radiological survey at 6 Hancock Street, Lodi, New Jersey (LJ033).** Foley, R.D.; Floyd, L.M.; Carrier, R.F.; Crutcher, J.W. Oak Ridge National Lab., TN (USA). Jun 1989. 28p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC05-84OR21400. Order Number DE89015406/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Several sites have recently been discovered to be contaminated with considerable quantities of tar. The tar is located in damaged underground tanks, abandoned dumps and even in river bottoms. It presents a difficult problem since it often contains important quantities of compounds in the family of polyaromatic hydrocarbons some of which have a carcinogenic potential. Some case histories are presented outlining methods used for the handling, treatment, and destruction of these contaminants. The following processes are reviewed: solidification of the viscous semi-liquid tar, ultrasorption for the treatment of contaminated water, and biolysis for destruction of the organic contaminants and detoxification of the waste material. 4 refs., 6 tabs.

Also available from Supt. of Docs.

Contents include: basic requirements for implementing biological systems to remediate hazardous wastes; initial data requirements; example site for bioremediation; reactor design; in-situ design.

43458 (PB–89-180053/XAB) **Air/Superfund national technical guidance study series, Volume 2. Estimation of baseline air emission at Superfund sites. Interim report(Final).** Radian Corp., Sacramento, CA (USA). Jan 1989. 246p. Available from NTIS, PC A11/MF A01.

This volume is one in a series of manuals prepared for EPA to assist its Remedial Project Managers in the assessment of the air contaminant pathway and developing input data for risk assessment. The manual provides guidance on developing baseline-emission estimates from hazardous waste sites. Baseline-emission estimates (BEEs) are defined as emission rates estimated for a site in its undisturbed state. Specifically, the manual is intended to: Present a protocol for selecting the appropriate level of effort to characterize baseline air emissions; Assist site managers in designing an approach for BEEs; Describe useful technologies for developing site-specific baseline emission estimates (BEEs); Help site managers select the appropriate technologies for generating site-specific BEEs.

43459 (PB–89-180061/XAB) **Air/Superfund national technical guidance study series, Volume 3. Estimation of air emissions from cleanup activities at Superfund sites. Interim report (Final).** Radian Corp., Austin, TX (USA). Jan 1989. 249p. Available from NTIS, PC A11/MF A01.

See also PB–89-180053.

This manual was developed concurrently with three related manuals that also address air issues arising from hazardous-waste sites. The overall goal of the program is to develop guidelines for predicting and/or measuring air emissions during remedial activities. For the preliminary version of the manual, the objectives were to: Present a protocol for estimating air emissions from remedial activities at NPL sites; Identify existing data gaps or limitations in the protocol; Provide guidance for collecting data to estimate or confirm air emissions. Field studies are scheduled to address one of the data gaps that has been identified. A revised version of the manual will be published subsequent to the research.

See also PB–88-173000.

The Minker/Stout/Romaine Creek (M/S/RC) site is located in the city of Imperial, Jefferson County, Missouri, 25 miles southwest of St. Louis. The site is an unincorporated, wooded residential area and is comprised of four noncontiguous areas: Minker, Stout, Cashel, and Sullins. It is within a distance of approximately 0.8 miles and includes the upper 6000 feet of Romaine Creek. Contamination at the site resulted from the use of dioxin-contaminated soil as fill material, and has spread as a result of erosion from these areas. Contaminated soil in all areas except the Stout area and Romaine Creek has been excavated and currently is stored in interim onsite storage. The total volume of contaminated soil at this site including the amount in temporary storage is estimated to be 12,000 cubic yards. The primary contaminant of concern affecting the soil at this site is 2,3,7,8-TCDD (dioxin).

43461 (PB–89-188718/XAB) **Superfund Record of Decision (EPA Region 7): John Deere DDubuque Works, Dubuque, Iowa (first remedial action), September 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1988. 50p. (EPA/ROD/R–07-88/021). Available from NTIS, PC A03/MF A01.

The John Deere Dubuque Works site is located approximately 2.5 miles north of the City of Dubuque, Iowa. The site is owned by Deere and Company, which has operated a manufacturing plant at the site since 1946. The plant property includes an area of 1,447 acres located in the flood plain at the confluence of the Little Maquoketa River and the Mississippi River. The waste-management history of the plant is complex, but the primary area of concern is an unlined landfill originally placed in a natural depression caused by the Little Maquoketa River. Prior to 1968, wastes were placed in the low areas of the landfill and combustible materials were burned. Another area of concern at the facility is the site of a 1980, 200,000-gallon diesel fuel spill. Investigations conducted by John Deere indicated that human health hazards at the landfill could be considered minimal with the primary hazard being the possibility of dissolved organic chemicals impacting offsite domestic wells located east of the plant along the Mississippi River. The primary contaminants of concern affecting the ground water are volatile organic compounds including benzene, PCE, TCE, and toluene. The selected remedial action for the site is included.

43462 (PB–89-188817/XAB) **Superfund Record of Decision (EPA Region 6): Koppers Texarkana Site, Texarkana, Texas (first remedial action), September 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 23 Sep 1988. 89p. (EPA/ROD/R–06-88/023). Available from NTIS, PC A05/MF A01.

Portions of this document are not fully legible.

The Koppers Texarkana site is located within the City of Texarkana, Texas. The site consists of a 34-acre residential area and a 28-acre former sand and gravel operation. The Koppers Company operated the site as a wood-preserving facility from 1910 to 1961 using pentachlorophenol (PCP), creosote, and metallic salts in the operation. The site is currently owned by Carver Terrace, Inc. The Texas Department of Water Resources became aware of the site in 1979 through the Ekhardt Survey. The remedial investigation indicated that the highest concentration of site contaminants in the soil were located near the operations and drip track areas of the old wood-preserving facility. The primary contaminants of concern affecting the soil, ground water, and sediments are volatile organic compounds including benzene, xylenes, and toluene, other organics including polynuclear aromatic hydrocarbons and PCP, and metals including arsenic. The selected remedial action for the site is included.

43463 (PB–89-189526/XAB) **Superfund Record of Decision (EPA Region 5): IMC East Plant, Terre Haute, Indiana site (IMC) (second remedial action), June 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. Jun 1988. 80p. (EPA/ROD/R–05-88/070). Available from NTIS, PC A05/MF A01.

The IMC/Terre Haute site is located in southeastern Terre Haute, Vigo County, Indiana. A waste-disposal area, encompassing approximately six acres, is located in the northeastern portion of the plant site. From 1946 to 1954 a small facility on a six-acre segment of the property manufactured, packaged, and warehoused technical-grade benzene hexachloride (BHC-tech). In 1980, approximately 28,500 cu yds of soil, rubble, piping and other debris were excavated and placed in a secure clay-capped mound to prevent offsite migration of BHC-tech. The cap system included a surface drainage collection system and soil-gas venting. The selected remedial action for this site is no further action with a maintenance program.

43464 (PB–89-190821/XAB) **Guide to treatment technologies for hazardous wastes at Superfund sites.** Environmental Protection Agency, Washington, DC (USA). Office of Environmental Engineering and Technology. Mar 1989. 31p. (EPA–540/2-89/052). Available from NTIS, PC A03/MF A01.

Also available from Supt. of Docs. See also PB–88-113360.

This guidebook addresses alternative technologies that can be used to treat wastes at Superfund sites. These treatment methods comprise the following five sections of the alternative technologies table: Biological treatment; Chemical treatment; Physical treatment; Stabilization, solidification, and encapsulation treatment; and Thermal treatment.

43465 (PB–89-861850/XAB) **Wetlands legislation and management. January 1977-January 1988 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-January 1988.** National Technical Information Service, Springfield, VA (USA). May 1989. 186p. Available from NTISPC N01/MF N01.

See also PB–89-861868.

This bibliography contains citations concerning Federal and state legislation governing coastal and fresh-water wetlands. Studies of regional regulations and management of specific cites are included. Reconciling environmental considerations with economic pressures and landowners' rights is discussed. Wetlands restoration projects, conservation projects, and development plans are presented. Many citations discuss wetlands management and law in relation to the Clean Water Act. (This updated bibliography contains 351 citations, none of which are new entries to the previous edition.)

43466 (PB–89-861868/XAB) **Wetlands legislation and management. February 1988-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for February 1988-May 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 41p. Available from NTISPC N01/MF N01.

Supersedes PB–88-857560. See also PB–89-861850.

This bibliography contains citations concerning Federal and state legislation governing coastal and fresh-water wetlands. Studies of regional regulations and management of specific cites are included. Reconciling environmental considerations with economic pressures and landowners' rights is discussed. Wetlands restoration projects, conservation projects, and development plans are presented. Many citations discuss wetlands management and law in relation to the Clean Water Act. 43467 (ACUNS–8701, pp. 50-74) **Marine processes.** Baker, J.M.; Angel, M.V. Association of Canadian Universities for Northern Studies (ACUNS), Ottawa, ON (Canada). 1987. (CONF-8508276–: Arctic heritage, Banff (Canada), 24-28 Aug 1985; MICROLOG–87-03004). In *Arctic heritage. Proceedings of a symposium.* Available from Association of Canadian Universities for Northern Studies, 130 Albert Street, Ottawa, ON, CAN K1P 5G4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Arctic Ocean is large Mediterranean-type sea 53% of which is occupied by water of shelf depth or less. Within this ocean are many potential hydrocarbon basins, and petroleum industry activity is developing rapidly. Risks of accidents due to environmental hazards are particularly high, and oil spills appear to be an immediate serious threat to Arctic ecosystems. This review of marine processes in the Arctic Ocean considers the possible effects of oil industry activities throughout. A discussion of the regional hydrography reveals relatively little exchange with other oceans, relatively little seasonal reduction in the area of pack ice, a major hydrographic influence of freshwater inputs, and that sea ice is the major hazard in oil drilling operations. Examination of sediment processes indicates interactions with various oil exploration activities, such as dredging and construction of artificial islands. The hydrology, low nutrient supply, stable density structure and inhibiton of wind mixing of surface layers all contribute to a relatively low nutrient content in the Arctic Ocean; this may be enriched locally by human activities such as dredging, sewage disposal, degradation of oil from spills, and spent drilling fluids. An important concern is whether the low nutrient levels are a limiting factor for natural degradation of spilt oil. In an analysis of Arctic energy flows, it is seen that food chains are short and simple, mean productivity and biomass are low, and there are large seasonal fluctuations. Effects of oil industry activity on these ecosystems are outlined, and pollutant effects, pathways and

sinks are discussed, with particular consideration to treatment of Arctic oil spills. Areas of needed research are proposed. 46 refs., 5 figs., 2 tabs.

43468 (AD-A-206295/8/XAB) **Species profiles: life histories and environmental requirements of coastal fishes and invertebrates (South Atlantic). Biological report.** Hales, L.S.; Avyle, M.J.V.D. Georgia Cooperative Fishery and Wildlife Research Unit, Athens, GA (USA). Jan 1989. 33p. Available from NTIS, PC A03/MF A01.

Species profiles are literature summaries of the life history, distribution, and environmental requirements of coastal fishes and invertebrates. Profiles are prepared to assist with environmental-impact assessment. The spot (Leiostomus xanthurus) is an abundant fish in coastal waters of the South Atlantic Region. It is important to commercial and recreational fisheries. In the South Atlantic Region, spot spawn offshore from October to March. The larvae are transported from the offshore spawning grounds to estuarine nursery areas. Juvenile spot initially congregate in shallow tidal creeks, but then disperse into deeper water as they get larger. Spot mature at 2-3 years of age. As larvae, spot feed on plankton, but switch to benthic invertebrates as juveniles and adults. Juvenile and adult spot are eaten by many other fishes. Tolerance to thermal shock and other environmental extremes varies with developmental stage. Alterations of the salinity or temperature regimes of an estuary may affect populations of spot; disturbances that affect the benthic community upon which spot feed may also affect spot abundance. Spot are not strong swimmers and may, therefore, suffer significant mortality due to intake structures at industrial or power generation plants.

43469 (EC/IWD-87-128) **Mean monthly runoff estimation at ungauged sites using the square grid technique.** Pol, R.A. Environment Canada, Ottawa, ON (Canada). Inland Waters Directorate. 1987. 82p. (MICROLOG-87-06107). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The square grid technique has been used in the past for assessing water resource potential as well as for planning hydrometric networks. The method can be extended to generate synthetic streamflow on ungauged streams. The technique was developed initially for obtaining co-ordinated maps of precipitation, evaporation and runoff on a long-term mean annual basis. The technique was extended to the estimation of the same hydrological elements on a monthly basis. This paper presents the application of the square grid technique to the estimation of mean monthly runoff in a pilot area in Nova Scotia. The pilot area chosen was the location of a proposed gas pipeline in anticipation of future data needs for ungauged locations along the proposed route. The square grid model is calibrated for eight hydrometric basins within the study area and verified and assessed on three gauged basins. This system can be used to store, process and retrieve information and may have numerous applications in the field of hydrology. The square grid computer program was purchased by the Water Resources Branch, Ottawa, and details needed to run the routines were not included. As part of this project it became necessary to expand on the consultant's documentation, hence, a section on program input files is included in the main test. 6 refs., 2 figs., 6 tabs.

43470 (OME/APIOS-1987) **Acid sensitivity of lakes in Ontario.** Ontario Ministry of the Environment, Toronto, ON (Canada). Acid Precipitation in Ontario Study. 1987. 26p. (In English and French). (MICROLOG-87-04680). Available from Ontario. Ministry of the Environment. A.P.I.O.S. Coordination Office, 40 St. Clair Avenue West, 7th Floor, Toronto, ON, CAN M4V 1M2; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Ontario Ministry of the Environment conducts surveys to determine the sensitivity of Ontario lakes to acidic precipitation. This report presents a summary of the latest results of this survey and includes information on 6,063 lakes throughout the province. Lakes are arranged alphabetically by county or district, and a sensitivity index on a scale of 1 to 5 is given for each lake sampled. A summary table shows that 25.4% of the lakes were found to be not sensitive to acidification, and a further 17% had low sensitivity. Four percent were classified as acidic and 15.4% as extremely sensitive. 1 tab.

43471 (PB-89-168793/XAB) **Population model for Alaska Peninsula sea otters. Final report.** Eberhardt, L.L.; Siniff, D.B. Minnesota Univ., Minneapolis, MN (USA). 31 Dec 1988. 106p. Available from NTIS, PC A06/MF A01.

This study was conducted to provide a basis for assessing risks of oil spills to sea otter populations along the Alaska Peninsula. The principal efforts were devoted to analyzing the available data on population dynamics. Curves characterizing survivorship and reproduction for sea otters were devised and fitted to several data sets. A detailed review was conducted of methods of assessing population dynamics data, and several new techniques (e.g., bootstrapping) were applied to available data. A simplified model for use with Alaska Peninsula sea otter populations was devised and implemented in a 'spreadsheet' format. Various aspects of model development and data on population size in Alaska Peninsula areas were reviewed.

43472 (PB-89-172654/XAB) **Southwest Florida shelf ecosystems study, 1987.** Environmental Science and Engineering, Inc., Gainesville, FL (USA). Jun 1987. 1846p. Available from NTIS, PC EE99/MF E99.

Set includes PB-89-172662 through PB-89-172696. See also PB-86-245768.

This set contains 4 volumes pertaining to the ecosystems of the southwest Florida shelf. It discusses the environmental study of the shelf, and the objective is to determine the potential impact of OCS oil and gas offshore activities on the aquatic system. Other individual documents are also available.

43473 (PB-89-172662/XAB) **Southwest Florida shelf ecosystems study, Volume 1: Executive summary.** Environmental Science and Engineering, Inc., Gainesville, FL (USA). Apr 1987. 77p. Available from NTIS, PC A05/MF A01.

See also Volume 2, PB-89-172670; Also available in set of 4 reports PC E99, PB-89-172654.

The 6-year Southwest Florida Shelf Ecosystems Program began in 1980 as an interdisciplinary study. The study area extends seaward from the west coast of Florida to the 200-meter isobath and from 27°N latitude southward to the Florida Keys and Dry Tortugas. The region includes Florida Bay but not other estuarine areas. This area contains numerous live-bottom habitats and associated communities in a complex, patchy matrix. Live-bottom areas are often separated by wide expanses of sand or mud bottom areas. This report concludes the 6-year Southwest Florida Shelf Ecosystems Program's environmental study. The ultimate objective of the program was to determine the potential impact of OCS oil and gas offshore activities on live-bottom habitats and communities, which are integral components of the southwest Florida shelf ecosystems.

43474 (PB-89-172670/XAB) **Southwest Florida shelf ecosystems study, Volume 2: data synthesis report.** Environmental Science and Engineering, Inc., Gainesville, FL (USA). Apr 1987. 372p. Available from NTIS, PC A16/MF A01.

See also Volume 1, PB-89-172662 and Volume 3 Part A, PB-89-172688; Also available in set of 4 reports PC E99, PB-89-172654.

The 6-year Southwest Florida Shelf Ecosystems Program began in 1980 as an interdisciplinary study. This report concludes the environmental study. The ultimate objective of the program was to determine the potential impact of OCS oil and gas offshore activities on live-bottom habitats and communities, which are integral components of the southwest Florida shelf ecosystems. Subsections provide a brief description of the study area and a brief history of the 6-year program. Subsequent sections of the report present Year 6 data collection and management methods, study area characterization, impact projections, conclusions, and references cited.

43475 (PB-89-172688/XAB) **Southwest Florida shelf ecosystems study, Volume 3: annotated bibliography. Part a (A-K).** Environmental Science and Engineering, Inc., Gainesville, FL (USA). Jun 1987. 677p. Available from NTIS, PC A99/MF E04.

See also Volume 2, PB-89-172670 and Volume 3, Part B, PB-89-172696.; Also available in set of 4 reports PC E99, PB-89-172654.

The objective of the Southwest Florida Shelf Ecosystems Study was to synthesize all field data (collected during the 5-year field study) and data from other sources in order to produce a concise, coherent description of the biota conditions and processes in the study area. The objective was to assure that all available data were identified and considered before final assessments were made, and that any differences or data gaps were identified before development plans were approved or finalized. The information-collection task of the Year 6 study was implemented to meet this final objective. The methods used in the information collection effort and a copy of the bibliography that resulted from this effort are presented in the volume (Part B). The synthesis methods and the results of the synthesis effort are described in Volumes I (Executive Summary) and II (Synthesis Report).

43476 (PB–89-172696/XAB) **Southwest Florida shelf ecosystems study, Volume 3: annotated bibliography. Part b (L-Z).** Environmental Science and Engineering, Inc., Gainesville, FL (USA). Jun 1987. 720p. Available from NTIS, PC A99/MF E04.

See also Volume 3 Part A, PB–89-172688; Also available in set of 4 reports PC E99, PB–89-172654.

The objective of the Southwest Florida Shelf Ecosystems Study was to synthesize all field data and data from other sources in order to produce a concise, coherent description of the biota conditions and processes in the study area. This information, although critical to the program, was somewhat limited in value to decision makers because of its sheer volume. Consequently, the objective of the Year 6 study was to summarize, interpret, and synthesize this large data set to provide detailed descriptions of the systems and processes on the Florida shelf, and use this information to assess potential impacts of offshore development that can be directly used for stipulations and guidelines for developing Florida's offshore resources. The information collection task of the Year 6 study was implemented to meet this final objective. The methods used in the information-collection effort and a copy of the bibliography that resulted from this effort are presented in the volume (Part A). The synthesis methods and the results of the synthesis effort are described in Volumes I (Executive Summary) and II (Synthesis Report).

43477 (SE/APC–39) **Sensitivity of Saskatchewan surface waters to acidic inputs.** Lechner, L.J.; Howard, G.L. Saskatchewan Environment, SK (Canada). Air Pollution Control Branch. 1987. 18p. (MICROLOG–87-02101). Available from Saskatchewan. Saskatchewan Environment & Public Safety, 3085 Albert St., Regina, SK, CAN S4S 0B1; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

An overview of the sensitivity of lakes in Saskatchewan to acidic deposition is presented, based upon criteria developed for alkalinity and calcium. Highly sensitive lakes are defined by the criteria as having an alkalinity value of less than 10 (mg/l) or a calcium value of less than 4 mg/l. Moderately sensitive lakes are defined as having an alkalinity value between 10 and 20 mg/l, or a calcium value between 4 and 8 mg/l. The lower of the median calcium or median alkalinity value is used to determine a lake's sensitivity classification. Using these criteria, it was determined that generally, lakes on the Precambrian Shield area of northern Saskatchewan are classified as being either moderately or highly sensitive. The rest of Saskatchewan is well buffered against acid rain effects. 8 refs., 5 tabs.

43478 (AD-A–205290/0/XAB) **Sampling, testing, and test interpretation of dredged material proposed for unconfined, open-water disposal in Central Puget Sound. Volume 5. Evaluation procedures technical appendix. Phase 1. Final report.** Phillips, K.; Jamison, D.; Malek, J.; Ross, B.; Krueger, C. Evaluation Procedures Work Group, Seattle, WA (USA). Jun 1988. 487p. Available from NTIS, PC A21/MF A01.

This final environmental impact statement evaluates alternatives considered in identifying preferred sites for disposal of dredged material in Central Puget Sound. Three public multi-user disposal sites (Commencement Bay, Elliott Bay, and Port Gardner) are indentified for use based on a site-selection process that considered several alternative sites. Alternative biological-effects conditions for site management were considered and a site condition identified for purposes of dredged material management at the Phase I sites.

43479 (AD-A–206274/3/XAB) **Preliminary assessment/site investigation: Tooele Army Depot, Utah. Volume 1. North Area and facilities at Hill Air Force Base. Final technical report, 1 September 1985-1 November 1987.** Lapins, A.; McConnell, L.; Porter, T. EA Engineering, Science, and Technology, Inc., Sparks, MD (USA). 12 Dec 1988. 208p. (AE-TLA–51E5-VOL-1). Available from NTIS, PC A10/MF A01.

See also Volume 1, Appendixes, AD-A206 275.

This report documents the Preliminary Assessment/Site Investigation (PA/SI) phase of the U.S. Army Installation Restoration Program for the North Area of Tooele Army Depot (N-TEAD), Utah. The PA/SI for N-TEAD involved the performance of a records search and the development and implementation of a field-sampling and analysis program. The objectives of the PA/SI were to: (1) identify sites at N-TEAD used to store, process, and/or dispose of hazardous waste; (2) determine which of these sites have a low potential for environmental contamination and/or pose no immediate apparent threat to public health and welfare; (3) determine which sites have a high potential for environmental contamination and/or pose a threat to public health and welfare; (4) perform limited sampling of soil, ground water, and/or surface water to determine existence of contamination, if any, and to evaluate potential for offsite migration; and (5) identify off-post sites that may be impacting the environment of N-TEAD.

43480 (AD-A–206275/0/XAB) **Preliminary assessment/site investigation: Tooele Army Depot, Utah. Volume 1. North Area and facilities at Hill Air Force Base. Appendixes. Final report.** EA Engineering, Science, and Technology, Inc., Sparks, MD (USA). Dec 1988. 219p. (EA-THA–51E5-VOL-1-APP). Available from NTIS, PC A10/MF A01.

See also Volume 2, AD-A206 276.

Results are presented of analysis of two water samples from Tooele Army Depot. The samples were received January 18, 1986. Table 1 contains the results for the samples as well as the method blank and three control spikes analyzed with the lot. Table 2 contains data that will be needed to enter the results into the USATHAMA data-management system. All parameters analyzed for Tooele and Lake City are listed in Table 2, so some parameters may be listed that were not required on the samples. Copies of all control charts for the analyses performed are enclosed as well as comments from review of the charts.

43481 (AD-A–206277/6/XAB) **Preliminary assessment/site investigation, Tooele Army Depot, Utah. Volume 2. South Area. Appendixes. Final report.** EA Engineering, Science, and Technology, Inc., Sparks, MD (USA). Dec 1988. 125p. (EA-THA–51E5-VOL-2-APP). Available from NTIS, PC A06/MF A01.

43482 (AD-A–206661/1/XAB) **Long-term effects of dredging operations program: preliminary recommendations for a congener-specific PCB (polychlorinated biphenyl) analysis in regulatory evaluation of dredged material. Final report.** Clarke, J.U.; McFarland, V.A.; Pierce, B.D. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. Feb

1989. 41p. (WES/MP/D–89-2). Available from NTIS, PC A03/MF A01.

A preliminary recommendation of priority polychlorinated biphenyl (PCB) congeners for congener-specific analysis is offered for use in the regulatory evaluation of dredged material. Potential toxicity, environmental prevalence, and relative abundance in animal tissues are the criteria used in the selection of specific congeners and their assignment to four priority groups. Potential toxicity is equated to mammalian microsomal mixed-function oxidase (MFO) induction activity and type. MC- (3-methylcholanthrene-)-type and mixed-type induction activities are considered potentially most toxic, followed by PB- (phenobarbital-) type induction activity. Weak inducers and non-inducing congeners have the least potential for toxicity. Environmental prevalence, i.e., frequency of occurrence of specific congeners in environmental samples, is determined from the literature. Relative abundances of congeners (percents of total PCB as the sum of all congener concentrations) in tissues are reported or calculated from data in the literature, along with data generated from an experiment conducted at the US Army Engineer Waterways Experiment Station.

43483 (AD-A–206957/3/XAB) **Evaluation of dredged material disposal alternatives for US Navy homeport at Everett, Washington. Final report.** Palermo, M.R.; Shafer, R.A.; Brannon, J.M.; Myers, T.E.; Truitt, C.L. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. Jan 1989. 354p. (WES/TR/EL–89-1). Available from NTIS, PC A16/MF A01.

The US Navy has proposed to homeport a carrier battle group at Everett, Wash. Development of the homeport will involve dredging and disposal of approximately 1 million cu yd of contaminated native material. The US Army Engineer District, Seattle, is providing technical assistance in developing a dredging and disposal plan for these sediments from the East Waterway. In addition, the Seattle District is a permitting agency under Section 10 of the River and Harbor Act of 1899 and Section 404 of the Clean Water Act. The purpose of the WES studies was to evaluate the feasibility of alternatives from an environmental and related engineering standpoint. Three major disposal alternatives were evaluated for disposal of the contaminated sediment: confined upland, confined nearshore, and contained aquatic disposal (CAD). The Navy identified CAD as a preferred alternative during the course of the WES study, and also as the selected alternative in all applications for a Section 404 permit.

43484 (AD-A–207045/6/XAB) **New Bedford Harbor Superfund Project, Acushnet River Estuary engineering feasibility study of dredging and dredged-material disposal alternatives. Report 3. Characterization and elutriate testing of Acushnet River Estuary sediment. Technical report, August 1985-March 1988.** Averett, D.E. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. Mar 1989. 54p. (WES/TR/EL–88-15-3). Available from NTIS, PC A04/MF A01.

See also Report 4 dated Jan 88, AD-A200 462.

Several of the alternatives being considered for the New Bedford Harbor Superfund Project involve dredging of contaminated sediment from the Acushnet River Estuary and placement of the contaminated dredged material in confined disposal areas. Evaluation of these alternatives requires testing sediment from the site to determine chemical and physical characteristics, settling properties, contaminant releases for various migration pathways, and treatment requirements for disposal area effluent. The purpose of this report is to describe the estuary composite sediment sample and the hot-spot-sediment sample tested at the US Army Engineer Waterways Experiment Station as part of the US Army Corps of Engineers' Acushnet River Estuary Engineering Feasibility Study of Dredging and Dredged Material Disposal Alternatives. Bulk sediment chemistry, physical characteristics, and elutriate testing for the sediments are included.

43485 (CPS–8702, pp. 201-221) **Development and demonstration of a mobile reverse osmosis/adsorption treatment system for environmental clean-ups.** Donison, H. (ZENON Environmental Inc., Burlington, ON, Canada); Whittaker, H.; Tremblay, J.; Dutton, R. Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A system for treatment of organically contaminated waters resulting from chemical spills or landfill leachates was develped and demonstrated. The treatment system consists of two primary unit operations. The organically contaminated water is processed by reverse osmosis to produce a clean stream for discharge and a stream for further processing in which the organic contaminants have been concentrated up to ten times the original concentration. The concentrated stream suitable for discharge. The ultimate result of treatment is that the contaminated water can be treated on-site to produce a dischargeable effluent and the organic contaminants can be removed from the site adsorbed on a relatively small amount of carbon for incineration or disposal at a secure landfill. The system was demonstrated for 60 days at two contaminated sites. At one site the system was used to treat water drained from areas where petroleum products had been spilled over a number of years. At the second site, leachate from a hazardous waste landfill containing a number of chlorinated and nonchlorinated solvents was treated. The results of the demonstrations showed that between 50 and 95 % removal can be achieved for organic contaminants present in the feed at low ppM levels or less by this treatment system. 6 refs., 7 figs., 4 tabs.

43486 (CPS–8702, pp. 333-341) **A computer model system for CERCLA [Comprehensive Environmental Response, Compensation, and Liability Act] type A damage assessments.** Reed, M. (Applied Science Associates, Narraganseth, RI, USA); French, D.; Grigalunas, T.; Opaluch, J. Environment Canada, Ottawa, ON (Canada). Conservation and Protection. 1987. (CONF-870295–: Technical seminar on chemical spills, Toronto (Canada), 9-12 Feb 1987; MICROLOG–87-01873). In *Proceedings [of the] 4th technical seminar on chemical spills.* Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

A coupled marine transport/biological injury/economic damages model system has been developed to serve as the proposed basis for type A (small scale) damage assessments under the 1980 comprehensive Environmental Response, Compensaton, and Liability Act (CERCLA). The model, which operates on a personal computer, relies on large chemical and biological data bases for fundamental parameters. Spilled material concentrations are computed dynamically on the water surface, in the upper and lower water column, and in the sediments. Biological losses due to direct toxic effects on adults, and future catch reductions due to losses of larvae and juveniles, are calculated for commercially important species. Losses resulting from primary and secondary productivity are included through a simple fractional rule for energy transfer efficiency up the food chain. 1 ref., 3 figs., 1 tab.

43487 (EC/WQB–87-121) **An assessment of LRTAP acidification of surface waters in Atlantic Canada.** Howell, G.D.; Brooksbank, P. Environment Canada, Ottawa, ON (Canada). Water Quality Branch. [1989]. 313p. (MICROLOG–87-02938). Available from Water Quality Branch, Inland Waters Directorate, ATT: John Temple, Place Vincent Massey, 351 St. Joseph Blvd., Ottawa, ON, CAN K1A 0E7;MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report analyses lake and river water quality data from Atlantic Canada in an attempt to provide a regional overview of the terrain sensitivity and the extent of long-range transport of atmospheric pollutant (LRTAP) induced acidification. Southwestern Nova Scotia, northern Cape Breton Island and the west and south coast of Newfoundland have been identified as the areas which are the most sensitive to acidification. Surface waters in these areas show signs of acidification resulting from the combined effects of acid loadings from natural (i.e. organic acids) and anthropogenic (LRTAP) sources. Lake sulphate concentrations generally reflect the west to east deposition gradient with the highest values observed in New Brunswick and southwestern Nova Scotia. The most extreme

acidification has occurred in Nova Scotia, with many of the hydrometric basins having lost on average more than 80 percent of the pre-acidification alkalinity. This is reflected in the pH data with 45% and 15% of the Nova Scotia lakes having values below 5.3 and 5.0 respectively. Analysis of temporal changes indicated that pH values in Nova Scotia and Newfoundland rivers were significantly lower during the late 1960's and early 1970's while hydrogen ion exports peaked in 1973. This pattern agrees with the temporal pattern observed for the sulfur emissions in both the USA and eastern Canada. 58 refs., 97 figs., 18tabs.

43488 (EPRI-EN–6405) **Estimates of macrodispersivity based on analyses of hydraulic conductivity variability at the MADE [Microdispersion Experiment] site: Interim report.** Waldrop, W.R. Electric Power Research Inst., Palo Alto, CA (USA); Tennessee Valley Authority, Norris, TN (USA). Engineering Lab.; Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Civil Engineering. c Jul 1989. 164p. Sponsored by Electric Power Research Institute. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

At the site of an ongoing large-scale tracer experiment on the Columbus Air Force Base (CAFB), Mississippi, the feasibility of estimating the autocovariance parameters of log conductivity from variability measurements and of predicting the asymptotic macrodispersivities using recent stochastic theories is demonstrated. Extensive measurements of the hydraulic conductivity (K) in three dimensions, obtained using a borehole flowmeter method, were analyzed in detail to estimate the parameters of the lnK covariance. Special emphasis was placed on estimating the uncertainty in the parameter values due to finite data sets, measurement errors, and nonstationarity. A pragmatic methodology was developed based on the uncertainty in covariance parameter estimates and observed site characteristics to assess whether the random field contains a trend and how to decide on the appropriate level of detrending. The uncertainty in the parameter estimates yields a range of parameter values that encompassed the case of a second order trend removed by ordinary least squares methods, which was analyzed for the effects of correlated residuals and variogram bias. Covariance parameter estimates from preliminary analyses of secondary measurements such as surface geophysical surveys, grain size data, and large-scale aquifer tests were generally within the uncertainty from the extensive measurements suggesting the possibility that the covariance parameters can be estimated without exhaustive sampling. Most likely and bounding values of the covariance parameter were used to predict a range of macrodispersivities. A comparison of the predicted macrodispersivities to the measured values from the ongoing large- scale tracer experiment at CAFB cannot be made until the tracer test is complete. 76 refs., 40 figs., 19 tabs.

43489 (ETDE-mf–9911036) **Studies on the influence of foreign ions on the calcium carbonate precipitation under conditions of water heating. Final report.** Hoelzel, G. Fachhochschule Braunschweig-Wolfenbuettel, Wolfenbuettel (Germany, F.R.). Fachbereich Versorgungstechnik; Bundesministerium fuer Forschung und Technologie, Bonn (Germany, F.R.). Dec 1988. 157p. (In German). Contract BMFT 02-WT85465. Order Number DE89911036/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; NTIS (US Sales Only), PC A08/MF A01.

Measuring was necessary to determine the hitherto inadequately known solubility product of calcium carbonate in the temperature range between 10^0C and 80^0C in the presence of foreign ions; this was done to make exact predictions about the calcium carbonate precipitation during the process of water heating. The results showed that the approach of Plummer and Busenberg covers the solubility equilibrium over the complete temperature range from 10^0C and 80^0C, if, following a proposal by Eberle, complex ions are taken into consideration. In order to make quantitative predictions over a maximum calcium carbonate precipitation possible, a calcium carbonate precipitation potential was defined. (orig.) With 28 refs., 8 tabs., 10 figs.

43490 (GKSS–88/E/70) **Influence of suspended particulate matter regime on the heavy metal pollution of the tidal river Elbe at Hamburg.** Irmer, U.; Knauth, H.D.; Weiler, K. GKSS-Forschungszentrum Geesthacht G.m.b.H., Geesthacht-Tesperhude (Germany, F.R.). 1988. 7p. (In German). Available from Special print from Z. Wasser Abwasser Forsch. (1988) v. 21 p. 236-240.

In monitoring programmes heavy metal contents of flowing water usually are determined as total concentrations. Particularly in tidal rivers characterized by conspicuous changes of suspended particulate matter (SPM) contents, an assessment of the pollution of different areas and in time series could only be achieved by separate analysis of 'dissolved' and seston bounded heavy metal concentrations. As a result of the investigations, analysis of the heavy metal contents of SPM showed that tbe monitoring strategy used is suitable to prove the influence of SPM regime on the area and the time (saison) dependent specific variability of heavy metal pollution in the widely branched tidal river Elbe at Hamburg. (orig.).

43491 (OME/WRB–8704) **Contaminant concentrations in bottom sediments of the Sir Adam Beck power reservoir and Niagara River bar dredgeate.** Kauss, P.B.; Post, L.E. Ontario Ministry of the Environment, Toronto, ON (Canada). Water Resources Branch. 1987. 49p. (MICROLOG–87-06345). Available from Ontario Ministry of the Environment, Public Information Office, 135 St. Clair Ave. West, Toronto, ON, CAN M4V 1P5; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In November 1983, a survey was conducted to determine the concentration and distribution of contaminants in sediments of Ontario Hydro's Sir Adam Beck Power Reservoir and the concentration of contaminants in material commercially dredged from the Niagara Bar at the outlet of the Niagara River. Samples were analyzed for inorganics, solvent extractables (oils and greases), polychlorinated biphenyls (PCBs), organochlorine pesticides, nutrients, percent loss on ignition and sediment particle size distribution. Bottom sediments in the reservoir contained levels of certain metals at levels in excess of provincial guidelines. These findings suggest either relatively recent or ongoing upstream inputs of particulate-associated contaminants, since the latter were identified in surficial layers. Due to the nature of water withdrawals for hydropower generation, the contaminants probably originated mainly in the Chippawa Channel and reached the reservoir via the Chippawa-Grass Island Pool diversion. PCBs were also detected in 43% of the samples from the reservoir, but at levels close to the detection limit and below the disposal guideline. Samples from the Niagara Bar contained solvent extractables, nutrients, inorganics, and organochlorines at concentrations which were considerably below guidelines for open water dredge spoil disposal and, in most instances, lower than in fresh surficial sediments from the Bar. Since the latter contained some contaminants at levels above dredging guidelines (such as PCBs and Fe), there is a need to determine the impacts of possible particulate-associated contaminant losses during the dredging operation. Hexachlorobenzene was the only organochlorine compound detected in dredgeate samples. 24 refs 4 figs 8 tabs

43492 (PB–89-166607/XAB) **Assessment of the potential for transport of dioxins and codisposed materials to ground water. Report for 26 December 1986-25 January 1988.** Walters, R.W.; Yousefi, Z.; Tarleton, A.L.; Ostazeski, S.A.; Barry, D.C. Maryland Univ., College Park, MD (USA). Dept. of Civil Engineering. Mar 1989. 114p. Available from NTIS, PC A06/MF A01.

Dioxins are very toxic contaminants and warrant study under a variety of experimental conditions. Studies were performed to evaluate the mobility of several of the dioxins in both soil columns as well as in batch experiments. The studies showed that the amount of chlorination did not necessarily control the partitioning of the dioxins, as expected, but also suggested that the structure or location where the Cl ion was attached to the benzene ring modified the hydrophobicity of the compound. Studies were performed with a variety of cosolvents that might mediate the movement of the dioxin. The observed modification in mobility was consistent with existing theory for enhanced mobility with truly miscible solvents. Experimental data appear to show reversibility in the sorption process, but significantly limited by kinetics with 30 to 50 days required to release 50-90% of the contaminant.

43493 (PB–89-169791/XAB) **Numerical calculation of dispersion of constituents in estuaries and coastal seas.** van Stijn, T.L.; Praagman, N. Rijkswaterstaat, The Hague (Netherlands). Data

Processing Div. Feb 1988. 13p. (SWA–88/033). Available from NTIS, PC EE03/MF A01.

In the recent years the study of the environment has become increasingly important. This is a result of the present-day economic expansion, which brings about a tremendous pollution problem of ground and surface waters and of the atmosphere. It has become clear that it is a necessity to use adequate models in order to trace out the consequences of accidents in seas and in estuaries that lead to pollution of the waters. In this paper the authors discuss two numerical techniques that are particularly suited for the calculation of the transport of pollutants in realistic simulations. These methods are among the best in the resolution of sharp gradients on a relatively coarse grid, without generating significant negative concentrations. The outcome of a test with an exact solution are shown. Moreover, a result of a realistic application is given in the Dutch Keeten-Volkerak model by means of the operational WAQUA simulation model.

43494 (PB–89-171524/XAB) **Fiscal Year 1987 program report: Connecticut Institute of Water Resources.** Miller, D.R. Connecticut Univ., Storrs, CT (USA). Inst. of Water Resources. Oct 1988. 35p. Available from NTIS, PC A03/MF A01.

See also PB–88-161062.

Connecticut's Institute of Water Resources 1987-88 research and information transfer projects focused on water-quality management and protection, hydrologic cycle modeling, wetland restoration, acid precipitation, ground water, lake management, and water allocation. Funded research projects included: Design and testing of an interactive ground and surface-water hydrologic model (02); chemical and physical interactions of ground water organics and metals with soils (03); using scaled chrysophytes to infer changes in paleolimnological environments (04); evaluation of ground water flow using 'Down-Well/Down-Well' and 'Down-Well/Surface' resistivity techniques (05); and, design and testing of an improved method for electrochemical recovery of metals from waste water (06). Information-transfer conference topics included: wetlands and development compatibility issues, metal recovery from wastewater, lake management, aquifer protection, Geographical Information Service, and water allocation.

43495 (PB–89-175624/XAB) **Water-quality benefits from the Conservation Reserve Program.** Ribaudo, M.O. Economic Research Service, Washington, DC (USA). Resources and Technology Div. Feb 1989. 40p. (USDA/AER–606). Available from NTIS, PC A03/MF A01.

The Conservation Reserve Program, a land-retirement program designed to remove from production 40 to 45 million acres of highly erodible cropland, may generate an estimated $3.5 to $4 billion in water-quality benefits. Potential benefits include lower water-treatment costs, lower sediment removal costs, less flood damage, less damage to equipment that uses water, and increased recreational fishing. Benefits were estimated with a set of procedures that approximated the physical, chemical, biological, and economic links between soil erosion and water use.

43496 (PB–89-178578/XAB) **Light-sensitized decontamination of ground-water hazardous chemicals. Technical report (Final).** Larson, R.A.; Schlauch, M.B.; Ellis, D.D.; Marley, K.A.; Ju, H.L. Illinois Univ., Urbana, IL (USA). Environmental Research Labs. 1988. 30p. Available from NTIS, PC A03/MF A01.

The use of sunlight, oxygen, and dissolved organic compounds active as 'photosensitizers' (substances capable of absorbing sunlight and transforming it into chemically useful forms) is a promising treatment for contaminated waters. Light is absorbed by the sensitizing substance, raising it to a higher energy excited state. Reaction with the excited state substance converts molecular oxygen to a form much more reactive with dissolved compounds. Riboflavin (Vitamin B2), a naturally occurring compound and a known photosensitizer, was investigated for use in this process. A series of kinetic experiments explored its ability to photodegrade several aromatic compounds, phenols and anilines, that are related to some herbicides (such as carbaryl, 2, 4-D, alachlor, atrazine, and trifluralin) commonly found in polluted waters. It was found that riboflavin when added to solutions of phenols or anilines greatly accelerated the rate of their loss in the presence of light. The sensitized photolysis rates increased in the absence of oxygen, suggesting a mechanism involving direct energy or electron transfer between flavin excited states and acceptor molecules. In addition, it was found that some iron salts were very significant promoters of photodestruction of the triazine herbicide, atrazine.

43497 (PB–89-178602/XAB) **Novel two-stage three-phase fluidized-bed bioreactor with immobilized living cells for waste-water treatment application. Final report, September 1985-September 1988.** Fan, L.S. Ohio State Univ., Columbus, OH (USA). Dept. of Chemical Engineering. Oct 1988. 132p. Available from NTIS, PC A07/MF A01.

This research investigated the fundamental, practical design and operation of a novel two-stage three-phase fluidized-bed bioreactor for cost-effective waste-water treatment. Phenol biodegradation was selected as a model biodegradation system for the study. The fundamental studies included bubble wake structure and dynamics, solid mixing, gas-liquid mass transfer, biofilm characteristics, and biodegradation kinetics. Comprehensive mathematical models for steady state and dynamic phenol biodegradation in both draft tube and conventional three-phase fluidized bed bioreactors were developed and experimentally validated. These models provided guidelines for design, control and optimization of biodegradation, processes in three-phase fluidized bed bioreactors. The two-stage bioreactor was demonstrated to successfully integrate immobilization, biofilm development, biodegradation and biofilm control functions into one single unit with the least human intervention. The performance of the two-stage bioreactor in terms of biodegradation rate per unit solid loading was shown to be superior to that of a one-stage three-phase fluidized-bed bioreactor.

43498 (PB–89-180632/XAB) **National Benthic Surveillance Project: Pacific Coast, Part 1. Summary and overview of the results for cycles 1 to 3 (1984-86). Technical memo.** Varanasi, U.; Chan, S.L.; McCain, B.B.; Schiewe, M.H.; Clark, R.C. National Marine Fisheries Service, Seattle, WA (USA). Northwest and Alaska Fisheries Center. Dec 1988. 74p. (NOAA-TM-NMFS-F/NWC–156). Available from NTIS, PC A04/MF A01.

This report summarizes and interprets the results of the first 3 years of the Pacific Coast phase of the National Benthic Surveillance Project (NBSP), a component of NOAA's National Status and Trends Program. A comprehensive data base was developed, which includes detailed information on the distribution of a variety of chemical contaminants. These contaminants include selected aromatic hydrocarbons, PCBs, organochlorine insecticides and metals in surficial sediments and in liver tissue, bile, and stomach contents of selected bottom-feeding fish. The overall finding from the NBSP for the years 1984-86 indicated that the highest concentrations of most sediment-associated contaminants were present in the highly urbanized areas, and that contaminants were bioavailable to indigenous marine species.

43499 (PB–89-181945/XAB) **USEPA (United States Environmental Protection Agency) Method Study 38, SW-846, Method 3010: acid digestion of aqueous samples and extracts for total metals for analysis by flame atomic absorption spectroscopy. Final report, September 1986-February 1988.** Edgell, K.W.; Wilbers, D.M. Bionetics Corp., Cincinnati, OH (USA). Apr 1989. 178p. Available from NTIS, PC A09/MF A01.

An interlaboratory collaborative study was conducted to determine the mean recovery and precision for analyses of 21 trace metals in surface and waste waters. The study design was based upon Youden's non-replicate plan for collaborative tests of analytical methods. Four water matrices were spiked with 21 trace metals at six concentration levels, as three Youden pairs. Nine participating laboratories analyzed the four sample types using Method 3010. The primary objective was to use the USEPA computer program Interlaboratory Method Validation Study to measure recovery and precision for the 21 trace metals and compare the performance of the method across water types. Minimum detection limits (MDLs) were also compared. Comparison between samples, at the lowest metals concentration specified and another sample at 50% of those values, verified that the values specified in SW-846 are valid.

43500 (PB–89-183024/XAB) **Management functions for effective controls of ground-water contamination. Technical completion report.** Huang, J.Y.C. Wisconsin Univ., Madison, WI

(USA). Water Resources Center. 1988. 35p. (WIS-WRC–88-02). Available from NTIS, PC A03/MF A01.

Preventing ground-water pollution is the most desirable means of ensuring groundwater quality. The institutional framework of groundwater protection at the state and local levels of government was evaluated. Six southeastern Wisconsin counties were investigated through personal interviews with county health officials using a questionnaire designed to identify management practices, tools, and problems as well as local sources of ground-water pollution. Based on a nationwide assessment and responses to the county questionnaire, recommendations were made on an effective means of controlling ground-water contamination. The most difficult management problems were identified as political, indicative of the lack of local level government support of ground-water protection. Because government is responsive to public opinion, the lack of support is the result of a lack of public awareness. Thus, education should be an integral part of ground-water programs in order to gain support for protection efforts.

43501 (PB–89-183206/XAB) **Eutrophication and watershed study of Stoneville reservoir for the town of Auburn, Massachusetts. Final report.** Lycott Environmental Research, Inc., Southbridge, MA (USA). Jan 1981. 209p. Available from NTIS, PC A10/MF A01.

Outlines point-source pollution from Leicester liquid-waste disposal area that is degrading water-quality in Stoneville Reservoir, MA. Turbidity is the major water quality problem and is due to iron from a liquid waste site and landfill. Recommends settling pond to filter iron and manganese. The report was prepared in partial fulfillment of the requirements of an EPA Clean Lakes Program grant.

43502 (PB–89-191357/XAB) **Polluting incidents in and around US waters: calendar year, 1984, 1985 and 1986.** Coast Guard, Washington, DC (USA). Feb 1989. 91p. (USCG-COMDTINST-M–16450.2H). Available from NTIS, PC A05/MF A01.

Supersedes PB–87-186821.

This publication provides general information concerning pollution discharges into U.S. Navigable Waters for CY 1984 thru 1986. The data are presented in both tabular and graphic formats. The source of the data is the Pollution Incident Reporting System (PIRS), a computer-based system developed by the Coast Guard to support the Marine Environmental Response Program. PIRS contains data in addition to that published here.

43503 (PB–89-196679/XAB) **Superfund Record of Decision (EPA Region 9): Lorentz Barrel and Drum, San Jose, California (first remedial action), September 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 25 Sep 1988. 122p. (EPA/ROD/R–09-88/023). Available from NTIS, PC A06/MF A01.

The 5.4-acre Lorentz Barrel & Drum (LB and D) site is located in San Jose, California, about 0.25 mile from San Jose State University. The site lies directly above a major source of potable ground water in the south San Francisco Bay area, with three public water-supply-well fields within one mile of the site. In 1947 the Lorentz family began a drum-recycling operation on 10.5 acres of land at the site. Drums containing residual aqueous wastes, organic solvents, acids, oxidizers, caustic residues and oils were received for recycling. Sometime between 1968 and 1971 the discharge was diverted to a sanitary sewer, and investigations indicate that this discharge occurred until 1984. Since 1981 several investigations have revealed soil and ground water contaminated with numerous metals, organics, and PCBs. This remedial action will address the offsite contaminated shallow ground water. The selected Expedited Response Action for this site includes: onsite ground water pump and treatment using ozone/UV for organic removal and ion exchange for nickel removal, with discharge of treated water to a local creek.

43504 (PB–89-861892/XAB) **Waste-water treatment: lagoons. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 222p. Available from NTISPC N01/MF N01.

Supersedes PB–88-858626.

This bibliography contains citations concerning the treatment and storage of waste waters in lagoons. The design, operation, equipment, and pretreatment processes are discussed. The treatment of waste water from breweries, tanneries, paper mills, and other industrial operations are considered. Descriptions and evaluations of specific facilities are provided. (This updated bibliography contains 401 citations, 26 of which are new entries to the previous edition.)

43505 (PB–89-862916/XAB) **Waste water and water treatment: anion exchange. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 101p. Available from NTISPC N01/MF N01.

Supersedes PB–86-858297.

This bibliography contains citations concerning the theory, methods, and applications of anion exchange in the treatment of potable water and waste water. Topics include anion exchange resins and membranes, desalination techniques, and process evaluations. Methods for anion analysis using chromatographic techniques are also considered. (This updated bibliography contains 165 citations, 35 of which are new entries to the previous edition.)

43506 (AECL–9506) **HYDROS: a model of radionuclide migration in surface waters.** Wilkinson, S.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Oct 1987. 13p. Order Number DE89635118/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The submodel HYDROS has been developed for the safety assessment code COSMOS-S/D to represent radionuclide migration in surface waters. Model assumptions are generally conservative (i.e. pessimistic) in keeping with the safety assessment philosophy. Dilution is the dominant mechanism for reducing contaminant concentration. Actual removal of contaminant occurs through delay and decay, evaporation (if volatile), or sorption in lake sediment, the latter modelled as an irreversible process. The same system of equations applies equally to both river reaches and lakes, with the difference apparent only in the relative effects of dispersion and delay mechanisms for a given radionuclide. Experience since the original model was developed has led to simplification of input so that the submodel is easier to use.

43507 (AECL–9520) **Dispersion of contaminants in saturated porous media. Validation of numerical models.** Moltyaner, G.L.; Poisson, J.M. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Oct 1987. 68p. Order Number DE89635119/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

The main objective of this paper is to outline the experimental and theoretical investigations performed in an attempt to validate the applicability of finite element based numerical models for the prediction of the behaviour of a conservative tracer at the Twin Lake aquifer, Chalk River Nuclear Laboratories, Chalk River, Ontario. The essential point is that the 3/4 of a million data points obtained at the Twin Lake site from a 40 m natural gradient tracer test provide a unique opportunity for quantifying the system variability and for testing finite element models of the dispersion process. The subject of this discussion is the advection-dispersion model of contaminant transport - its equation and solution by the Galerkin finite element method. The report gives a brief description of the experimental data and the methods for the estimation of transport parameters. Scales of averaging associated with the conceptual formulation of the dispersion process, measurement of process variables, parameter estimation and the numerical models are discussed. The compatibility between the scales is emphasized as a major requirement for predictive modelling. The developed finite element model of the radioiodine transport describes the overall behaviour of the tracer plume but lacks the capability to simulate the fingerlike spreading of the plume due to the fact that the grid does not have

an adequately fine space discretization. Unfortunately, a refinement of the grid spacing is limited by the size of the site computer memory. For the advection-dominated transport, as that encountered at the Twin Lake aquifer, the failure to satisfy fine mesh requirement causes numerical dispersion. (Abstract Truncated)

43508 (AECL–9521) **Method of moments analysis of the Twin Lake tracer test data.** Moltyaner, G.L.; Wills, C.A. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Sep 1987. 72p. Order Number DE89635120/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

The two-dimensional transport of radioiodine at the Twin Lake aquifer at CRNL, is investigated at the full-aquifer-thickness scale using curve fitting procedures and the method of statistical moments. The observed concentration-time data were analysed using temporal moments and were converted to concentration-distance data sets. The converted data were then analysed using spatial moments and curve fitting procedures. It was concluded that over the 40 m flow path the areal two-dimensional model of mean concentration distribution does not adequately describe the essentially three-dimensional nature of the dispersion process probably because of the relatively short travel distances compared to the full-aquifer-thickness scale of description of the transport process (~ 10 m). Much larger travel distances are required before the effect of irregular flow geometry at this scale is smoothed out. Based on the previous analysis of the dispersion process at the macroscopic scale of descriptions of the transport processes it was concluded that the macroscopic scale characteristics, to a large extent, possess a universal character and the macroscopic-scale dispersion model adequately describes the field-scale dispersion process. 20 refs.

43509 (EC-SS–156) **Radionuclide content of some Canadian surface waters: a report on the National Radionuclides Monitoring Program, 1981 - 1984.** Baweja, A.S.; Joshi, S.R.; Demayo, A. Department of the Environment, Ottawa, ON (Canada). Inland Waters Branch. 1987. 25p. Order Number DE89635121/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Water samples were analyzed for total U, Ra-226, Cs-137, Sb-125 and tritium. Levels are generally low, and no time trends were discernible during the monitoring period. Temporal variations among the quarterly analyses are mostly insignificant. Except for total U at certain locations, all other radionuclide levels were much below the 'target concentration' guidelines for Canadian drinking water. The main contribution to the radiological dose commitment was from total U and Ra-226. Contributions from individual radionuclides to cumulative dose were in the order: total U > Ra-226 > tritium > Cs-137 > Sb-125. The limited sediment data suggest that the nuclear facilities along the Ottawa River have increased the levels of Cs-137 and Co-60 but have not affected those of Pb-210 and Ra-226. Total U and Ra-226 activities data suggest disequilibrium; the levels of total U in water were much higher than those of Ra-226. Concentrations of the two radionuclides, however, were positively correlated for most surface waters.

43510 (EPS–3/PG/1) **Radioactivity in coal, ashes and selected wastewaters from Canadian coal-fired steam electric generating stations.** Environment Canada, Ottawa, ON (Canada). Environmental Protection Service. Sep 1985. 131p. Order Number DE89635122/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Coal is known to contain naturally occurring radioactive elements and there has been speculation that as a results, coal-fuelled power generation stations may be significant emitters of these substances. In this report, the subject of radioactivity is introduced. The kinds of radioactive substances which occur naturally in coal formations, the nature of their emissions and the existing information on their behaviour and their effects on environmental organisms are also reviewed. The results of an examination of levels of alpha, beta and gamma radiaton levels, and the substances which produce them in coals, fly ashes, bottom ashes and related wastewaters at six Canadian coal-fuelled power stations are presented. Difficulties in studies of this nature and the potential effects of these releases on organisms in the adjacent aquatic environment are discussed. Existing and potential technologies for the removal of these substances from wastewaters are examined. In general the releases in wastewaters from the six stations were found to be lower than those known to cause short-term or acute biological effects. The potential for long-term effects from such low-level releases could not be accurately assessed because of the paucity of information. A number of recommendations for: improvements in further studies of this nature; the further examination of the fate of naturally occurring radionuclides in the environment; and the determination of the long-term effects of low levels of naturally occurring radioactive substances on aquatic organisms, are made.

43511 (GSF-Hy–2/88) **Annual report 1987 of the GSF Institute of Hydrology.** Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). Inst. fuer Hydrologie. Jun 1988. 288p. (In German). Order Number DE89911042/JAW. Available from NTIS (US Sales Only), PC A13/MF A01.

The first chapter presents the studies and results on the migration of pollutants, covering radionuclide behaviour (Cs-134, C-14) in deeper pore aquifers in the area of the Gorleben site for ultimate radwaste disposal and in the Asse salt dome area, the fate of the Chernobyl fallout in the soil, and nitrate in quarternary gravel deposits, as well as mathematical models of sorption and desorption processes. The second chapter reports on work in selected areas, covering hydrogeological, glacial hydrological and isotope hydrological studies in bore holes, receiving water courses, and the Asse salt deposit. The third chapter summarises the latest developments in terms of methods and instruments for isotope hydrology (He-3, He-4, C-14, Kr-85). (DG).

43512 (INIS-mf–11503, pp. 80) **Parametric studies of groundwater contamination models.** Reznik, L. (Israel Electric Corp. Ltd., Haifa (Israel). Dept. of Nuclear Engineering); Sharf, H.; Tepper, L. Israel Nuclear Society, Yavne (Israel). Mar 1989. (CONF-8903152–: Nuclear Societies of Israel annual meeting, Beer-Sheva (Israel), 13 Mar 1989). In *Annual Meeting 1989.* Order Number DE89012204/JAW. 43515 (PB–89-169890/XAB) **Uranium removal from drinking water using a small full-scale system.** Jelinek, R.T.; Clemmer, R.L.; Johns, F.J. Arber (Richard P.) Associates, Inc., Denver, CO (USA). Mar 1989. 47p. Available from NTIS, PC A03/MF A01.

This report presents background and history of water quality, the basis for design and nine months of actual operating data for a small, full-scale strong-base ion-exchange system that is used to remove uranium from a water supply serving a school in Jefferson County, CO. Information is also presented on the effectiveness of regeneration, the gamma-radiation profile of the system, and the capital and O/M costs of the system. Because of no on-site disposal system, the regeneration waste water is hauled away to a school district waste water treatment plant at a cost of $2.40 per 1,000 gallons of treated water.

43516 (PB–89-862643/XAB) **Radioactive pollution: ocean environments. January 1974-May 1989 (Citations from Oceanic Abstracts). Report for January 1974-May 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 60p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning radioactive pollution of the marine environment. Distributions of radionuclides indicative of artificial radioactive contamination are discussed including iodine-131, various uranium isotopes, cesium-137, cobalt-60, strontium-90, ruthenium-160, and plutonium isotopes. Ecosystems considered include coral reefs and atolls, planktonic zones in the open ocean, salt marshes, estuaries, coastal waters, and the Mediterranean Sea. Sources of radioactive contamination examined include atomic bomb blasts, fossil-fuel combustion, radioactive waste disposal, and nuclear accidents. Experimental simulation of radionuclide transport in marine biota is included. (Contains 108 citations fully indexed and including a title list.)

43517 (PB–89-178552/XAB) **Illinois self-help consortium for water and waste-water projects. Final report.** Levesque, C.W. Illinois Community Action Association, Springfield, IL (USA). Mar 1989. 55p. Available from NTIS, PC A04/MF A01.

This report documents the development and proposed implementation of an initial self-help project for water and waste water in Illinois. It describes the creation of a Self-Help Consortium composed of leading state agencies to test the application of self-help principles in developing water and wastewater systems in Illinois. The report includes a review of existing environmental programs with self-help components in other states, outlines self-help and its institutionalization within the New York State Self-Help Support System, proposes a similar structure for the delivery of self-help assistance in Illinois and identifies a set of Illinois, communities in which self-help might be tested. The report is recommended for individuals interested in both the concept of 'self-help' as well as the process by which program proposals are translated into extant initiatives.

43518 (PB–89-864730/XAB) **Water resources: effects of land use and urbanization. September 1981-June 1989 (Citations from the NTIS data base). Report for September 1981-June 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 98p. Available from NTISPC N01/MF N01.

Supersedes PB–88-864913.

This bibliography contains citations concerning the effects of land use and urban development on water-supply quality and quantity. Topics include appropriate local, state, and federal government policies, and utilization of mathematical models as predictive tools. Studies performed at specific localities are included if they provide comprehensive strategies that can be applied to other locations. (This updated bibliography contains 177 citations, 54 of which are new entries to the previous edition.)

5206 Regulations

Refer also to citation(s) 42222, 42367, 43457, 43460, 43461, 43462, 43463, 43465, 43466

43519 (CPS–4HA1) **Summary of environmental criteria for polychlorinated biphenyls (PCBs).** Environnement Canada, Ottawa, ON (Canada). Conservation et Protection. 1987. 50p. (In English and French). (MICROLOG–87-04943). Available from Environment Canada. Environmental Protection Publications, 10 Wellington St., 12th PVM, Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The tables in this report summarize the criteria for polychlorinated biphenyls (PCBs) in various environmental media. Information concerning such topics as regulations and guidelines for PCBs in the environment (air, water, soil, food, waste) has been gathered from the available literature, legislation, international agencies, federal government departments, provincial offices, and Environment Canada Regional Offices. Information was sought on existing guidelines and regulations, and on guidelines and criteria which were being considered, developed, or used as internal rules of thumb for management decision-making. Many of the provinces did not have their own specific guidelines, but had implemented, or were moving to implement federal guidelines and regulations. The information obtained is summarized in a table which also includes limited information from other countries for comparison. Rationales used in Canada and the USA to develop or arrive at some of the more important environmental guidelines, criteria, and tolerances, are also described. These rationales are discussed for guidelines relating to PCB concentrations in ambient air and water, drinking water, dredge spoil, food and occupational air. 51 refs 2 tabs

43520 (PB–89-167969/XAB) **Guidance document for providing alternate water supplies.** CDM Federal Programs Corp., Annandale, VA (USA). Feb 1988. 65p. Available from NTIS, PC A04/MF A01.

See also PB–85-238616.

This document serves as EPA guidance for providing information when it becomes necessary to develop or obtain alternate water supplies where releases of hazardous substances or pollutants have resulted in the closing of drinking water wells or has contaminated a principal drinking water supply. The information was prepared to assist Superfund contractors and on-scene Federal, State, and local officials with the planning and implementation of alternate water supplies at uncontrolled hazardous-waste sites. Guidance is specifically provided for those sites that do not require a time-critical removal action, but do require provision of an alternate water supply as either a non-time-critical removal actions of 6 months or more or a remedial action before implementation of a final remedy can be achieved (actions performed at National Priority List sites where short-term threats to the human population exist). These remedial actions are used to provide faster response than can be achieved with normal remedial actions. The decision-making process used in the document discusses the determination of water supply needs, screening and evaluating alternatives, and implementing the remedy.

43521 (PB–89-169197/XAB) **National Marine Pollution Program: federal plan for ocean pollution research, development, and monitoring, fiscal years 1988-1992.** National Ocean Pollution Program Office, Rockville, MD (USA). Sep 1988. 247p. Available from NTIS, PC A11/MF A01.

Also available from Supt. of Docs. See also PB–86-158813.

The National Marine Pollution Program is the composite of all programs funded by the Federal Government that conduct marine pollution research, development, or monitoring activities. In FY 1988, the Federal Government expended an estimated $107.2 million for marine pollution research and monitoring activities. These activities were funded by 11 Federal departments and independent agencies and included studies pertaining to pollution in coastal areas, estuaries, open oceans, and the Great Lakes. The Plan represents the fourth such document in the continuing interagency planning process called for in the National Ocean Pollution Planning Act of 1978 (P.L. 95-273), as amended. As required by the Act, a comprehensive 5-year Plan for the overall Federal effort is prepared and updated every 3 years. The Plan identifies national marine pollution needs and problems, describes the existing Federal capability for conducting marine pollution research and monitoring.

43522 (PB–89-169825/XAB) **Ambient water-quality criteria for 2,3,7,8-tetrachlorodibenzo-p-dioxin.** Stephen, C.E. Environmental Protection Agency, Washington, DC (USA). Office of Water Regulations and Standards. Feb 1984. 291p. (EPA–440/5-84/007). Available from NTIS, PC A13/MF A01.

Pursuant to Section 304(A)(1) of the Clean Water Act, this document was developed to publish criteria for water quality accurately reflecting the latest scientific knowledge. A summary of the criteria for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is as follows. Not

enough data are available concerning the effects of 2,3,7,8-TCDD on aquatic life and its uses to allow derivation of national criteria. For the maximum protection of human health from the potential carcinogenic effects due to exposure to 2,3,7,8-TCDD through ingestion of contaminated water and contaminated aquatic organisms, the ambient water concentration should be zero based on the non-threshold assumption for this chemical. However, zero level may not be attainable at the present time. Other concentrations representing different risk levels may be calculated. The risk estimate range is presented for information purposes and does not represent an Agency judgment on an 'acceptable' risk level.

43523 (PB–89-173751/XAB) **Developing a state wellhead protection program: a user's guide to assist state agencies under the Safe Drinking Water Act.** Roy, S. ICF, Inc., Fairfax, VA (USA). Jul 1988. 48p. Available from NTIS, PC A03/MF A01.

The 1986 Amendments to the Safe Drinking Water Act established a new Wellhead Protection (WHP) Program to protect ground water that supplies drinking water wells from sources of contamination. Under Section 1428 of the Act, each State must prepare a WHP program and submit it to EPA by June 19, 1989. Although the law requires that every State WHP program must contain specific elements, EPA recognizes that States should be allowed flexibility to tailor program details to best suit their individual needs. The document provides an overview of the major program requirements, presents major messages that a State should consider while developing a WHP program, and presents case-study examples to illustrate how a State might address each element of its WHP program.

43524 (PB–89-175475/XAB) **Survey of state ground-water-quality protection legislation enacted from 1985 through 1987.** National Conference of State Legislatures, Denver, CO (USA). Oct 1988. 108p. Available from NTIS, PC A06/MF A01.

See also PB–88-111968.

Eight major categories of legislation are summarized in the report: statewide strategies, ground-water classification, standard setting, land-use management, ground-water funds, agricultural chemicals, underground storage tanks, and water-use management. The report is divided into three sections: Part One compares legislation enacted in each state during the 1985-1987 sessions by category of legislation, in matrix form; Part Two summarizes all categories of legislation enacted on a state-by-state basis; and Part Three presents the legislation on a category-by-category basis. The survey of 1985 state legislation published by OGWP in 1987 was incorporated into the report.

43525 (PB–89-179865/XAB) **Comprehensive research plan: an agreement commitment report from the Chesapeake Executive Council. Final report.** Environmental Protection Agency, Annapolis, MD (USA). Chesapeake Bay Program. Jul 1988. 64p. Available from NTIS, PC A04/MF A01.

The plan outlines a process for meeting long-term research needs of the Chesapeake Bay Program. Recommendations include establishing the Research Planning Committee as a standing committee, development of a Chesapeake Bay research directory to be updated annually, an annual assessment of the previous year's research achievements, and an annual listing of research priorities including estimates of funding and resource requirements.

43526 (PB–89-179899/XAB) **Federal work plan: an agreement commitment report from the Chesapeake Executive Council. Final report.** Environmental Protection Agency, Annapolis, MD (USA). Chesapeake Bay Program. Jul 1988. 109p. Available from NTIS, PC A06/MF A01.

The work plan describes each participating Federal agency's Bay initiatives and the current level of coordination, outlines a process for expanding that cooperation, and indicates future directions for agency efforts in support of the 1987 Bay Agreement. The plan includes projections of possible projects and programs which may be the basis for coordinated, complementary budget proposals in the future.

43527 (PB–89-179907/XAB) **Federal facilities strategy: an agreement commitment report from the Chesapeake Executive Council. Final report.** Environmental Protection Agency, Annapolis, MD (USA). Chesapeake Bay Program. Jul 1988. 50p. Available from NTIS, PC A03/MF A01.

The Strategy identifies Federal facilities with the potential to affect the water quality and living resources of the Chesapeake Bay and establishes a timetable for implementation.

43528 (PB–89-179915/XAB) **Schedule for developing Baywide Resource Management Strategies: an agreement commitment report from the Chesapeake Executive Council. Final report.** Environmental Protection Agency, Annapolis, MD (USA). Chesapeake Bay Program. Jul 1988. 31p. Available from NTIS, PC A03/MF A01.

Schedules development of resource-management strategies to ensure that appropriate short- and long-term efforts for restoration and protection are under way Baywide. Includes target dates for developing resource-management strategies for submerged aquatic vegetation, tidal and non-tidal wetlands, waterfowl, finfish, shellfish, and other ecologically-valuable species.

43529 (PB–89-179923/XAB) **Baywide conventional pollutants control strategy: an agreement commitment report from the Chesapeake Executive Council. Final report.** Environmental Protection Agency, Annapolis, MD (USA). Chesapeake Bay Program. Jul 1988. 50p. Available from NTIS, PC A03/MF A01.

See also PB–88-142823.

The strategy outlines programs under way and planned by Bay watershed jurisdictions (Pennsylvania, Virginia, the District of Columbia, Maryland) to address the water-quality problems caused by conventional pollutants. It calls for a coordinated effort to improve the quality of control programs and proposes an annual Conventional Pollutant Working Conference to provide an information exchange forum.

43530 (PB–89-179956/XAB) **Chesapeake Bay wetlands policy: an agreement commitment report from the Chesapeake Executive Council. Final report.** Environmental Protection Agency, Annapolis, MD (USA). Chesapeake Bay Program. Dec 1988. 19p. Available from NTIS, PC A03/MF A01.

The Policy addresses the protection and restoration of both tidal and non-tidal wetlands through several elements, each with attendant policy goals and specific action items. The elements comprise a comprehensive wetland protection strategy with the immediate goal of no net-loss and the long-term goal of a net resource gain.

43531 (PB–89-179964/XAB) **Technical assistance and incentives to local governments. An agreement commitment report from the Chesapeake Executive Council. Final report.** Environmental Protection Agency, Annapolis, MD (USA). Chesapeake Bay Program. Dec 1988. 44p. Available from NTIS, PC A03/MF A01.

This report discusses fragile natural areas and ways in which governments can help protect them, presents in matrix form a listing of technical assistance and incentive programs currently available to local governments, and outlines a strategy for developing a more complete and more fully integrated set of technical assistance and incentive programs.

43532 (PB–89-182513/XAB) **Superfund Record of Decision (EPA Region 2): Brewster Well Field, Village of Brewster, Putnam County, New York (second remedial action), September 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1988. 44p. (EPA/ROD/R–02-88/066). Available from NTIS, PC A03/MF A01.

See also PB–87-188850.

The Brewster Well Field consists of two municipal well fields, No. 1 and No. 2, located on the northern bank of the East Branch Croton River, 3/4 of a mile east of the Village of Brewster, Town of Southeast in Putnam, New York. The 18 shallow wells in the field are a source of water for the municipal water system that serves over 2,100 residents in the Village of Brewster and the Town of Southeast, as well as a number of businesses and a railyard. Additional receptors of the ground water from this aquifer include downstream users of the East Branch Croton River, which contributes to the Croton Falls Reservoir approximately 3.5 miles downstream. Also, two reservoirs exist upstream to the east and northeast within 3000 feet of the site, which are part of New York City's Croton watershed

reservoir system. Land use to the north and west is predominantly residential, and to the south commercial and light industrial.

43533 (PB–89-184071/XAB) **Superfund Record of Decision (EPA Region 5): Environmental Conservation and Chemical Corporation, and Northside Sanitary Landfill, Zionsville, Indiana (first remedial action), September 1987. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 29 Sep 1987. 107p. (EPA/ROD/R–05-87/049). Available from NTIS, PC A06/MF A01.

Portions of this document are not fully legible.

The Northside Sanitary Landfill (NSL) and the Environmental Conservation and Chemical Corporation (ECC) are adjacent sites located in Boone County, Indiana. These two sites were combined into the first remedial action because of their close proximity and similarities in contaminants. Between 1977 and 1981 some still bottom and oily liquid wastes were permitted to be disposed of at NSL. Sometime between 1955 and 1962, NSL began landfill operations. From 1972 to 1973, numerous operational deficiencies, including failure to cover refuse, surface burning, underground fires, leachate and vermin problems resulted in three Indiana State Board of Health (ISBH) orders to cease operations. Ground water, surface water, soil and sediments are contaminated with inorganics, organics, pesticides, acids, base-neutral compounds, oils and VOCs including benzene, 1,1-DCE and TCE. The recommended alternative for the two sites combined includes: implementing deed and access restrictions to prevent future site development; excavation and dewatering of 4,200 cu yds. of leachate soils and sediments with onsite disposal under an RCRA multi-layer cap.

43534 (PB–89-184618/XAB) **Guidance on remedial actions for contaminated ground water at Superfund sites. Interim report (Final).** CH2M Hill, Gainesville, FL (USA). Dec 1988. 123p. Available from NTIS, PC A06/MF A01.

Also available from Supt. of Docs.

The guidance document focuses on key issues in the development, evaluation, and selection of ground-water remedial actions at Superfund sites. Statutory mandates require that remedies be protective and utilize permanent solutions and treatment technologies to the maximum extent practicable. Consistent with these mandates, the goal of Superfund ground-water actions is to restore groundwater to its beneficial uses within a reasonable time frame, given the particular site circumstances. The document presents the analytical framework and statutory basis for formulating ground-water alternatives, outlines factors that should be examined to evaluate and compare ground-water alternatives, highlights key considerations for selecting a ground-water remedy, and illustrates with a case study the remedial investigation and feasibility study process for ground-water. Although each Superfund site presents unique environmental conditions and human health problems, a consistent approach should be used when collecting and analyzing data and developing and evaluating ground water remedial alternatives.

43535 (PB–89-187421/XAB) **Report to Congress: Indian waste-water treatment needs and assistance.** Environmental Protection Agency, Washington, DC (USA). Office of Municipal Pollution Control. Jan 1989. 48p. (EPA–430/9-88/006). Available from NTIS, PC A03/MF A01.

This report was prepared in cooperation with the Indian Health Service (IHS) to meet the requirements of Section 518(b) of the Clean Water Act (CWA) as amended by the Water Quality Act (WQA) of 1987. The report's five major objectives are as follows: to summarize EPA's assessment of Indian waste-water treatment construction needs, to report on the degree to which such needs will be met through CWA funding, to identify any obstacles that may prevent such needs from being met, to discuss how EPA plans to implement the Indian Set-Aside Program established under Section 518(c) of the CWA, and to describe EPA's efforts to maximize Indian participation in CWA programs.

43536 (PB–89-188726/XAB) **Superfund Record of Decision (EPA Region 7): Midwest Manufacturing/North Farm Superfund Site. North Farm operable unit, Kellogg, Iowa, (first remedial action), September 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Sep 1988. 62p. (EPA/ROD/R–07-88/019). Available from NTIS, PC A04/MF A01.

This document describes the remedy that the U.S. Environmental Protection Agency (EPA) has selected to implement at the North Farm subsite of the Midwest Manufacturing/North Farm Site located near Kellogg, Iowa. The document also describes the decision-making procedures that were followed in selecting the preferred remedial action. The remedial action was selected to remedy an environmental problem that could potentially affect the health of the residents who may choose to live at the site in the future. Records indicate that electroplating activities took place at the site and involved the use of various heavy metals. A waste-water treatment plant was installed at the facility to treat the plant effluent before it was discharged into the local river. Solids generated at the treatment plant were temporarily stored in a tank onsite and periodically transferred to the disposal cell. Soil sampling was conducted onsite and downslope to evaluate the potential for contaminant migration due to previous waste-disposal practices. Analysis of the samples revealed that soil contamination had occurred via surface run-off.

43537 (PB–89-188783/XAB) **Superfund Record of Decision (EPA Region 2): Mid-State Disposal Landfill, Marathon Battery, Cold Spring, New York, (second remedial action), September 1988.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. 30 Sep 1988. 343p. (EPA/ROD/R–02-88/064). Available from NTIS, PC A15/MF A01.

See also PB–87-190096. Portions of this document are not fully legible.

The Marathon Battery Company (MBC) site, a former battery manufacturing plant, is located in the Village of Cold Spring in Putnam, New York, approximately 40 miles north of New York City. The site operated from 1952 to 1979 producing military and commercial batteries. During this time the site changed ownership several times, finally operating as the MBC from 1969 to 1979. Before 1965, the plant's wastewater treatment system discharged into the Hudson River at the Cold Spring pier via the Cold Spring sewer system, except during periods of overload or system shutdown during which time the process effluent was discharged directly into East Foundry Cove Marsh (EFCM) to the southeast. Between November 1972 and July 1973, a limited cleanup was conducted by MBC and other responsible parties, to remove sediment from parts of Foundry Cove and surrounding areas contaminated with cadmium and nickel in excess of 900 mg/kg. The selected remedial action for Area II at this site includes: decontamination of the former battery facility; excavation; and offsite disposal.

43538 (PB–89-189468/XAB) **Superfund Record of Decision (EPA Region 3): West Virginia Ordnance Works, Mason County, West Virginia, (second remedial action), September 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. Sep 1988. 62p. (EPA/ROD/R–03-88/053). Available from NTIS, PC A04/MF A01.

See also PB–88-106455. Portions of this document are not fully legible.

The West Virginia Ordnance (WVO) site covers approximately 8,323 acres in Mason County, West Virginia. It is located on the east bank of the Ohio River. General Chemical Defense Corporation of New York operated the plant until 1945. Red and yellow water (liquid wastes) were produced during the TNT manufacturing process. Yellow water was discharged to the Mill Creek drainage system, which eventually drains into the Ohio River; red water was discharged directly to the Ohio River through a pipe located about one foot offshore. In May 1981, ranger officials observed a seep of red water adjacent to a pond located on the wildlife station. Upon examination, ground water discharging to this pond was found to be contaminated by di- and trinitrotoluenes and phenol. The selected remedial action for this site addresses three distinct areas of contamination.

43539 (PB–89-189484/XAB) **Superfund Record of Decision (EPA Region 2): Beachwood/Berkeley Wells, Ocean County, New Jersey (first remedial action), June 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. Jun 1988. 45p. (EPA/ROD/R–02-88/062). Available from NTIS, PC A03/MF A01.

The Beachwood/Berkeley Well site, encompasses Beachwood Borough and Berkeley Township in central-east Ocean City, NJ. The total population of the two municipalities is approximately 23,000. In response to a public complaint of possible aluminum contamination of drinking water, the New Jersey Department of Environmental Protection (NJDEP) sampled four potable wells and discovered the presence of lead in exceedance of the Federal Interim Primary Drinking Water Standard. Subsequent sampling confirmed the presence of lead at approximately 4 times the standard. It was concluded that elevated concentrations of lead in drinking water were not caused by man-made or industrial sources. Rather, the sources of lead include: a minor contribution from native-area ground water, lead packers used in well construction, and dissolution of lead from lead-bearing materials of home plumbing systems, particularly lead/tin solder. The State of New Jersey is proceeding independently of Federal Superfund financing to address the presence of and the problems posed by lead in drinking water.

43540 (PB–89-189518/XAB) **Superfund Record of Decision (EPA Region 2): GE Wiring Devices, Juana Diaz, Puerto Rico (first remedial action), September 1988. Final report.** Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response. Sep 1988. 36p. (EPA/ROD/R–02-88/069). Available from NTIS, PC A03/MF A01.

The GE Wiring Devices site is located in Juana Diaz, Puerto Rico. The General Electric Company (G.E.) owns and operates a five-acre wiring devices plant at this site, which assembled silent mercury switches from 1957 until 1969. Approximately half a ton of mercury was discarded along with 4,000 cu yds of defective switch parts and plastic scraps in an onsite waste-fill area about 1 acre in area and 1 to 4 feet deep. Ground water in the area is used as a source of drinking water with a public supply well located approximately 1,500 feet west of the waste-fill area. Evidence indicates that contamination of the water table is occurring due to the migration of perch water through the clay layer that exists beneath the waste-fill area. Approximately 1,500 cu yds of near-surface soil south and downgradient of the waste-fill area has been contaminated by mercury as a result of previous surface runoff from the plant area. The selected remedial action for this site includes: onsite hydrometallurgical treatment of the waste-fill materials, perched water, and contaminated near-surface soil with disposal of the treatment residue in the former waste-fill area, followed by covering with a clean soil cover, and onsite treatment of the process leaching agent.

43541 (PB–89-190581/XAB) **USEPA (Environmental Protection Agency) method study 36 SW-846 methods 8270/3510, GC/MS (gas chromatography/mass spectrometry) method for semivolatile organics: capillary-column technique separatory-funnel liquid-liquid extraction. Final report, September 1986-December 1987.** Edgell, K.W.; Wesselman, R.J. Bionetics Corp., Cincinnati, OH (USA). Apr 1989. 289p. (EPA–600/4-89/010). Available from NTIS, PC A13/MF A01.

An interlaboratory collaborative study was conducted to determine the precision and bias (recovery) of Office of Solid Waste (OSW) 8270/3510 for the analysis of 59 semivolatile organic compounds in groundwater. OSW Method 8270 is entitled 'GC/MS Method for Semivolatile Organics Capillary Column Technique' and includes instructions for quality control, sample preparation, and analysis of samples by GC/MS. OSW Method 3510 is entitled 'Separatory Funnel Liqui-Liquid Extraction.' The study design was based upon Youden's non-replicate plan for collaborative tests of analytical methods. Each water type was spiked with three Youden sample pairs of the 59 semivolatile compounds and analyzed using Methods 8270/3510. The test waters included reagent water as a 'control' against which other test data were compared and two types of ground water. The resulting data were analyzed using the USEPA computer program entitled, 'Interlaboratory Method Validation Study (IMVS).' The data analyses produced measures of precision and recovery for each compound in each water type and compared the performance of the method between water types.

43542 (GU–87-02) **Implications of climatic change for agriculture in Ontario. A summary of Land Evaluation Group reports.** Smit, B. Guelph Univ., ON (Canada). 1987. 50p. (In English and French). (MICROLOG–87-04819). Available from Canadian Program Office, Canadian Climate Centre, 4905 Dufferin Street, Downsview, ON, CAN M3H 5T4; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This report summarizes the results of two studies of the impacts of climate change on the agri-food sector in Ontario. Two scenarios for climatic change associated with an increase in atmospheric concentrations of carbon dioxide were used, based on models developed by two different research organizations. The potential impacts of each scenario were assessed on the following aspects: climatic resources for crop production; productivity levels for major crops; current levels and value of crop production; and economic suitability of land resources for crop production. The study was designed to gauge the sensitivity of each aspect of agriculture to the specified changes in climatic conditions, as measured by comparing possible adjustments to each aspect given changes in climate from current norms. It was demonstrated that climatic changes could have profound effects on Ontario's agri-food sector. New opportunities for agricultural production in northern Ontario suggest prospects for a major expansion of the agricultural economy there. In other regions, especially the agricultural heartland of the southwest, production prospects for many common crops would be diminished. There also appear to be opportunities for diversifying agriculture in other regions of the province. The length of the growing season is likely to become less of a constraint, but moisture deficit is expected to become a more important limiting factor. 5 figs., 4 tabs.

5302 Assessment of Energy Technologies

43543 (ACUNS–8701, pp. 154-163) **The natural realm in the Arctic. A critique from a developmental perspective.** French, H.M. Association of Canadian Universities for Northern Studies (ACUNS), Ottawa, ON (Canada). 1987. (CONF-8508276–: Arctic heritage, Banff (Canada), 24-28 Aug 1985; MICROLOG–87-03004). In *Arctic heritage. Proceedings of a symposium.* Available from Association of Canadian Universities for Northern Studies, 130 Albert Street, Ottawa, ON, CAN K1P 5G4; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The intent of this paper is to assess the significance of our current understanding of the physical environment of Canda's Arctic within a context of assumed economic development in the area. As second objective is to illustrate the degree to which certain geotechnical problems associated with northern development have been solved. At least two perspecitves are highlighted. These are: the belief that in the longrun, it is probably more difficult to restrict industrial activities in the Arctic than those of tourism and the local inhabitants, and the often conflicting opinions concerning the sensitivity of the physical environment of the Arctic, and its variable ability to withstand stress. There is no doubt that natural resources development, especially that of hydrocarbons will be the major stress imposed upon northern Canada in the next thirty years. One problem which complicates the adoption of any one preservation strategy is that the sensitivity of the arctic environment to an imposed stress, or streses, is difficult to determine. Some research into consequences of terrain disturbance, geotechnical responses, and frost heave problems are outlined. There is no doupt that man is able to disrupt seriously the unique Arctic environments, probably with more long lasting, costly, and devastating results than in any other environment. On the other hand, there is evidence that man is capable and willing to minimize the deleterious long-term effects associated with economic development. Furthermore, the physical environment is probaly better able

to adjust to these impacts than is commonly assumed. Finally, improvements in industrial operating techniques in northern regions will also act ot mitigate environmental impact. 20 refs., 4 figs.

43544 (AD-A–206086/1/XAB) **Environmental Impact Statement. Peacekeeper Rail Garrison Program. Executive Summary. Final report.** Air Force Regional Civil Engineer, Norton AFB, CA (USA). Ballistic Missile Support. Feb 1989. 60p. Available from NTIS, PC A04/MF A01.

The U.S. Air Force proposes to deploy 50 Peacekeeper missiles on 25 trains, which will be based at F.E. Warren AFB, Wyoming, and at up to 10 other Air Force installations. If the Peacekeeper Rail Garrison system is approved for deployment, F.E. Warren AFB would be the Main Operating Base (MOB) and the first garrison installation. After the EIS is filed, the other garrison installations to be used would be selected from the 10 candidates and the decision would be documented in one or more Records of Decision. Up to four trains could be deployed at the MOB and at each selected garrison installation. Peacekeeper missiles would be assembled and integrated onto missile launch cars at F.E. Warren AFB and then dispatched to other selected garrison installations. Periodically, a training train, with no missile propellants or warheads onboard, would travel to each of the garrison installations for operations, security, and maintenance training. Periodically, for maintenance or test launches, missiles (without warheads) would be moved by rail between garrisons and F.E. Warren AFB, Wyoming or Vandenberg AFB, California. During periods of national need and upon receipt of direction from a higher authority, Peacekeeper trains could be dispersed onto the national rail network to improve their survivability. Potential environmental impacts are considered in the FEIS under the following environmental resource categories: socioeconomics, utilities, transportation, land use, cultural, biological, water, geology and soils, air quality, and noise. In addition, national economic impacts, national railroad transportation impacts, and safety considerations are discussed.

43546 (AD-A–206088/7/XAB) **Environmental Impact Statement. Peacekeeper Rail Garrison Program. Volume 2. Public comments. Final report.** Air Force Regional Civil Engineer, Norton AFB, CA (USA). Ballistic Missile Support. Feb 1989. 845p. Available from NTIS, PC A99/MF E04.

See also Volume 1, AD-A206 087.

This Volume of the Final Environment Impact Statement (EIS) includes comments and responses on the Draft EIS for the Peacekeeper Rail Garrison program at F.E. Warren Air Force Base (AFB), Wyoming and ten candidate deployment installations; all original written comment documents; and public hearing transcripts (comments sections only) as recorded by court reporters for each of the 11 public hearings held on the Draft EIS.

43547 (AD-A–206960/7/XAB) **Draft environmental impact statement: Peacekeeper rail garrison program.** Department of the Air Force, Washington, DC (USA). Jun 1988. 777p. Available from NTIS, PC A99/MF E04.

The U.S. Air Force proposes to deploy 50 Peacekeeper missiles on 25 trains, which will be based at F.E. Warren AFB, Wyoming, and at up to ten other garrison installations. Peacekeeper missiles would be assembled and integrated onto the missile launch cars at F.E. Warren AFB and then dispatched to other selected garrison installations. Periodically, a training train, with no missile propellants or warheads onboard, would travel to each of the garrison installations for operations, security, and maintenance training. Periodically, for maintenance or test launches, missiles (without warheads) would be moved by rail between garrisons and P.E. Warren AFB or Vandenberg AFB. During periods of national need and upon receipt of direction from the National Command Authority, Peacekeeper trains could be dispersed onto the nation's rail network to improve their survivability. The Alternative Action is to deploy 100 Peacekeeper missiles on 50 trains. Potential environmental impacts associated with both of these actions are considered in the DEIS under the following environmental resource categories: socioeconomics, utilities, transportation, land use, cultural, biological, water, geology and soils, air quality, and noise. In addition, national economic impacts, national railroad transportation impacts, and safety considerations are discussed. Finally, mitigation measures that can be taken to rehabilitate or restore the affected environment or to reduce significant adverse impacts are identified.

43548 (DOE/AL/10752–41) **Review of the draft supplement environmental impact statement: DOE/EIS-0026-DS, Volumes 1 and 2, DOE Waste Isolation Pilot Plant, April 1989.** Environmental Evaluation Group, Albuquerque, NM (USA). Jul 1989. 110p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-78AL10752. (EGG–41). Order Number DE89015377/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

The Draft Supplement Environmental Impact Statement (SEIS) for WIPP does not provide adequate justification to support the proposed action of shipping up to 620,000 cubic feet of transuranic (TRU) waste to WIPP before demonstrating compliance with the Environmental Protection Agency's (EPA) Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and Transuranic Radioactive Wastes. The "alternative action" of shipping no waste to WIPP prior to demonstrating compliance with the EPA Standards has been dismissed without sufficient discussion and justification. The document contains mistakes in calculations, reflects an erroneous knowledge of the history of the project, presents tables without units, and displays an indifference to the statistical precision of predictions. It also does not adequately address the environmental impacts of the potential failure to complete the demonstration of compliance with the EPA Standards by October 1993. By comparison, DOE plans to complete the demonstration of compliance with the same standards before starting construction of the high-level waste repository in Nevada. These two diametrically opposed approaches by DOE, for WIPP and for the Yucca Mountain repository, need to be addressed.

43550 (PB–89-178131/XAB) **Ecology and conservation of the endangered least Bell's vireo. Biological report.** Franzreb, K.E. Fish and Wildlife Service, Sacarmento, CA (USA). Mar 1989. 25p. (BIOLOGICAL–89(1)). Available from NTIS, PC A03/MF A01.

At one time considered common, the least Bell's vireo (Vireo bellii pusillus) was distributed throughout the Central Valley and other low elevation riverine systems in California and Baja California, Mexico, but now has been extirpated from the majority of its breeding range. Habitat loss from agricultural, urban, and commercial activities, as well as other habitat modifying actions has severely restricted the bird's range. Predation by brown-headed cowbirds is now the major problem in the the few remaining habitats of this endangered bird. Extensive suitable riparian habitat for the least Bell's vireo must be secured and protected so that the population may increase and be maintained in perpetuity. Methods to reintroduce vireos into the Central Valley and other areas within the historical range that are presently unoccupied should be evaluated.

43551 (DOE/ER/13426–3) **Structural studies of complex carbohydrates of plant cell walls: Progress report, December 1986–June 1989.** Darvill, A. Georgia Univ., Athens, GA (USA). Complex Carbohydrate Research Center. Jun 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract FG09-85ER13426. Order Number DE89015797/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Characterizing the polysaccharides that constitute the primary cell walls of plants has been a major research goal of our laboratory for many years. During the past three years we have made considerable progress towards this goal. In particular, we have emphasized the structural studies of three of the major non-cellulosic polysaccharides; namely, the pectic polysaccharides rhamnogalacturonan I (RG-I), and rhamnogalacturonan II (RG-II), and the hemicellulosic polysaccharide xyloglucan. We have identified and partially characterized the major pectic polysaccharides present in the primary cell walls of suspension-cultured monocot (maize and rice) and gymnosperm (Douglas fir) cells. We have come to realize that RG-I, RG-II and xyloglucan, together with homogalacturonan are arabinoxylan, constitute the predominant non-cellulosic polysaccharides of primary cell walls. In fact, we have accumulated considerable evidence to suggest that these are the predominant and perhaps only non-cellulosic polysaccharides of primary cell walls. While writing a comprehensive review of the pectic polysaccharides of primary cell walls we came to realize that all of the pectic polysaccharide fragments described in the literature may have originated from homogalacturonan, RG-I, or RG-II. Indeed, we have been quite surprised by the remarkable structural conservation of these very complicated polysaccharides in cell walls originating from such evolutionarily diverse plants. Furthermore, our structural studies of cell wall hemicellulosic xyloglucan have reinforced the concept that cell wall polysaccharides have extremely complicated and evolutionarily-conserved structures.

43552 (DOE/ER/13709–3) **Molecular characterization of phytochrome from green avena: Technical progress report.** Georgia Univ., Athens, GA (USA). Research Foundation. Jul 1989. 13p. Sponsored by U.S. DOE Energy Research. DOE Contract FG09-87ER13709. Order Number DE89015800/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Both the physicochemical properties of phytochrome and its biological functions are best understood with reference to etiolated plant tissues. Phytochrome plays, however, and important role in green plants as well. For many years it was tacitly assumed that phytochrome in green plants was the same as that in etiolated seedings, primarily because it is exceedingly difficult to isolate and characterize phytochrome from green plants. Nevertheless, it was occasionally hypothesized that phytochrome should be heterogeneous, with different types of phytochrome predominating in dark- and light-grown tissue. Largely as the result of DOE-funded research programs over the past eight years, these early hypotheses have been found to be valid. It is now evident that etiolated- and green-plant phytochromes are distinctly different from one another. 5 figs.

DOE Contract W-7405-ENG-36. (CONF-8908104–2: 7. international conference on mathematical and computer modelling, Chicago, IL (USA), 2-5 Aug 1989). Order Number DE89015249/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this paper the thermal equilibrium number of solitons in DNA as a function of absolute temperature and the number of base pairs is calculated. These calculations are effected by modeling DNA as a Toda lattice with parameters chosen to match experimentally measured properties of DNA. It is found that a significant number of solitons is generated at physiological temperature. 23 refs., 2 figs.

43555 Synchrotron resource of the Howard Hughes Medical Institute. Staudenmann, J. (Howard Hughes Medical Institute, NSLS X4, Bldg. 725, Brookhaven National Laboratory, Upton, New York 11973-5000 and Department of Electrical Engineering, Columbia University, New York, New York 10032 (US)); Hendrickson, W. A.; Abramowitz, *Review of Scientific Instruments (USA)*, 60(7): 1939-1942 (Jul 1989).

The Synchrotron Resource of the Howard Hughes Medical Institute will be dedicated to structural analyses of biological macromolecules, primarily through crystallography. This facility is under construction at the X4 port of the National Synchrotron Light Source at Brookhaven National Laboratory, and it will comprise three beamlines. The first line to be built has been devised to apply the multiwavelength anomalous diffraction method which provides direct estimates for the phases of reflections. The second line will be devoted to rapid and essentially routine diffraction measurements, mainly through the rotation method. These two experimental stations are contained within refrigerated radiation enclosures that will maintain clean environments, narrowly defined constant temperatures, and protection against biohazard at biosafety level BL-2. At the same time as the second line will be developed, the swath center is planned to first serve as a monitor of the white x-ray beam vertical stability. This project will be done in collaboration with accelerator physicists of the National Synchrotron Light Source. Later, this third line will be equipped for Laue experiments to study, for instance, dynamical processes in proteins.

43556 (CONF-8907113–5-Vugraphs) **Protamines in mammalian germ cell mutagenesis.** Sega, G.A. Oak Ridge National Lab., TN (USA). 1989. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 5. international conference on environmental mutagens; 10-15 Jul 1989. Order

Number DE89015367/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

In the development from stem cells to functional spermatozoa, the germ cells of all mammals progress through a series of similar stages. Many studies have been carried out in mice with a variety of chemical agents that have produced differential genetic sensitivity in the various germ-cell stages depending on the agent being tested. In studies of the genetic effects of chemical agents in mice, the exposure given to the animals (by injection, inhalation, skin application, etc.) is accurately known. However, in general, nothing is known about the molecular dose of the chemical that actually reaches the different germ-cell stages. In particular, the chemical mutagens ethyl methanesulfonate (EMS), methyl methanesulfonate (MMS), ethylene oxide (EtO) and acrylamide (AA) have all been shown, in genetic studies, to produce very many more dominant lethal mutations and heritable translocations in late spermatids and early spermatozoa than in other germ-cell stages in male mice. We have, subsequently, used all 4 of these chemical mutagens in radioactive form to find out where they are binding within the germ cells and to see what correlations may exist between the extent of chemical binding in different stages and the amount of induced genetic damage. 17 refs., 4 figs.

43557 (PNL–6500-Pt.4, pp. 52-53) **Production of perfused cultures of Chinese hamster ovary cells.** Nelson, J.M.; Metting, N.F.; Braby, L.A. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Several years ago we discovered that Chinese hamster ovary (CHO) cells could be put into stationary phase by nutritional deprivation, at which time DNA synthetic activity was depressed between 2 and 3 orders of magnitude. At the time that we evaluated the starved plateau-phase CHO cells in detail, we had also noticed that intermittently fed populations never stop cycling at all. We believed that if the cultures could be fed continuously, then the cell density might reach a considerably higher level and the cells arrested by contact inhibition along. Perfused cells should also be more representative of resting cells in vivo because they would not be stressed with respect to nutrient availability. Under these circumstances, we should expect cells to exit the cycle at only one stage, probably just before or after mitosis. To test this possibility, we have attempted to produce plateau-phase cultures of perfused CHO cells using a very low speed peristaltic pump to supply a continuous infusion of nutrient medium to each individual plate. These experiments were met with considerable difficulties. It appears that the demands of this technique exceed the capability of the best commercially available pumping equipment. It also seems unlikely that satisfactory pumping techniques can be developed for continuous perfusion, at a reasonable cost. Consequently, alternative solutions involving the automated frequent feeding, e.g., between 1 and 4 times per day, are currently being investigated.

43558 (UCRL–52000-88-10, pp. 23-29) **Three-dimensional image analysis for studying nuclear chromatin structure.** Dean, P.N. Lawrence Livermore National Lab., CA (USA). Oct 1988. In *Energy and technology review.* Order Number DE89005308/JAW. Available from NTIS, PC A03/MF A01.

A light-microscope-based system for acquiring cross-sectional views of cell nuclei and computer codes to analyze these images and reconstruct the three-dimensional structures they represent were developed. This equipment will be used to study the arrangement of chromosomes in intact cell nuclei,k using fluorescent hybridization to tag individual chromosomes for better visualization. 4 references, 8 figures.

Duke Univ., Durham, NC (USA). Dept. of Botany. 15 Jul 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-87ER60575. Order Number DE89015926/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The overall study is an investigation of physiological adaptations in plants grown for long periods in enhanced CO2 levels. The objectives of this research are: to improve the empirical data base of the effect of CO2 and climate variables on plants and ecosystems, paying particular attention to mechanisms of photosynthetic decline and the physiological controls of whole-plant growth, and to contribute new information to an integrated modeling approach for examining the effects of different CO2 and multiple environmental factors on whole plants and ecosystems data will be provided to the improved PRECO and SERECO-type models.

43560 **Clinical aspects of neutron capture therapy.** Basic Life Sciences, Vol. 50. Fairchild, R.G.; Bond, V.P.; Woodhead, A.D.; Vivirito, K. (eds.). 370p. Plenum Press, New York, NY (1988). Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH00016. (CONF-8802102–: Workshop on clinical aspects of Boron Neutron Capture Theory (BNCT), Upton, NY (USA), 1-2 Feb 1988).

This document contains 36 papers presented at a conference on the current states of boron neutron capture therapy. Topics include radiation dose rates, clinical trials, dose fractionation, therapeutic results, neoplasms, radiation tolerance, and the blood-brain barrier. Individual papers are indexed separately for the data base. (TEM)

43561 (EGG-BNCT–8319) **Non-reactor neutron sources for BNCT [Boron Neutron Capture Therapy].** Dolan, T.J.; Ottewitte, E.H.; Wills, E.E.; Neuman, W.A.; Woodall, D.M. EG and G Idaho, Inc., Idaho Falls, ID (USA). May 1989. 68p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE89016211/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The focus of this study is the indentification of key feasibility issues for the use of non-reactor neutron sources for Boron Neutron Capture Therapy (BNCT). Of the non-reactor neutron sources surveyed, the $^{7}Li(p,n)$ reaction appears to be the most favorable for producing epithermal neutrons for BNCT, and RFQ accelerators are best for producing the desired proton beam. At a proton energy of 2.5 MeV, the total neutron yield is 1.49×10^{-4} neutrons/proton, with a forward energy spectrum extending up to 780 keV and peaked at 500-600 keV. At I = 20 mA, the total neutron yield would be about 1.86×10^{13} neutrons/s. In comparison with a medical therapy fission reactor, the 20 mA accelerator system has a flux intensity at least 5 times lower, requiring an irradiation time at least 5 times longer, a much higher gamma intensity, which would probably require additional shielding, further reducing the neutron intensity, 30% of the neutrons above 15 keV, resulting in a higher fast neutron dose to healthy tissue, poorer spatial uniformity of the neutron beam, and greater angular divergence of the neutron beam, resulting in a rapid decrease of flux with distance from the filter. The possibility of overcoming these limitations by using more shielding and a higher beam current needs further study. RFQ accelerator technology is being developed to provide the desired proton beam parameters. The effects of neutron beam energy spectra, beam contaminants, angular divergence, spatial variation, and beam rotation around the tumor need to be studied in detail, in order to evaluate the feasibility of accelerator-produced neutrons for BNCT. 41 refs., 20 figs., 8 tabs.

43562 (IAEA-TECDOC–501) **Atlas of liver imaging. A compendium of liver images used in a co-ordinated research programme on evaluation of nuclear medicine imaging procedures for the diagnosis of liver diseases.** International Atomic Energy Agency, Vienna (Austria). May 1989. 228p. Order Number

DE89635283/JAW. Available from NTIS (US Sales Only), PC A11/MF A01 - OSTI; INIS.

This atlas is an outcome of an IAEA co-ordinated research programme. In addition to Japan, nine other Asian countries participated in the project and 293 liver scintigrams (116 from Japanese institutions and 177 from seven Asian countries) were evaluated by physicians from the participating Asian countries. The computer analysis of the scan findings of the individual physicians was carried out and individual scores have been separately tabulated for: (a) scan abnormality; (b) space occupying lesions; (c) cirrhosis and (d) diffuse liver diseases like hepatitis. Refs, figs and tabs.

43563 (INIS-mf–11503, pp. 7) **Diagnostic imaging with ^{99m}Tc labelled pharmaceuticals.** Weininger, J. (Soreq Nuclear Research Center, Yavne (Israel). Dept. of Radiopharmaceuticals). Israel Nuclear Society, Yavne (Israel). Mar 1989. (CONF-8903152–: Nuclear Societies of Israel annual meeting, Beer-Sheva (Israel), 13 Mar 1989). In *Annual Meeting 1989*. Order Number DE89012204/JAW. 43566 (JINR–18-88-392) **Forming and study of a high energy neutron beam from JINR phasotron.** Abazov, V.M.; Gustov, S.A.; Zielczynski, M. and others. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems. 1988. 14p. (In Russian). Order Number DE89635378/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

First results are presented on forming the therapeutic neutron beam at mean energy of a few hundred MeV. THe beam is obtained from thick target bombarded with 660 MeV protons extracted from the conversed proton at the Laboratory of Nuclear Problems, JINR. The optium target is selected. Determination of absolute value of absorbed dose and spatial dose distribution in a water phantom are considered. It is shown that the geometrical distribution of dose absorbed in phantom for the high energy neutron beam is practically the same as for a broad therapeutic beam of protons, but using of the neutron beam promises in some cases a therapy gain due to overcoming of radioresistency of hypoxic cancer cells. 28 refs.; 8 figs.; 1 tab.

43567 (ORNL/FTR–3332) **[Equipment requirements for vaccine refrigeration, Rabat and Marakech, Morocco, June 1989]: Foreign trip report.** Durand, J.M. Oak Ridge National Lab., TN (USA). 10 Jul 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89016158/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The consultant traveled to Morocco to assess the equipment requirements for the vaccine cold chain, comparing the need for additional absorption refrigeration systems with the financial viability of a conversion to photovoltaic powered vapor compression equipment. The consultant found that bottled gas has proven to be a cost effective and available fuel and moreover can be used very effectively for sterilization purposes in rural health clinics. Unless they could be introduced in groups of 50 systems or more in concentrated areas, photovoltaic systems were not seen as a viable alternative to gas fueled absorption systems, due to higher life cycle costs and to the absence of a maintenance network. Introduction of PV systems were recommended for lighting purposes, however, to supplement the energy uses in rural clinics.

43568 (PB–89-167183/XAB) **Principles of particle radiography and possible medical application.** Jones, D.T.L. Council for Scientific and Industrial Research, Faure (South Africa). National Accelerator Centre. 1987. 21p. (NAC–87-05). Available from NTIS, PC EE04/MF E04.

North American Continent sales only.

Beams of neutrons from the p(66 MeV)/Be reaction and protons (up to 200 MeV) will be available at the NAC for medical applications. The principles of neutron and proton radiography are discussed. It is concluded that proton radiography may have some applications in the medical field, while neutron radiography will be of little use.

43569 (PB–89-193858/XAB) **NBS (National Bureau of Standards) measurement services: calibration of gamma-ray-emitting brachytherapy sources. Final report.** Weaver, J.T.; Loftus, T.P.; Loevinger, R. National Bureau of Standards, Washington, DC (USA). Center for Radiation Research. Dec 1988. 63p. (NBS/SP–250/19). Available from NTIS, PC A04/MF A01.

Also available from Supt. of Docs. as SN003-003-02923-8. Library of Congress catalog card no. 88-600609.

The calibration of small radioactive sources used for interstitial radiation therapy, short-distance therapy (brachytherapy), is performed in terms of the physical quantities exposure or air kerma. (60)Co and (137)Cs sources are calibrated by comparison with NBS working standard sources of the same type, while (192)Ir and (125)I sources are calibrated by measurement in a reentrant ionization chamber that was calibrated using NBS working standard sources of the same type. The working standard sources were calibrated using the NBS graphite cavity ionization chambers except for (125)I, for which the NBS measurement standard was a free-air chamber. The working standard sources of the two long-lived sources have been measured a number of times over the years; the reliability of the reentrant chamber for the two short-lived sources is assured by use of sealed radium sources as a constancy check. The overall uncertainty (considered to have the approximate significance of a 95% confidence limit) is given as 2% for all the sources except for (125)I seeds, for which it is given as 5%, 6%, and 7%, depending on the type of seed. The stated uncertainty for (125)I seeds does not include possible errors due to low-energy X rays not recognized at the time the standards were established.

43570 Detection and treatment of occult metastases with radiolabeled monoclonal antibodies. Raventos, A. (Univ. of California, Davis, CA (US)); DeNardo, S.J.; DeNardo, G.L. pp. 247 of Occult nodal metastasis in solid carcinomata. Moloy, P.J.; Nicolson, G.L. Praeger Publications Inc., New York, NY (1987).

Monoclonal antibody (MAb) technology is entering its second decade already well established as an important tool of science, and many clinical applications are under investigation. Among these is tumor imaging, using radiolabeled MAbs. The radiochemistry of labeling antibodies with preservation of immunoreactivity has been developed for several elements including indium (In) and iodine (I) and is under development for copper, bromine, yttrium, technetium, rhenium, and astatine. Each has advantages and disadvantages; different radionuclides are optimum for different situations. Several dozen MAbs to carcinomas are in regular production and are shared among investigating laboratories. Virtually all of them show pancarcinoma reactivity; that is, they bind to a broad class of carcinomas. Only rarely does one MAb react with all carcinomas from a particular organ site.

43571 New radiohalogenated alkenyl tellurium fatty acids. Srivastave, P.C. (Oak Ridge National Laboratory, TN (USA)); Knapp, F.F. Jr.; Kabalka, G.W. *Phosphorus and Sulfur and the Related Elements (UK)*, 38(1-2): 49-58 (Jul 1988). DOE Contract

AC05-84OR21400. (CONF-8708173--: 5. international symposium on the chemistry of selenium and tellurium, 24-28 Aug 1987).

Radiolabeled long-chain fatty acids have diagnostic value as radiopharmaceutical tools in myocardial imaging. Some applications of these fatty acids are limited due to their natural metabolic degradation in vivo with subsequent washout of the radioactivity from the myocardium. The identification of structural features which will increase the myocardial residence time without decreasing the heart uptake of long-chain fatty acids is of interest. Fatty acids containing the tellurium heteroatom were the first modified fatty acids developed and show unique prolonged myocardial retention and low blood levels. Our detailed studies with radioiodinated vinyliodide substituted tellurium fatty acids demonstrate that heart uptake is a function of the tellurium position. New techniques of tellurium and organoborane chemistry have been developed for the synthesis of a variety of radioiodinated iodoalkenyl tellurium fatty acids.

43572 A multigrid expectation maximization reconstruction algorithm for positron emission tomography. Ranganath, M.V. (9508070); Dhawan, A.P.; Mullani, N. *IEEE Transactions of Medical Imaging (USA)*, 7(4): 273-278 (Dec 1988).

The problem of reconstruction in positron emission tomography (PET) is basically estimating the number of photon pairs emitted from the source. Using the concept of the maximum likelihood (ML) algorithm, the problem of reconstruction is reduced to determining an estimate of the emitter density that maximizes the probability of observing the actual detector count data over all possible emitter density distributions. A solution using this type of expectation maximization (EM) algorithm with a fixed grid size is severely handicapped by the slow convergence rate, the large computation time, and the non-uniform correction efficiency of each iteration making the algorithm very sensitive to the image pattern. An efficient knowledge-based multigrid reconstruction algorithm based on the ML approach is presented to overcome these problems.

43573 X-ray microtomography with monochromatic synchrotron radiation. D'Amico, K. L. (Corporate Research Laboratories, Exxon Research and Engineering Company, Annandale, New Jersey 08801 (US)); Deckman, H. W.; Dunsmuir, J. H.; Flannery, B. P.; Roberge, W. G. *Review of Scientific Instruments (USA)*, 60(7): 1524-1526 (Jul 1989).

We review results obtained with the Exxon Microtomography apparatus. The technique is based on tomographic methods widely used in medicine and nondestructive evaluation. When used with a tunable x-ray source, it is a powerful diagnostic and research tool for a wide variety of materials problems. It is capable of producing maps of the interior structure and chemical composition of samples approximately 0.5–1.0 mm in size, with spatial resolution in the map of the density variations approaching 10.0 μm.

43574 Coronary angiography using synchrotron radiation. Thompson, A. C. (Center for X-Ray Optics, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Rubenstein, E.; Zeman, H. D.; Hofstadter, R.; Otis, J. N.; Giacomini, J. C.; Gordon, H. J.; Brown, G. S. *Review of Scientific Instruments (USA)*, 60(7): 1674-1679 (Jul 1989). DOE Contract FG03-87ER60527.

Imaging of coronary arteries using a venous instead of an arterial injection of contrast agent could provide a much safer method to diagnose heart disease. The tunability, intensity, and collimation of synchrotron radiation x-ray beams makes possible imaging systems with greatly improved imaging sensitivity. A pair of fan x-ray beams, a movable patient chair, and a multielement x-ray detector are used to acquire a pair of x-ray images above and below the iodine *K* edge. The logarithmic subtraction of these two images produces an image with excellent sensitivity to contrast agent and minimal sensitivity to bone and tissue. High-quality images from a dog and preliminary images from five humans have been obtained. Improvements are being made to the system to increase the effective radiation flux and to measure the position of both x-ray beams.

43575 (DOE/ER/60685–2) **Improvement of the subsurface microbial culture collection: Progress report.** Balkwill, D.L. Florida State Univ., Tallahassee, FL (USA). Dept. of Biological Science. 15 Aug 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER60685. Order Number DE89016154/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report summarizes progress made in our laboratory toward completion of the experimental plan for our ongoing DOE grant project entitled "Improvement of the Subsurface Microbial Culture Collection". A copy of the experimental plan from our original proposal for this grant is provided in Appendix I. The initial funding period for the aforementioned grant ran from May 15, 1988 through December 14, 1988. On August 15, 1988, we submitted a continuation request for the second (and current) funding period (December 15, 1988 through December 14, 1989). A copy of the experimental plan from the continuation proposal is provided in Appendix II. On August 15, 1988, we also submitted a progress report on work completed from the start of the grant through that date. A copy of this report (DOE/ER/60685–1) is provided in Appendix III. The current report (DOE/ER/60685–2), then summarizes the work that we completed between August 15, 1988 (The date of the previous report) and August 15, 1989 (the date of the current report). Most of this work was performed during the second funding period of the grant, although a small portion of it occurred during the last part of the first funding period. The report below distinguishes between the two funding periods.

43576 (EGG-M–88344) **Genetics of acidophilic, heterotrophic bacteria.** Ward, T.E.; Bruhn, D.F.; Watkins, C.S.; Rowland, M.L.; Bulmer, D.K.; Winston, V. EG and G Idaho, Inc., Idaho Falls, ID (USA); Idaho State Univ., Pocatello, ID (USA). [1988]. 16p. Sponsored by U.S. DOE Fossil Energy. DOE Contract AC07-76ID01570. (CONF-8808104–3: DOE Office of Fossil Energy workshop on bioprocessing of coals, 15-18 Aug 1988). Order Number DE89016212/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The genetic characteristics of members of the genus Acidiphilium are poorly understood. As part of our study of the genetics of these bacteria, a search was made for an inducible, lysogenic bacteriophage. Such a bacteriophage has been discovered. Several properties of the phage have been investigated. The phage has a lambdoid morphology and is somewhat larger than lambda. A variety of factors which affect phage stability have been investigated. The bacteriophage infects several of the strains that have been tested. Study of this bacteriophage should greatly increase our understanding of genetic mechanisms in Acidiphilium. 23 refs., 3 figs., 1 tab.

43577 Production of foods, food additives and feeds from biomass by microbiological processes. Litchfield, J.H. (Battelle-Columbus Labs., Columbus, OH (US)). vp. of Biomass conversion technology. Moo-Young, M. Pergamon Books Inc., Elmsford, NY (1987).

Availability and cost of n-alkane substrates was a significant factor in the commercial failure of the British Petroleum and the Kanegafugi Chemical Industry Co. processes for large scale production of Candida spp. for use in animal feeds. Regulatory problems associated with hydrocarbon residues in the final microbial protein products were also a problem in these processes. In contrast, biomass resources including agricultural, food processing waste and forestry products and their wastes are attractive low-cost sources of carbohydrate raw materials for producing foods, food additives and feeds by microbiological conversion processes. This discussion covers developments in the production of food and feed-grade microbial protein products (single cell proteins) and selected food additives from biomass-derived carbohydrates by nonphotosynthetic microorganisms including actinomycetes, bacteria, molds, yeasts, and higher fungi.

43578 (PB–89-182042/XAB) **Development and validation of methods for sampling and analysis of workplace toxic substances. Research report.** Gunderson, E.C.; Anderson, C.C.; Smith, R.H.; Doemeny, L.J. SRI International, Menlo Park, CA (USA). Sep 1980. 60p. Available from NTIS, PC A04/MF A01.

Methods for sampling and analyzing 130 toxic workplace substances were evaluated. Analytical methods were developed and tested for the toxic substance. The sensitivity and specificity of the method were evaluated and the response to known interferences was determined. An appropriate sample-collection medium was chosen and spiked with known amounts of the test substance. An efficient recovery procedure was developed. The analytic recovery of the substance from the sampling medium was then determined and the precision was evaluated. The efficiency of the sampling procedure with known air concentrations of the toxic substance was tested.

43579 (AECL–9062) **Preservation of fish and fish products by use of ionizing radiation. A literature review.** Chuaqui-Offermanns, Noemi. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Sep 1986. 56p. Order Number DE89635240/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

This report reviews the use of the radurization process in the preservation of fish and fish products. The literature describes several aspects of the process such as the fish species and the doses required, the wholesomeness of the radurized fish, and recommendations by international authorities on the applicability of the process. Areas of further research have been identified. The report concludes that radurization is an effective process for extending the shelf life of fish and fish products. Doses ranging from 0.75 to 2.5 kGy extend the shelf life two to three times compared to unirradiated controls. The loss of nutritional value at these doses is insignificant, and no deleterious short- or long-term toxicological effects have been detected in studies on animals. However, further study is required on consumer acceptance, economic feasibility, and radiation sensitivity of parasites in fish and fish products. 159 refs.

43580 (AECL–9081) **Insect pests of stored grain products. A review.** Chuaqui-Offermanns, N. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. 1987. 78p. Order Number DE89635241/JAW. Available from NTIS (US Sales Only), PC A05/MF A01 - OSTI; INIS.

The presence of insects in stored products is a worldwide recognized problem. In this report chemical and physical methods to control insect infestations in stored products are discussed. Special attention is given to the use of ionizing radiation to control insect pests in stored grains. The radiosensitivity of the most common insect pests at their different developmental stages is presented and discussed. The conclusions of this review are compiled in an executive summary. 62 refs.

43581 (IAEA-TECDOC–490, pp. 77-94) **Regulatory control of food irradiation processes.** Engel, R.E. (Department of Agriculture, Washington, DC (USA). Food Safety and Inspectione Service); Derr, D.D. International Atomic Energy Agency, Vienna (Austria). Jan 1989. (CONF-8804282–: Task force meeting on public information of food irradiation, Cadarache (France), 18-21 Apr 1988). In *Safety factors influencing the acceptance of food irradiation technology. Report of a task force meeting on public information of food irradiation convened by the International Consultative Group on Food Irradiation and held in Cadarache, France, 18-21 April 1988.* Order Number DE89619871/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

Ionizing radiation has a long history of successful use in treating a variety of nonfood products, but its application to foods is a new challenge. In order to meet this challenge, regulatory requirements and standards for the irradiation treatment of foods are needed. Many countries have already established rules and protocols for the use of ionizing radiation on a variety of food products and the food industry has recognized the need for standards for the irradiation treatment of foods, in many cases more stringent than those applied for other processes. While standardization and control of the irradiation process are imperative for its proper application to food, they are not the parameters that will govern the successful implementation and acceptance of food irradiation. The technology will be successful only if the public accepts it as a safe and useful process. Recent surveys show that dissemination of accurate and complete facts about irradiation is a key to public education about the technology. The United States Department of Agriculture (USDA) agrees that public information is important and, while it feels that industry must play the primary role, it is participating in several public information activities. Many U.S. government agencies are involved in food irradiation, protecting the public from hazards associated with ionizing radiation technology, monitoring the safety and wholesomeness of the food supply, and developing and transferring the technology to the private sector. There are only a few approved uses of food irradiation in the U.S. at the present time and very little food is being processed using the technology. The regulatory agencies are requiring proper labeling and packaging, and effective quality control systems as prerequisites for the use of irradiation. Methods for detecting if a food has been irradiated are also under development.

43583 (INIS-mf–11503, pp. 121-124) **Radiation sterilization. Modification of radiation response of bacillus pumilus spores in antibiotic powders.** Jacobs, G.P. Israel Nuclear Society, Yavne (Israel). Mar 1989. (CONF-8903152–: Nuclear Societies of Israel annual meeting, Beer-Sheva (Israel), 13 Mar 1989). In *Annual Meeting 1989.* Order Number DE89012204/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Transactions.; V. 15.

In view of the application of ionizing radiation to sterilize pharmaceutical products, and the particular advantages of using this mode of sterilization for powders for injection, which cannot be sterilized by more conventional methods, it is important to recognise the possibility of modification of radiation response of bacteria when in close contact with various drug powders. For this study, bacterial spores, which lend themselves to dessication, and which can be dried onto an inert powder matrix, were chosen as the test system. The results of this work indicate that the additives tested have a modest protective effect on the spores. However, when considering a bacterial inactivation for sterilization purposes of between six and ten orders of magnitude, that is, a desired sterility assurance level of an expected maximum probability of a product item being nonsterile of 10^{-6}, then the slight protective effect observed in this study approaches insignificance.

43584 (Juel–2253) **Uptake of [^{14}C]triadimenol via grain and root after seed treatment of winter barley with a flowable seed dressing: Influence of soil moisture and sowing date on the distribution of radioactivity and active ingredient content in plant and soil.** Schneider, M. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Radioagronomie; Bonn Univ. (Germany, F.R.). Dec 1988. 207p. (In German). Order Number DE89911078/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

Winter barley seed of the 'Vogelsander Gold' variety was shown in a total of 7 lysimeters after seed treatment with [benzene ring-U-^{14}C]triadimenol in the formulation as [^{14}C]Baytan 075 FS and [^{14}C]Baytan 25 DS at an early (September) and a late date (October). After both dates of sowing, the FS-treated winter barley developed under 3 different soil moisture conditions. The radioactivity and active ingredient contents in plants and soil were recorded until tillering as a function of low, high and natural precipitation after sowing. Details on the uptake of radioactivity via grain and roots were quantitatively and qualitatively studied in two further lysimeters, a pot experiment as well as experiments in the growth chamber. The results are presented and discussed in detail. (orig./MG).

43585 (NIRS-RSD–83) **Radioactivity survey data in Japan, part 2. Dietary materials.** National Inst. of Radiological Sciences, Chiba (Japan). Oct 1988. 38p. Order Number DE89906612/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The report presents data obtained through a radioactivity survey, various environmental and dietary materials are collected for analysis. Rain and dry fallout are collected monthly. Airborne dust is collected every three months. Service water samples are taken semiyearly at the intake of watertreatment plants and at the tap. Freshwater is taken once a year (fishing season). Soil samples are collected once a year from two layers at different depths. Sea water is collected once a year at fixed stations where the effect of terrestrial fresh water from rivers is expected to be negligible. Sea sediments are collected once a year in the same area as that for the sea water sample. A full one day ordinary diet including three meals, water and tea for five persons is collected semiyearly as a sample of 'total diet'. Polished rice is collected in producing districts and in consuming areas. Raw milk is collected in producing districts and commercial milk is purchased in consuming districts. Vegetable are collected semiyearly in producing and consuming districts. Tea samples are also collected semiyearly. Fish, shellfish and seaweeds are collected once a year. Test solutions are prepared from these samples. Strontium-90 and cesium-137 are separated and subjected to quantitative determination. Results obtained are tabulated. (N.K.).

43586 (AD-A–205803/0/XAB) **Characterization of radiation-induced emesis in the ferret.** King, G.L. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 15p. (AFRRI-SR–88-41). Available from NTIS, PC A03/MF A01.

Pub. in Radiation Research, Vol. 114, 599-612(1988).

Forty-eight ferrets (Mustela putorius furo) were individually head-shielded and radiated with bilateral cobalt 60 gamma radiation at 100 cGy min at doses ranging between 49 and 601 cGy. The emetic threshold was observed at 69 cGy, the ED 50 was calculated as 77 cGy, and 100% incidence of emesis occurred at 201 cGy. With increasing doses of radiation, the latency to first emesis after radiation decreased dramatically, whereas the duration of the prodromal period increased. Two other sets of experiments suggest that dopaminergic mechanisms play a minor role in radiation-induced emesis in the ferret. Twenty-two animals were injected either intravenously or subcutaneously with 30 to 300 micrograms /kg of apomorphine. Fewer than 50% of the animals vomited to 300 micrograms/kg apomorphine; central dopaminergic receptor activation was apparent at all doses. Another eight animals received 1 mg/kg domperidone prior to either 201 (n=4) or 401 (n=4) cGy radiation and their emetic responses were compared with NaCl-injected-irradiated controls (n=8). At 201 cGy, domperidone significantly reduced only the total time in emetic behavior. At 401 cGy, domperidone had no salutary effect on radiation-induced emesis. The emetic responses of the ferret to radiation and apomorphine are compared with these responses in other vomiting species.

43587 (AD-A–205804/8/XAB) **Tethered-restraint system for blood collection from ferrets.** Jackson, R.K.; Kieffer, V.A.; Sauber, J.S.; King, G.L. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). Oct 1988. 5p. (AFRRI-SR–88-40). Available from NTIS, PC A02/MF A01.

Pub. in Laboratory Animal Science, Vol. 38, No. 5, 625-628(Oct 1988).

The laboratory ferret, Mustela putorius furo, recently has come into prominence as a laboratory animal for use in biomedical research. This laboratory has adopted the use of this species because the ferret's emetic response to radiation occurs at a lower dose and has a more rapid onset than that of dogs. One approach for determining the physiological basis of this response is to measure serum levels of various circulating substances before and after irradiation. However, blood collection from the ferret can be difficult because the lack of easily accessible veins and seasonal accumulation of subcutaneous body fat. This report describes a method of tethered-restraint for the ferret in which an in-dwelling venous jugular catheter is implanted for withdrawing blood samples. No interference with the animal's normal activities occurs during the sampling procedure. Each animal is conditioned to the tethered-restraint prior to surgical placement of the catheter. The technique provides a minimally stressful method of restraint. A similar tethering system has been used successfully on several other animal species, such as non-human primates and rats.

43588 (AD-A–205805/5/XAB) **Attenuation of a radiation-induced conditioned taste aversion after the development of ethanol tolerance.** Hunt, W.A.; Rabin, B.M. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 9p. (AFRRI-SR–88-39). Available from NTIS, PC A02/MF A01.

Pub. in Life Sciences, Vol. 43, 59-66(1988).

An attempt to reduce a radiation-induced conditioned taste aversion (CTA) was undertaken by rendering animals tolerant to ethanol. Ethanol tolerance, developed over 5 days, was sufficient to block a radiation-induced taste aversion, as well as an ethanol-induced CTA. Several intermittent doses of ethanol, which did not induce tolerance but removed the novelty of the conditioning stimulus, blocked an ethanol-induced CTA but not the radiation-induced CTA. A CTA induced by doses of radiation up to 500 rads was attenuated. These data suggest that radioprotection developing in association with ethanol tolerance is a result of a physiological response to the chronic presence of ethanol not to the ethanol itself.

43589 (AD-A–205806/3/XAB) **Effect of PGE2 on radiation response of chinese hamster V79 cells in vitro.** Holahan, E.V.; Blakely, W.F.; Walden, T.L. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1987. 11p. (AFRRI-SR–88-38). Available from NTIS, PC A03/MF A01.

Pub. in Prostaglandin and Lipid Metabolism in Radiation Injury, 253-262(1987).

Several recent investigations have reported that 16,16-dimethyl prostaglandin E2 (DiPGE2) can protect murine intestinal epithelial cells and hematopoietic stem cells (CFU-S) in vivo from ionizing radiation. It has been postulated that PGE2 may also increase radiation resistance in vitro by stimulating free-radical scavenging or repair systems for oxidative damage. This study reports on the effect of PGE2 in modifying radiation sensitivity in an in vitro mammalian cell line. Chinese hamster V79A03 cells were cultured. Exponentially growing cells were incubated before exposure to graded doses of 250-kVp X rays. Cells were assayed for variations in intracellular levels of cyclic 3',5'-adenosine monophosphate (cAMP), total protein, and glutathione (GSH), and radiation sensitivity was measured by cell survival before and after PGE2 treatment. An acute (2-hr) exposure induced a 25% increase in cAMP content with no significant change in intracellular GSH or protein and no effect on cell survival after exposure to radiation. Chronic exposure to PGE2 increased intracellular GSH, protein, and cAMP levels by 82%, 3%, and 74%, respectively. However, no increase in radiation resistance was apparent following chronic exposure to PGE2. The increased radiation resistance observed in vitro may be due to modifications such as localized tissue or organ-system hypoxia.

43590 (AD-A-205807/1/XAB) **Flow-cytometry techniques in radiation biology.** McCarthy, K.F.; Hale, M.L. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 16p. (AFRRI-SR-88-42). Available from NTIS, PC A03/MF A01.

Pub. in Toxicology Letters, Vol. 43, 219-233(1988).

Considerable evidence exists that all blood cells are derived from HSC. These cells are of interest to radiobiologists because they are highly sensitive to low doses of ionizing radiation. Hematopoietic stem cells (HSC) are present in the marrow at a concentration of approximately 2-3 HSC per 1000 nucleated marrow cells. In the past, only clonogenic assays requiring 8-13 days and ten irradiated recipient rodents were available for assaying HSC. Because of the importance of HSC in the post-irradiation syndrome, the authors developed a new rapid method based on flow cytometry not only to assay but also to purify and characterize HSC. This new method makes extensive use of non-clonal antibodies conjugated to fluorescent phycobiliproteins through the sulfhydryls of the hinge region of the IgG molecule. An optical bench arrangement with a dye laser and an argon laser was used for dual excitation of the phycobiliprotein-monoclonal antibody conjugates and various cellular and DNA probes. Using 4', 6-diamidino 2-phenylindole dihydrochloride (DAP) exclusion to identify viable cells, it was possible to follow regeneration of post-irradiated rat marrow HSC.

43591 (AD-A-205810/5/XAB) **Recovery of hematopoietic colony-forming cells in irradiated mice pretreated with interleukin 1 (IL-1).** Schwartz, G.N.; Neta, R.; Vigneulle, R.M.; Patchen, M.L.; MacVittie, T.J. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 8p. (AFRRI-SR-88-46). Available from NTIS, PC A02/MF A01.

Pub. in Experimental Hematology, Vol. 16, 752-757(1988).

Data in this report determined the effect of a single injection of recombinant interleukin 1 a (rIL-1) prior to irradiation of B6D2F1 mice on the recovery of colony-forming cells (CFC) at early and late times after sublethal and lethal doses of radiation. Injection of rIL-1 promoted an earlier recovery of mature cells in the blood and CFC in the bone marrow and spleen. For example, 8 days after 6.5-Gy irradiation, the number of CFU-E (colony-forming units erythroid), BFU-E (burst-forming units-erythroid), and GMCFC (granulocyte-macrophage colony-forming cells) per femur was approximately 1.5-fold higher in rIL-injected mice than in saline-injected mice. Also, 5, 9, and 12 days after irradiation, the number of both day 8 and day 12 CFU-S (colony-forming units-spleen) was almost twofold greater in bone marrow from rIL1-injected mice. The earlier recovery of CFU-S in rIL-1 injected mice was not associated with an increase in the number of CFU-S that survived immediately after irradiation. Also, 7 months after irradiation, the number of CFU-S per femur of both saline-and rIL-1 injected mice was still < 50% of normal values. Data in this report demonstrate that a single injection of rIL-1 prior to irradiation accelerates early hematopoietic recovery in irradiation mice, but does not prevent expression of radiation-induced front-end damage damage to hematopoietic tissues.

43592 (AD-A-205812/1/XAB) **Radiation-induced impairment of neuronal excitability.** Pellmar, T.C.; Tolliver, J.M.; Neel, K.L. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 12p. (AFRRI-SR-88-45). Available from NTIS, PC A03/MF A01.

Pub. in Comments Toxicology, Vol. 2, No. 4, 253-263(1988).

Radiation causes a decrease in the synaptically evoked activity of CA1 hippocampal pyramidal cells. This effect is dose and dose-rate dependent. Hydrogen peroxide, which produces hydroxyl free radicals when combined with FE + 2, produces similar damage. In contrast, the radioprotectant, dithiothreitol, increases the excitability of hippocampal neurons. These studies indicate that radiation can directly affect the function of central neurons.

43593 (AD-A-205813/9/XAB) **Comparison of in vivo effects of human recombinant IL 1 and human recombinant IL 6 in mice.** Neta, R.; Vogel, S.N.; Sipe, J.D.; Wong, G.G.; Nordan, R.P. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 11p. (AFRRI-SR-88-44). Available from NTIS, PC A03/MF A01.

Pub. in Lymphokine Research, Vol. 7, No. 4, 403-412(1988).

Interleukin 1 and Interleukin 6 share a number of biological activities, including induction of fever, neutrophilia and acute phase response, and IL 1 induces IL 6 production by fibroblasts and macrophages. Therefore, it was proposed that IL 6 mediates many of the activities of IL 1. To test this hypothesis in vivo, the authors assessed induction of IL 6 following IL 1a administration to mice and tested IL 6 for radioprotection and induction of early (CSF) and late (fibrinogen and SAA) acute phase reactants. Unlike IL 1 which is radioprotective when administered in doses above 100 ng/mouse, doses of 10-1000 ng/mouse of human recombinant IL 6 did not result in increased survival of mice following lethal irradiation. Such treatment given 20 hrs before LD 50/30 doses of radiation resulted in reduced survival of mice. However, IL 6 augmented the radioprotective effect of IL 1. IL 1 in doses above 10 ng/mouse induced within 2 to 6 hrs a dose-dependent increase in CSF in circulation, but IL 6 did not induce detectable levels of CSF at 2, 6 and 20 hrs after administration. Administration of IL 6 to mice produced a dose-dependent increase in circulating fibrinogen and SAA. Similarly, administration of IL 1 resulted in much greater increases in levels of fibrinogen and SAA. Therefore, IL 1 is a more-effective inducer of fibrinogen and SAA in mice than is IL 6.

43594 (AD-A-205814/7/XAB) **Effects of sublethal doses of ionizing radiation on schedule-controlled performance in rats.** Mele, P.C.; Franz, C.G.; Harrison, J.R. Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). 1988. 9p. (AFRRI-SR-88-43). Available from NTIS, PC A02/MF A01.

Pub. in Pharmacology Biochemistry and Behavior, Vol. 30, 1007-1014(1988).

Male rats responded under a fixed-ratio (FR) 50 or a fixed-interval (FI) 120-sec schedule of milk delivery. Separate groups were acutely exposed to 0.5, 1.5, 4.5, or 0 (FI only) Gray (Gy) of cobalt-60 gamma radiation 3 times at 43-day intervals. All rats received an acute dose of 6.5 Gy 64 days after the last of these exposures. One-half and 1.5 Gy did not alter FR or FI performance significantly. After 4.5 Gy, no observable changes in performance occurred within 1 hr of exposure. Maximal reductions in FR response rates occurred 24 hr after exposure and recovery followed over the subsequent 72 hr. Post-reinforcement pause was increased and running response rate was decreased by 4.5-Gy. Similar effects were found after each 4.5-Gy exposure. In contrast, FI performance (overall response rate, post-reinforcement pause, running response rate, index of curvature) was not altered reliably by 4.5-Gy. Both FR and FI response rates were reduced by 6.5 Gy beginning 24 hr after exposure; FR rates tended to be reduced more than FI rates 24-72 hr after exposure. Response rates under both schedules recovered gradually over 7 weeks. The behavioral effects of 6.5 Gy did not vary as a function of irradiation history. In contrast, irradiation history affected survival in that 4/9 rats previously exposed to 4.5 Gy died during weeks 4-5 after 6.5 Gy, whereas there were no deaths in the rats previously exposed to lower doses. Radiogenic disruption of operant performance was dose-related, reversible, non-cumulative, and dependent on the schedule of reinforcement.

43595 (AD-A-205818/8/XAB) **Biological evaluation of radioprotective drugs. Final report, 1 February 1986-30 September 1988.** Murray, D. Anderson (M.D.) Cancer Center, Houston, TX (USA). 1 Nov 1988. 54p. Available from NTIS, PC A04/MF A01.

The cellular and molecular mechanisms of radioprotection by aminothiols were investigated through the use of cultured mammalian (CHO) cells and a whole-animal model, specific-pathogen free mice. For each of these systems, detailed structure-activity relationships were determined relating the effects of the different drugs on various endpoints for the survival of clonogenic cells and on the induction and repair of several types of DNA lesions in these same cells. The data with cultured cells were used as a means of understanding or predicting the effects of the phosphate-blocked derivatives of these thiols on tissues. The major finding from the in vitro studies is the fact that the modulation of cell survival and DNA double-strand break induction correlates closely for a series of structurally-different thiols and aminothiols. The in vivo studies suggest that tissue oxygenation plays an important role in determining both the extent and mechanism of protection, and that understanding the interrelationships between oxygen, aminothiols and radiation sensitivity will be a crucial step in the ability to utilize such drugs effectively.

43596 (AD-A-206531/6/XAB) **AFRRI (Armed Forces Radiobiology Research Institute) reports, October, November, December 1988. Technical report.** Armed Forces Radiobiology Research Inst., Bethesda, MD (USA). Oct 1988. 200p. Available from NTIS, PC A09/MF A01.

Set Includes Rept. nos. AFRRI-SR88-30 through AFRRI-SR88-49.

This volume contains AFRRI Scientific Reports SR88-30 through SR88-49 for Oct-Dec 1988.

43597 (DOE/ER/60531–1) **Screening models to predict food-chain transfer of environmental toxicants: Final report.** Johnson, J.E.; Ward, G.M. Colorado State Univ., Fort Collins, CO (USA). 31 Mar 1989. 22p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER60531. Order Number DE89016448/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The objectives of the research effort were to determine transfer coefficients to milk, beef, eggs, and poultry meat of six radionuclides for which transfer coefficients were either undetermined or based upon secondary data. The radionuclides were isotopes of Tc, Mo, Te, Ba, Zr, and Nb. In addition, ^{131}I was used in experiments with hens to determine egg and poultry meat transfer coefficients. The new information on transfer coefficients obtained during this project indicates that, in some cases, lower values are appropriate and that those currently in use may provide an overestimate of the risks to man from the animal food chain. The objective of the second phase of this research was to provide information to clarify the physiological parameters that control transfer of radionuclides to animal food products. The data from the first phase has been published but this data has not appeared in the literature and thus is presented here in some detail. 10 refs., 4 figs., 6 tabs.

43598 (ENEA-RT-DISP–88-03) **Radioecological survey in a North-Eastern Italian region (Chernobyl accident).** Belli, M.; Blasi, M.; Borgia, A.; Desiato, F.; Poggi, M.; Sansone, U.; Menegon, S.; Nazzi, P. ENEA, Rome (Italy). Direzione Sicurezza Nucleare e Protezione Sanitaria. Sep 1988. 28p. (In Italian). Order Number DE89761961/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

This paper presents the first results of a radioecological survey of the agricultural environment in the North-Eastern region of Italy (Friuli- Venezia Giulia) following the Chernobyl accident. An analysis is made of the selection criteria for 35 sampling stations, selected on the basis of a soils study. Reported are the following: the Cs-137 deposition map of the investigated area; the Cs-137 w-sh-out; the influence of the agricultural practices on the dispersion of radionuclides in soils; the Cs-137 soil-maize transfer factors.

43599 (ENEA-RT-PAS–85-17) **Tritium metabolism in the human body.** Belloni, P.; Breuer, F.; Clemente, G.F.; Di Pietro, S.; Ingrao, G. Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipt. Protezione Ambiente e Salute dell'Uomo; ENEA, Rome (Italy). Direzione Sicurezza Nucleare e Protezione Sanitaria. 1985. 12p. Order Number DE89762003/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Current models for dose calculation following tritium intake assume that the tritium metabolism in the human body is the same as that for body water. Consequently, the dose contribution due to a possible presence of an organically bound tritium fraction having a retention time longer than that of aqueous tritium may be heavily underestimated. In order to evaluate a realistic metabolic model in man, tritium was measured, both in the organic bound fraction and in the loose water fraction, in complete daily diets, single food items, urine, blood and various autopsy samples collected from subjects representative of the normal Italian population exposed to the equilibrium conditions characterized by tritium fallout exposure. The results of such measurements showed a significant presence of organically bound tritium, both in foodstuffs and in human tissues. A metabolic model, which takes into account both the water and organic tritium fraction in the body, was developed to fit the experimental data.

43600 (ENEA-RT-PAS–85-20) **Fallout tritium levels in environmental and biological samples in Italy.** Belloni, P.; Clemente, G.F.; Di Pietro, S.; Ingrao, G. Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Dipt. Protezione Ambiente e Salute dell'Uomo. 1985. 6p. Order Number DE89762002/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

This paper describes analytical methods for the determination of low levels of tritium, both in aqueous and organically bound fractions, and of trace elements in human tissue. Organically bound tritium is determined by means of the liquid scintillation technique in which the oxidation water, obtained by the combustion of a small aliquot of the lyophilized sample, is measured. The same technique is used to determine tritium in the loose fraction. The instrumental neutron activation analysis is used for the determination of the trace elements. Preliminary data on a small number of samples are reported.

43601 (ENEA-RT-PAS–88-21) **Whole body counting in Italy (1987) after Chernobyl: Cs-137 and Cs-134 intake.** Melandri, C.; Castellani, C.M.; Tarroni, G.; Formignani, M. Comitato Nazionale per l'Energia Nucleare, Bologna (Italy). Oct 1988. 79p. (In Italian). Order Number DE89761992/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

Internal contamination data, obtained during 1987 at the ENEA PAS-FIBI-AEROSOL Laboratory in Bologna, after the Chenobyl accident, are presented. The data refer to persons living in the Bologna area, in other Italian regions and to individuals returning from abroad, mainly from Eastern Europe countries. Trends of Cs-137 and Cs-134 internal body burden in adult men resident in Bologna are given together with values of mean daily intake by ingestion and the committed dose equivalents up to december 1987 are evaluated. The measurement campaigns were specifically designed to evaluate male/female activity differences and the distribution of internal contamination levels in various Italian regions.

43602 (FS–88-47-T) **Non-ionizing radiation. Proceedings.** Fachverband fuer Strahlenschutz e.V., Karlsruhe (Germany, F.R.). Nov 1988. 237p. (In German). (CONF-8811249–: 21. annual meeting of Fachverband fuer Strahlenschutz e.V: Non-ionizing radiation (NIR), Koeln (Germany, F.R.), 7-9 Nov 1988). Order Number DE89795711/JAW. Available from NTIS (US Sales Only), PC A11/MF A01.

The technical papers deal with health hazards from radiation, rules for the prevention of accidents, the risk of cancer and radiation effects, as well as the international standardization of UV, light, IR, LASER, static and low-frequency fields, electromagnetic fields, cardiac pacemakers, infrasound, ultrasound, and visual display units. (DG).

43603 (FS–88-47-T, pp. 203-212) **Aspects of radiation effects due to visual display units at work.** Vana, N. (Atominstitut der Oesterreichischen Universitaeten, Vienna). Fachverband fuer Strahlenschutz e.V., Karlsruhe (Germany, F.R.). Nov 1988. (In German). (CONF-8811249–: 21. annual meeting of Fachverband fuer Strahlenschutz e.V: Non-ionizing radiation (NIR), Koeln (Germany, F.R.), 7-9 Nov 1988). In *Non-ionizing radiation. Proceedings.* Order Number DE89795711/JAW. Available from NTIS (US Sales Only), PC A11/MF A01.

The introduction and acceptance of video display units at work have led to a huge flood of information, rumours, and half-truths about those units. As the population became increasingly sensitized to 'radioactive radiation', there was, and in part still is, a tendency to consider particularly effects of unclear origin, first of all ionizing radiation and later on also non-ionizing radiation, as the main threat from video display units at work. Such important issuses as ergonomics, stress load, visual stress load, and social hygiene are often effaced by the question for 'the radiation load from visual display units'. The paper is an attempt to deal with aspects of radiation effects of visual display units at work. The discussion also extends to hazards, respectively the 'radiation environment', at the site of the visual display unit. (orig./DG).

43604 (INIS-mf–11478) **Radiation protection in the application of ionizing radiation in industry.** Mohamad Yusof Mohamad Ali. Unit Tenaga Nuklear, Bangi, Selangor (Malaysia). 1987. 10p. (CONF-8711314–: Seminar on the application of nuclear techniques in industry, 17 Nov 1987). Order Number DE89635218/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI.

There is a substantial increase in the use of ionizing radiation in industry throughout the country especially in the last five years or

so. With this growth in the number of users and activity of sources used, and together with the introduction of the new Atomic Energy Licensing Act (AELA) in 1984, the question of radiation safety and protection of workers and members of the public in general, can no longer be taken lightly. It has to be dealt with effectively. In this paper, a general discussion and clarification on certain practical aspects of radiation protection as recommended by the International Atomic Energy Agency (IAEA) is presented. Amongst the topics chosen are those on area monitoring, personnel monitoring, leak testing of sealed sources and training of personnel. Also presented in the paper is a brief discussion about UTN's experience in giving out radiation protection services to various agencies throughout the country. (author).

43605 (INIS-mf-11503, pp. 14-15) **Estimation of trace elements in organs of mice. Effect of selenite on the toxicity of Cis-DDP.** Schenberg, C. (Israel Atomic Energy Commission, Yavne (Israel). Soreq Nuclear Research Center); Izak-Biran, T.; Mantel, M.; Rachmiel, B.; Weininger, J. Israel Nuclear Society, Yavne (Israel). Mar 1989. (CONF-8903152–: Nuclear Societies of Israel annual meeting, Beer-Sheva (Israel), 13 Mar 1989). In *Annual Meeting 1989.* Order Number DE89012204/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.
Transactions.; V. 15.
Summary only.

43606 (ISH–117) **The diaplacental transfer and teratogenicity of tritium in organic compounds.** Kistner, G.; Wiggenhauser, A.; Krestel, R. Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene; Bundesministerium des Innern, Bonn (Germany, F.R.). Oct 1987. 127p. (In German). Contract BMI St.Sch. 716e. Available from Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

In the introductory section of this report the relevant literature on the environmental prevalence of tritium, its uptake and distribution in the organisms as well as on the calculation of tritium-related exposure risks is reviewed in brief. The literature study as well as recent workshops on tritium (as e.g. in Karlsruhe, 1986) emphasize the role of organically bound tritium in the assessment of tritium-related radiation exposure. (orig./MG).

43607 (ISH–121) **The influence of radiation treatment on pharmaceuticals and adjuvants. A literature study. Pt. 8. Summary and review of parts 1-7.** Zalewski, C.; Schuettler, C.; Boegl, K.W. Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene. Mar 1988. 437p. (In German). Available from Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene.

The 8th last volume is a summary and review of results from 467 experimental irradiations of 311 substances (based on 134 different sources) discussed in the previous seven volumes. This report is initially introducing a review list of the substances examined in the previous seven volumes. Further data are given on primary literature source. An alphabetical listing of standardized descriptions used in this report is furthermore presented. A list of substances per substance group and a list of substances per reference source are both added. In the results from individual substance groups, a so-called text evaluation is first providing a general review of results from the respective substance group prior to discussing the individual substances. In the summarizing list of each substance group, data are tabulated in reference to irradiation conditions, examining methods and substance decay. The subsequent excerpt from the summarizing list of the respective substance group is compiling the results. All results are compiled in comparison to the decay from irradiation in form of solid substance or aqueous solution; and likewise the effects from a sodiumpyrosulphide additive on the decay of aqueous solutions in comparison to solutions without additives. This is followed by a comparison of decay from radiosterilization and heat sterilization. The report is concluded by a summary of results from investigations on the toxicity of irradiated pharmaceuticals. (orig./MG).

43608 (KFK–4576) **General recommendations for decontamination procedures to individuals.** Ohlenschlaeger, L.; Messerschmidt, J.P. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Medizinische Abt. Apr 1989. 38p. (In German). Order Number DE89911094/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The fundamental criteria in handling radioactive contaminated persons are discussed and methods of monitoring, including monitoring of contaminated wounds, as well as decontamination measures with reference to particularly exposed regions of the body are described. Each decontamination procedure has to be carried out cautiously and has to be stopped as soon as skin lesion would be ensured from too strong mechanical cleansing, in order to avoid any additional incorporation by an injured skin. As a rule, any residual radioactivity still adherent to the skin surface can be neglected as soon as avoidance of spreading of the contamination to surrounding areas is assured. Experience showed that contaminations with radioactive dust can be removed from the skin surface quite easily by such simple means like water and soap. Radioisotopes, however, as used in nuclear medicine, usually are having a higher adhesive effect to the skin surface, thus making conditions for decontamination more difficult. Measures related to the decontamination procedure such as monitoring, mode of sampling for bioassay in case of incidents, handling of waste resulting from decontamination, as well as self-protective aspects are discussed in the annex. (orig.).

43609 (PNL–6500-Pt.4, pp. 30) **Low-energy electron microdosimetry.** Wilson, W.E.; Miller, J.H.; Straume, T. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

For the purpose of evaluating the dosimetry of continuum photon irradiation of oocytes, we have developed a low-energy (secondary) electron transport (Monte Carlo) code by adapting portions of MOCA14. The code allows an isotropic but otherwise arbitrary source spectrum up to 100 keV. Between primary energies of 10 and 100 keV, a straight-ahead approximation is assumed. The simulated oocyte target components are a spherical nucleus of 5 μm diameter concentric with a 6-μm-diameter cell enclosed by a 100-nm-thick membrane. This target is irradiated isotropically by a continuum spectrum calculated (by LLNL) for a 250 kVP x-ray source. For reasons of computer economy the source domain is restricted to less than the maximum range of the most energetic electron. Domains of 20 and 40 μm are being compared for variance from electronic equilibrium. Correlated single-event distributions are obtained for simultaneous energy deposition in the nucleus and in the surrounding cell membrane. Preliminary results indicate that a significant fraction of the single events in the nucleus are accompanied by little or no energy deposition in the membrane.

43610 (PNL–6500-Pt.4, pp. 31-32) **Modeling free radical yields in DNA exposed to high-LET radiation.** Miller, J.H.; Wilson, W.E.; Swenberg, C.E. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Experiments performed at the Armed Forces Radiobiology Research Institute (AFRRI) with samples of oriented DNA exposed to neutrons suggest that free-radical yields depend upon the orientation of DNA molecules relative to the recoil proton flux. We have developed a model for this effect based on Monte Carlo simulation of the pattern of energy deposition in DNA by protons slowing down in the sample and assuming more rapid migration of energy along DNA chains than between DNA molecules.

43611 (PNL–6500-Pt.4, pp. 37-38) **Irradiation of biological systems by monoenergetic neutrons.** Metting, N.F.; Braby, L.A.; Middendorf, M.E. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

The importance of understanding the relative biological effectiveness (RBE) of neutrons, especially for low dose-rate neutron exposures, has encouraged us to re-evaluate the use of our 2-MV positive ion Van de Graaff accelerator to generate monoenergetic neutrons for use in radiobiological studies. We have obtained dose response curves for both C3H mouse 10T1/2 and mouse L cell

lines as a first step in developing assays of non-lethal end points. A preliminary experiment in which plateau-phase 10T1/2 cells were irradiated with 0.35 Gy of 1.4-MeV neutrons shows a transformation frequency per surviving cell of about 1.2×10^{-4}. This value is slightly lower than the value measured in the same cell line irradiated with JANUS reactor neutrons.

43612 (PNL–6500-Pt.4, pp. 39-41) **Interpreting survival observations using phenomenological models.** Nelson, J.M.; Braby, L.A.; Metting, N.F.; Roesch, W.C. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

The authors have performed experiments to test various competing biophysical models using split-dose, delayed-plating, and low-dose-rate methods. Most ionizing radiation damage appears to be rapairable, but the nature and consequences of the initial unrepaired damage remain uncertain. Saturation models assume only lethal or potentially lethal damage (damage capable of killing the cell unless it is repaired). The accumulation models are based on the assumption that some fraction of the damage is not necessarily lethal or potentially lethal, but sublethal (innocuous damage which can become lethal only after interaction with additional sublethal damage).

43613 (PNL–6500-Pt.4, pp. 42-43) **Modification of damage following low doses.** Braby, L.A.; Nelson, J.M.; Metting, N.F. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

At very low doses the damage-interaction mechanism is responsible for very little lethal or potentially lethal damage, and repair of the latter should essentially disappear. An alternative model suggests that potentially lethal damage is either repaired with a constant half time or misrepaired at a rate which is proportional to the square of the damage concentration. In this case, as the dose decreases, the probability of misrepair decreases faster than the probability of repair, and repair becomes a more pronounced feature of the cell response. Since the consequence of unrepaired damage is an important question in determining the effects of low doses of radiation delivered at low dose rates, we have attempted to determine which of these two types of models is consistent with the response of plateau-phase CHO cells. In the earlier experiments, there was no indication of repair after a 50-rad exposure with a 24-hour split dose or plating delay; in fact, immediate plating resulted in survival slightly above control and delayed plating in survival slightly below the control value.

43614 (PNL–6500-Pt.4, pp. 45-47) **Multiple split-dose repair in plateau-phase mammalian cells.** Nelson, J.M.; Braby, L.A.; Metting, N.F. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Repair of ionizing radiation damage is observed either as the time-dependent removal of radiation-induced alterations in cellular constituents or as changes in the probability of survival of individual cells. The removal of macromolecular alterations is suggestive of mechanisms leading to changes in cell survival probability and several such processes have been observed in bacteria. However, even though each has its own characteristic repair rate and other distinguishing characteristics, it has proved difficult to demonstrate unambiguous links between these processes and changes in reproductive integrity leading to the observable enhancement of cell survival. Changes in survival probability are observed in split-dose and delayed-plating (or liquid-holding) experiments. These changes are certainly responsible for the shoulder observed in dose-response curves and for what we refer to as the dose-rate effect.

43615 (PNL–6500-Pt.4, pp. 49-50) **Radiation damage repair by subpopulations of stationary-phase CHO cells separated by centrifugal elutriation.** Nelson, J.M.; Metting, N.F.; Braby, L.A. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

The sensitivity of cells to radiation is strongly dependent on the position of the cells within the cell cycle. Since tissues and organs of living animals have characteristic cell division rates which can be perturbed by environmental changes, cell cycle dependence of cellular damage is an essential component of models which are generated in an attempt to correlate the effects in animals with cellular data. Cell cycle variations also provide additional data which may help elucidate the mechanisms controlling cellular damage. Since we have observed two repair rates in plateau phase CHO cells and since these cultures include cells held in various parts of the cycle, it is natural to suspect that the changes in sensitivity may be caused by different parts of the cell cycle. Experiments were performed utilizing centrifugal elutriation methods in order to obtain populations enriched with cells of specific ages.

43616 (PNL–6500-Pt.4, pp. 50-51) **Implementation of additional cell types for transformation studies.** Nelson, J.M.; Metting, N.F.; Braby, L.A. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Our experience with 10T1/2 cells, the cell line generally used for such experiments, indicates that these cells are not suitable for our studies. We have recently made arrangements to obtain two additional cell lines recently developed by G.W. Barendsen. One of these, the NBCH-3 cell line, was derived from a clone which developed spontaneously in a primary cell culture of tissues from a newborn Chinese hamster. The assay procedure to be used with this cell line is the same as that for the C3H 10T1/2 cells; however, clonal development and morphology are considerably clearer. In addition, another cell line, denoted WAGR-2, was also derived in Barendsen's laboratory from the tissues of a newborn Wistar rat. The origin of the cells is again uncertain, but the procedures used for determining transformation frequencies with this cell line are essentially the same as for C3H 10T1/2 cells. Use of one or both of these new cell systems for our transformation experiments should not only increase the capabilities of the studies, but their use should make the assay both more accurate and simpler to perform.

43617 (PNL–6500-Pt.4, pp. 51-52) **Effect of oxygen on the production of sublethal damage.** Braby, L.A.; Nelson, J.M.; Metting, N.F. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

The response of cells to the concentration of oxygen in their cytoplasm during irradiation has received a great deal of attention. We found, in cells which were hypoxic but which did not show the full expected oxygen enhancement ratio, that the sparing effect of a split-dose interval of a few hours was eliminated, but that effects of longer intervals or a plating delay were not changed. Because this effect depends on the oxygen concentration at the time of irradiation, but is uninfluenced by the concentration during the interval between doses, we believe that it indicates that two different radiation chemistry reactions, one requiring oxygen and the other not, are responsible for the damage that is repaired at the different rates.

43618 (PNL–6500-Pt.4, pp. 55-58) **Deoxycytidine modulates the sensitivity of a repair-deficient CHO cell line to UV light.** Miller, J.H.; Newman, C.H.; Jeggo, P. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

The presence of 2 mM deoxycytidine (CdR) in the growth medium dramatically increases pools of deoxycytidine triphosphate (dCTP) and deoxythymidine triphosphate (dTTP) in a Chinese hamster ovary cell line (CHO-K1) and a radiation-sensitive mutant (xrs-5) derived from it. Since dCMP deaminase activity is high in both cell lines, it is not surprising that CdR increases the size of both dCTP and dTTP pools. In neither medium do we observe a difference between parent and mutant with respect to the size of dCTP or dTTP pools. We have investigated the correlation between

these dNTP pool changes and the effects of 2mM CdR on the response of the cell lines to ultraviolet (UV) light and x-ray exposure. UV mutagenesis of xrs-5 is significantly reduced by the presence of CdR while mutation induction in the parent cell line is unaffected. Similarly, the reduction in cell killing by UV light when the growth medium contains 2 mM CdR is greater for xrs-5 than for the parent cell line. The presence of 2 mM CdR has no effect on the sensitivity of either cell line to killing by x-rays.

43619 (RERF-TR-0-86) **Radiation Effects Research Foundation bibliography of published papers, 1986.** Radiation Effects Research Foundation, Hiroshima (Japan). 1987. 11p. (In Japanese, English). Order Number DE89906610/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The bibliography lists the titles of a total of 75 papers published by members of the Radiation Effects Research Foundation in 1986 (three of them published in 1985). The papers cover; 'The central nervous system and in utero exposure to ionizing radiation', 'Future directions for biostatistics and cancer epidemiology in Japan', 'Passive smoking and lung cancer among Japanese women', 'Late effects of atomic bomb radiation on human immune response', 'Delayed effects of atomic bomb radiation to human cellular immune competence', 'Characterization of three electrophoretic variants of human erythrocyte triosephosphate isomerase found in Japanese', 'A follow-up study of clonal T-lymphocytes with chromosome aberrations in Hiroshima A-bomb survivors', 'Comments on recent cytogenetic findings at RERF', 'Cytogenetic 'rogue' cells; What is their frequency, origin, and evolutionary sinificance?', 'A parallel analysis of cancer mortality among atomic bomb survivors and patients with ankylosing spondylitis given X-ray therapy', 'Cancer of the thyroid and salivary glands', 'Analysis of peripheral blood lymphocytes of atomic bomb survivors using monoclonal antibodies', 'Celluar immune competence of patients with lung cancer and other lung diseases. I. Analysis of peripheral blood lymphocyte subsets using monoclonal antibodies', etc. (N.K.) 75 refs.

43620 (RERF-TR-0-87) **Radiation Effects Research Foundation bibliography of published papers, 1987.** Radiation Effects Research Foundation, Hiroshima (Japan). Aug 1988. 15p. (In Japanese, English). Order Number DE89906572/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The report lists the titles and authors of the reports of studies made under the Radiation Effects Research Foundation. The list include 87 studies, which cover 'immunological diagnosis of lung cancer', 'electrophoretic variants of haptoglobin found in the children of atomic bomb survivors', 'rogue cells in the general human population', 'host variation of X-ray sensitivity among atomic bomb survivors with or without breast cancer', 'disorders in the endocrine gland and gonad of A-bomb survivors', 'incidence of vertebral compression fractures among atomic bomb survivors', 'measurement of the frequency of in vivo somatic mutation in atomic bomb survivors by T-cell cloning', 'mechanism of carcinogenesis in A-bomb survivors', 'effects of aging on blood pressure', 'expediting factors of blood sedimentation of heavily exposed survivors', 'record linkage between local cancer registry and tumor and tissue registries', 'reclassification of diagnosis and types of leukemia in atomic bomb survivors in Hiroshima', 'cytogenetic study in utero exposed individuals', 'estimation of indoor and outdoor A-bomb gamma-ray doses by thermoluminescence measurement', and many other studies. (N.K.) 87 refs.

43621 (RERF-TR-3-88) **Effect on intelligence test score of prenatal exposure to ionizing radiation in Hiroshima and Nagasaki. A comparison of the T65DR and DS86 dosimetry systems.** Schull, W.J.; Otake, Masanori; Yoshimaru, Hiroshi. Radiation Effects Research Foundation, Hiroshima (Japan). Oct 1988. 46p. (In Japanese, English). Order Number DE89906462/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Analyses of intelligence test scores (Koga) at 10-11 years of age of individuals exposed prenatally to the atomic bombing of Hiroshima and Nagasaki using estimates of the uterine absorbed dose based on the recently introduced system of dosimetry, the Dosimetry System 1986 (DS86), reveal the following: (1) there is no evidence of a radiation-related effect on intelligence among those individuals exposed within 0-7 weeks after fertilization or in the 26th or subsequent weeks; (2) for individuals exposed at 8-15 weeks after fertilization, and to a lesser extent those exposed at 16-25 weeks, the mean tests scores but not the variances are significantly heterogeneous among exposure categories; (3) the cumulative distribution of test scores suggests a progressive shift downwards in individual scores with increasing exposure; and (4) within the group most sensitive to the occurrence of clinically recognizable severe mental retardation, individuals exposed 8 through 15 weeks after fertilization, the regression of intelligence score on estimated DS86 uterine absorbed dose is more linear than with T65DR fetal dose, the diminution in intelligence score under the linear model is 21-29 points at 1Gy. The effect is somewhat greater when the controls receiving less than 0.01 Gy are excluded, 24-33 points at 1 Gy. These findings are discussed in the light of the earlier analysis of the frequency of occurrence of mental retardation among the prenatally exposed survivors of the A-bombing of Hiroshima and Nagasaki. It is suggested that both are the consequences of the same underlying biological process or processes. (author).

43622 (RERF-TR-5-88) **Life span study report, 11, part 2. Cancer mortality in the years 1950-85 based on the recently revised doses (DS86).** Shimizu, Yukiko; Kato, Hiroo; Schull, W.J. Radiation Effects Research Foundation, Hiroshima (Japan). Dec 1988. 106p. (In Japanese, English). Order Number DE89906463/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

ABCC and its successor, RERF, have followed since 1959 and retrospectively to 1950 the mortality in a fixed cohort of survivors of the atomic bombings of Hiroshima and Nagasaki, the so-called Life Span Study sample. The present study, the 11th in a series that began in 1961, extends the surveillance period three more years and covers the period 1950-85. It is based on the recently revised dose system, called DS86, that has replaced previous estimates of individual exposures. The impact of the change from the old system of dosimetry, the T65DR, to the new on the dose-response relationships for cancer mortality was described in the first of this series of reports. Here, the focus is on cancer mortality among the 76,000 A-bomb survivors within the LSS sample for whom DS86 doses have been estimated, with the emphasis on biological issues associated with radiation carcinogenesis. (author).

43623 (RERF-TR-6-88) **New serum indicator of activity of interstitial pneumonitis. Sialylated carbohydrate antigen KL-6.** Kohno, Nobuoki; Kyoizumi, Seishi; Awaya, Yukikazu; Fukuhara, Hirofumi; Yamakido, Michio; Akiyama, Mitoshi. Radiation Effects Research Foundation, Hiroshima (Japan). Sep 1988. 12p. (In Japanese, English). Order Number DE89906459/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Serum levels of a high molecular weight circulating antigen KL-6, which is detected by sandwich assay using a monoclonal antibody KL-6 against a sialylated carbohydrate antigen, were examined for usefulness in monitoring the activity of interstitial pneumonitis. Of the 59 interstitial pneumonitis patients, 34 (58%) exhibited abnormally high levels of KL-6 antigen in their sera and no significant correlation between serum KL-6 values and lactic dehydrogenase activities was noted. Moreover, KL-6 antigen levels showed a positive correlation with the degree of clinical activity of the disease as measured by ^{67}Ga-citrate scintigram and clinical outcome over time. These data suggest that serum KL-6 antigen may be a new useful indicator for estimating the degree of activity of interstitial pneumonitis, although it cannot be used for differential diagnosis of this disease from other malignant and nonmalignant diseases showing abnormally high levels of KL-6 antigen. (author).

43624 (UCRL-53917) **Estimates of the radiological dose from ingestion of ^{137}Cs and ^{90}Sr to infants, children, and adults in the Marshall Islands.** Robison, W.L.; Phillips, W.A. Lawrence Livermore National Lab., CA (USA). 17 Feb 1989. 29p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89014001/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this report, we examine whether the radiological dose equivalent due to the intake of ^{137}Cs and ^{90}Sr at a contaminated atoll in the Marshall Islands would be greater when intake begins as an adult than when intake begins as an infant or child. We found that

generally ^{137}Cs contributes 97 to 98% of the dose and ^{90}Sr contributes only 2 to 3 %. We also found that the integral 30-, 50-, and 70-y effective dose equivalent estimated for intake beginning as adults is greater than that for intake beginning at any other age. There are two factors that cause the adult estimated dose to be greater than the dose to infants and children. The major factor is the consistently higher intake of local foods, and consequently higher intake of ^{137}Cs, for adults. The second is a combination of changing body weights, fractional deposits, and biological half-life for ^{137}Cs with age, and the reduced concentration of ^{137}Cs in food with time. Consequently, the estimated effective integral dose equivalents for adults due to ingestion of ^{137}Cs and ^{90}Sr can be used as a conservative estimate or intake beginning in infancy and childhood. 95 refs., 4 figs., 10 tabs.

43625 (UCRL–101498) **Mouse model for somatic mutation at the HPRT [hypoxanthine phosphoribosyl-transferase] gene: Molecular and cellular analyses.** Burkhart-Schultz, K.; Strout, C.L.; Jones, I.M. Lawrence Livermore National Lab., CA (USA). 11 Jul 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-8907113–6: 5. international conference on environmental mutagens, 10-15 Jul 1989). Order Number DE89015334/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Our goal is to use the mouse to model the organismal, cellular and molecular factors that affect somatic mutagenesis in vivo. A fundamental tenet of genetic toxicology is that the principles of mutagenesis identified in one system can be used to predict the principles of mutagenesis in another system. The validity of this tenet depends upon the comparability of the systems involved. To begin to achieve an understanding of somatic mutagenesis in vivo, we have been studying mutations that occur in the hypoxanthine phosphoribosyl-transferase (HPRT) gene of lymphocytes of mice. Our in vivo model for somatic mutation allows us to analyse factors that affect somatic mutation. Having chosen the mouse, we are working with cells in which the karyotype is normal, and metabolic and DNA repair capacity are defined by the mouse strain chosen. At the organismal level, we can vary sex, age, the exposure history, and the tissue source of cells analysed. (All studies reported here have, however, used male mice.) At the cellular level, T lymphocytes and their precursors are the targets and reporters of mutation. 26 refs., 1 fig., 1 tab.

43626 (AD-A–205517/6/XAB) **Modeling the tissue solubilities and metabolic rate constant (V max) of halogenated methanes, ethanes, and ethylenes.** Gargas, M.L.; Seybold, P.G.; Andersen, M.E. Air Force Aerospace Medical Research Lab., Wright-Patterson AFB, OH (USA). 1988. 23p. (AAMRL-TR–88-065). Available from NTIS, PC A03/MF A01.

Pub. in Toxicology Letters, Vol. 43, 235-256(1988).

Experimental solvent:air and tissue:air partition coefficients for 25 halogenated methanes, ethanes, and ethylenes in saline solution; olive oil; and rat blood, muscle, liver, and fat tissues were examined using theoretical molecular modeling techniques. The metabolic rate constant, V_{max}, was also investigated by these techniques for 19 chlorinated compounds in this group. Two graph theoretical approaches (the distance method of Wiener and the connectivity index method of Randic, Kier, and Hall) and an approach utilizing ad hoc molecular descriptors were employed. Satisfactory regression models for solubility were obtained with both the Randic-Kier-Hall approach and the ad hoc descriptors approach. Fluorine substituents decrease tissue solubilities, whereas both chlorine and bromine substituents increase tissue solubilities, with the relative influence being chlorine<bromine. Tissue solubilities can also be represented conveniently in terms of contributions from oil and saline solubilities, a procedure reinforced by factor analysis of the data. Equations derived by these methods adequately estimated the solubilities for eight additional compounds. No approach could successfully model V_{max} for all 19 compounds, but a subset of 16 compounds was modeled using the connectivity indices. The equation is limited in its use but indicated future modeling directions for V_{max}.

43627 (AD-A–206082/0/XAB) **Dealing with uncertainty in chemical risk analysis. Master's thesis.** Clement, D.S. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Dec 1988. 176p. (AFIT/GOR/MA–88D-2). Available from NTIS, PC A09/MF A01.

For a given chemical there are usually several methods for estimating the risk. Each method is based on different assumptions. The arguments are plentiful for each method, but which method best estimates the risk. Choosing one method over another could lead to faulty risk estimates, thus the traditional methods have been very conservative to avoid underestimating the risk. With advances made in pharmacokinetics the EPA has come under pressure to re-evaluate its procedure for assigning risk. Which method or methods should be used and how much emphasis should be placed on each one. This study decomposes the various methods into their corresponding assumptions. A tree diagram is generated to describe the combinations of assumptions that make up each unit risk method. A subjective weight is assigned to each assumption (branch of the tree) to characterize its validity in estimating the risk. From this a weighted average of risk is calculated. A procedure is recommended for combining expert opinion when several experts are utilized in assigning the subjective weights. Two examples involving Methylene Chloride and 2,3,7,8-tetrachlorodibenzo-p-dioxin illustrate the decomposition method of estimating chemical risk.

43628 (AD-A–206743/7/XAB) **Synthesis of the results of the field-verification program wetland disposal alternative. Final report.** Simmers, J.W.; Rhett, R.G.; Kay, S.H.; Folson, B.L. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Environmental Lab. Feb 1989. 53p. (WES/TR/D–89-2). Available from NTIS, PC A04/MF A01.

Contaminated dredged material from the Black Rock Harbor (BRH) maintenance dredging project of the US Army Engineer Division, New England, was used to field verify: (a) procedures for predicting contaminant mobility into plants and (b) procedures for predicting contaminant mobility into animals. The wetland disposal site was constructed within a protected area using conventional construction techniques and was hydraulically filled from barges. The estuarine plant-bioassay procedures was used in the laboratory to evaluate heavy-metal uptake by plants from composited BRH sediment. The chemical and laboratory portions of the bioassay were used to predict potential plant uptake of heavy metals. In general, the laboratory plant-bioassay adequately predicted heavy metal content of field-grown Spartina alterniflora during the first 2 years following establishment of the wetland. The wetland animal-bioassay procedures was applied to composited BRH sediment in the laboratory using an adaptation of the plant bioassay apparatus. This adaptation was unsuitable because of high sandworm mortality during the test. Another study conducted with fresh sediment indicated that the BRH sediment had to be diluted for the animals to survive the static conditions of the test. A preliminary dynamic, tidal simulation rather than static bioassay was conducted using undiluted BRH sediment. The wetland animals not only survived in the simulated tidal bioassay, but results indicated that there was a potential for accumulation of heavy metals and organic contaminants.

43629 (AD-A–206976/3/XAB) **Preliminary pollutant limit value approach: manual for users. Final report, January 1987-June 1988.** Small, M.J. Army Biomedical Research and Development Lab., Fort Detrick, MD (USA). 1 Jul 1988. 130p. (USABRDL-TR–8918). Available from NTIS, PC A07/MF A01.

The Preliminary Pollutant Limit Value (PPLV) Approach to developing guidance contamination levels in soil and water is an established procedure throughout the US Army. In 1984, Technical Rept 8210 was issued to provide users with a reference document as to pathway equations and efforts in the development of the Rocky Mountain Arsenal Endangerment Assessments. In the approach, unique routes for human exposure to pollutants from a common medium (soil or water) are defined. Equations are presented for 7 such routes for water and 13 such routes for soil. These routes include water consumption, fish consumption, vegetable consumption, consumption of beef or dairy, direct intake of

soil, either in ordinary activities or from a dusty work site, and inhalation of volatile contaminants from a land site. In the case of beef and dairy consumption, consideration is given to animal exposure to a contaminant which is in feed material, drinking water or soil consumed when the animals graze.

43630 (DGMK–174-4) **Effects of ethylene on man and animals.** Angerer, J.; Herrmann, H.; Jungen, H.; Taeuber, U.; Wenzel-Hartung, R.P. Deutsche Wissenschaftliche Gesellschaft fuer Erdoel, Erdgas und Kohle e.V., Hamburg (Germany, F.R.). Nov 1988. 103p. (In German). Available from Copy held by UB/TIB Hannover.

The available scientific and practical knowledge concerning the effects of ethylene on humans and animals is reviewed and evaluated. The report describes the properties, preparation and industrial applications of ethylene, its natural occurence, uptake and transformation, and the distribution, excretion and detection of ethylene and its metabolites in humans and animals. The report is based on an extensive study of relevant publications and contains a detailed bibliography. According to the DGMK, observations so far suggest only a low toxic potential of chronic exposure to ethylene. On the other hand, a small fraction of ethylene is converted in the human organism into the carcinogenic metabolite ethylene oxide, so that a potential carcinogenic effect, however slight, cannot be excluded even if it may never been proved. (orig./MG) With 1 fig., 9 tabs.

43631 (DOE/EV/04580–8) **Mechanisms and functional morphology associated with metal transport in Mercenaria mercenaria (Bavalvia: Mollusca): Final report, September 1, 1977–February 28, 1989.** Robinson, W.E.; Morse, M.P. New England Aquarium Corp., Boston, MA (USA). Harold E. Edgerton Research Lab. 28 Feb 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-77EV04580. Order Number DE89015789/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

From September 1977 through July 1981 the primary goal of our research was to determine the effect of oil-well drilling muds on the commercially important bivalve species of Georges Bank. Studies included toxicological effects of various drilling mud components, research on energy stores and reproduction, effects of turbidity on feeding and digestion in both adult and larval bivalves, and the effects of drilling mud components on bivalve gills. Our findings implicated a variety of metals present in drilling muds as the purveyors of both lethal and sublethal effects, and prompted our subsequent work on the mechanisms of metal accumulation, detoxification and transport in marine bivalve molluscs (August 1981 through February 1989). Using radioactive cadmium (primarily) and silver, we have examined metal-storage compartments and kidney detoxification mechanisms in Mercenaria mercenaria. Results have shown that the kidney is the primary site of metal sequestration, due to both a low molecular weight metal-binding protein and numerous calcium phosphate granules. Metal transport experiments have shown that blood plasma proteins may play a major role in transporting metals to the kidney for sequestration and elimination. 31 refs.

43632 (EC–ARB-169-86) **Nanticoke spring grain study, 1985.** Pearson, R.G.; Archibald, B.; Bentley, H. Environment Canada, Ottawa, ON (Canada). 1987. 57p. (MICROLOG–87-06370). Available from Environment Canada, Library Services, Terrasses de la Chaudiere, 10 Wellington St., Ottawa, ON, CAN K1A 0H3; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

In 1985, following numerous complaints from farmers in the vicinity of the Nanticoke industrial complex (which contains a large thermal power plant) that they could no longer grow spring cereal crops due to adverse air quality conditions, a field study was initiated. It consisted of establishing a total of 15 spring barley study sites throughout the area to the north and northeast of the complex, and in a control area located well remote from the area of concern but with similar soil and meteorological conditions. During the growing season, the sites were observed an sampled extensively for foliar chemistry, nutrient status, soil accumulation and fertility parameters. The physical condition of the various soils and barley crops also was recorded and all sites were harvested for yield determination. In all, over 3000 chemical and physical test parameters were generated for evaluation. In addition to the crop monitoring in 1985, historical barley yields from this area were obtained and compared with rainfall data and with SO_2 air quality monitoring results during the past 11 years. These seasonal air quality parameters were then compared with the dose-response relationships that were obtained from a literature review. Results showed no relationship between historical air quality (sulfur dioxide) patterns and crop productivity. The 1985 results also ruled out any significant elemental deposition or foliar contamination which would be detrimental to the growth of spring grains in this area. The findings did reveal, however, that the heavy clay soils in this area are prone to severe hard-pan formation and to adverse weather (rainfall) conditions. In this regard, spring planting date appears to be the single greatest factor affecting crop yield. 13 refs 5 figs 22 tabs

43633 (EPRI-EA–6072, pp. 7.1-7.27) **Statistical analysis of Salmonella test data and comparison to results of animal cancer tests.** McCann, J. (Lawrence Berkeley Lab., CA (USA)); Horn, L.; Kaldor, J.; Gold, L.S.; Siegel, R.; McGill, R.; Graedel, T.E. Electric Power Research Inst., Palo Alto, CA (USA); Clement Associates, Inc., Ruston, LA (USA). Nov 1988. (CONF-8603254–: EPRI workshop on innovative approaches in cancer risk assessment, Mar 1986). In *Innovative approaches in cancer risk assessment. Proceedings.* Order Number DE89004099/JAW. Available from Research Reports Center, Box 50490, Palo Alto, CA 94303.

The results are described of several collaborative studies aimed at examining the utility of short-term tests in the carcinogenic risk assessment process focusing on the Salmonella (Ames) test. Here, most recent work is presented, including new techniques for the display and analysis of Salmonella data and comparisons of Salmonella results with animal cancer test results. The research has had two basic purposes. First, the use of short-term tests is validated by comparing results to those obtained from animal tests that measure carcinogenesis directly. Relevant to this is the recent work done to extend the positivity comparisons performed with Bruce Ames some years ago and to compare measures of mutagenic and carcinogenic potency. Second, short-term tests are examined as a self-contained unit, without reference to how results might or might not compare to other systems considered more relevant to humans. Since short-term tests measure different aspects of DNA- damaging potential, it is useful to classify chemicals according to this potential and thereby further our understanding of their potential to interact with living systems in harmful ways. Work begun in this area will also briefly be discussed.

43634 (FEARO–802) **Canadian Environmental Protection Act. Priority substances list.** Federal Environmental Assessment Review Office, Ottawa, ON (Canada). 1989. 543-545p. (In English and French). (CE–02655). Available from Federal Environmental Assessment Review Office, Fontaine Bldg., 13th floor, Ottawa, ON, CAN K1A 0H3; $N/C; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

According to the Canadian Environmental Protection Act, proclaimed June 30, 1988, the Ministers shall compile and may amend from time to time a list known as the Priority Substances List, and the List shall specify substances in respect of which the Ministers are satisfied priority should be given in assessing whether they are toxic or ccapable of becoming toxic. this list is given here. Assessment reports for the substances in groups 1, 2, and 3 are planned for completion within 3, 4, and 5 years, respectively. 1 tab.

43635 (ORNL/M–878) **TNT metabolites in animal tissues: Quarterly technical progress report (No. 3), April 1, 1989–June 30, 1989.** Shugart, L.R. Oak Ridge National Lab., TN (USA). Jul 1989. 27p. Sponsored by U.S. Department of Defense. DOE Contract AC05-84OR21400. Order Number DE89015413/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The overall objectives of this project are: (1) to provide quantitative analytical procedures for the analysis of TNT and at least eight of its metabolites in animal tissues, and (2) to obtain representative samples of tissues from animals from designated Army sites and to determine the presence or absence of TNT and its metabolites in these samples. The study is divided into two Phases corresponding to the stated overall objectives of the project.

43636 (ORNL/M–889) **Disposal of chemical agents and munitions stored at Anniston Army Depot, Anniston, Alabama: Final Phase 1 environmental report.** Oak Ridge National Lab., TN (USA). Jul 1989. 157p. Sponsored by U.S. DOE Radioactive Waste Management. DOE Contract AC05-84OR21400. Order Number DE89016276/JAW. Available from NTIS, PC A08/MF A01 - OSTI.

The purpose of this Phase I report is to examine the proposed implementation of on-site disposal at Anniston Army Depot (ANAD) in light of more detailed and more recent data than those included in the Final Programmatic Environmental Impact Statement (FPEIS). Two principal issues are addressed: (1) whether or not the new data would result in identification of on-site disposal at ANAD as the environmentally preferred alternative (using the same selection method and data analysis tools as in the FPEIS), and (2) whether or not the new data indicate the presence of significant environmental resources that could be affected by on-site disposal at ANAD. In addition, status reports are presented on maturity of the disposal technology (and how it could affect on-site disposal at ANAD) and on the tracking of changes in technology to ensure that the overall risk identified in the FPEIS is not exceeded. 6 refs., 11 figs., 10 tabs.

43637 (PB–89-168272/XAB) **Value of LD 50 as given for the acute toxicity of products and compounds). Final report.** Gezondheidsraad, The Hague (Netherlands). 24 Jun 1988. 78p. (In Dutch). Available from NTIS, PC EE05/MF A01.

Presented is a South African study of alternatives to using laboratory animals for toxicity testing. Results suggest that a reduction of 35-100% in animal usage is possible when drugs and cosmetics are tested by other than the traditional methods.

43638 (PB–89-174726/XAB) **Emergency and continuous exposure guidance levels for selected airborne contaminants: Volume 8. Lithium chromate and trichloroethylene. Final report.** National Research Council, Washington, DC (USA). Committee on Toxicology. Mar 1989. 73p. Available from NTIS, PC A04/MF A01.

See also PB–86-145158.

This report recommends emergency exposure guidance levels (EEGLs) of 1 and 24 hours for lithium chromate and trichloroethylene. The EEGL for lithium chromate is 100 micrograms/cu m for 1 hour and 50 micrograms/cu m for 24 hours. The EEGL for trichloroethylene is 200 ppm for 1 hour and 10 ppm for 24 hours. A survey of the relevant literature and a rationale for the recommendations promulgated is included.

43639 (PB–89-178529/XAB) **Toxicology and carcinogenesis studies of crocidolite asbestos (CAS No. 12001-28-4) in F344/N rats (feed studies). Technical report.** National Toxicology Program, Research Triangle Park, NC (USA). Dec 1988. 177p. (NTP-TR–280). Available from NTIS, PC A09/MF A01.

Toxicology and carcinogenesis studies of crocidolite asbestos were conducted by administering the chemical to male and female F344/N rats at a concentration of 1% in feed for the lifetime of the animals. Under the conditions of these feed studies, crocidolite asbestos was not overtly toxic and did not cause a carcinogenic response when ingested at a concentration of 1% in the diet by male and female F344/N rats for their lifetime.

43640 (PB–89-178891/XAB) **Effects of ozone on cellular synthesis and viral replication in vitro. Final report, January 1985-November 1988.** Zee, Y.C. California Univ., Davis, CA (USA). Dept. of Veterinary Microbiology and Immunology. Nov 1988. 85p. Available from NTIS, PC A05/MF A01.

This project used a system developed for exposing isolated cells and tissues to ozone to address three major objectives: to determine the effect of ozone on the replication of several human and animal viruses; to investigate the effects of ozone on rates of macromolecular synthesis in several cell lines; and to measure the effects of ozone on the ability of tracheal tissue to produce interferon. The major result was that cells infected with viruses either during or after ozone exposure were capable of supporting normal viral replication. A separate result showed that cellular damage generally increased with increased ozone exposures and that longer exposure times appeared to cause cellular changes that were not apparent after shorter exposure times. Additionally, ozone exposures had no effect on the ability of isolated tracheas to produce interferon.

43641 (PB–89-181366/XAB) **Evaluation of the potential carcinogenicity of lead and lead compounds: in support of reportable quantity adjustments pursuant to CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) section 102. Draft report.** Environmental Protection Agency, Washington, DC (USA). Office of Health and Environmental Assessment. Mar 1989. 142p. (EPA–600/8-89/045A). Available from NTIS, PC A07/MF A01.

Information on the potential carcinogenicity of lead and lead compounds is summarized and evaluated. The human studies provide suggestive evidence of carcinogenicity, but, because of confounding exposures to other carcinogens and the lack of measurements of lead exposure, are inadequate to prove or disprove carcinogenicity. Numerous long-term animal studies, using several different forms of lead and routes of exposure, provide sufficient evidence. This combination of evidence, together with information from short-term tests, other toxic effects, and pharmacokinetic properties, yields a classification of lead and lead compounds as probably human carcinogen, Group B2. No specific cancer potency has been estimated for lead. Many factors influence lead-induced cancer, creating difficulties in selecting an appropriate measure of dose. Cross-species pharmacokinetic models are needed before the animal studies can be used to estimate a human cancer potency. Because it has been relatively high concentrations of lead that have increased the incidence of cancer in animals, it seems appropriate to characterize the cancer potency of lead as low, placing lead in potency Group 3.

43642 (PB–89-181986/XAB) **Health-hazard evaluation determination report No. 77-10-412; American Smelting and Refining Company, Denver, Colorado.** National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Aug 1977. 25p. (HHE–77-010-412). Available from NTIS, PC A03/MF A01.

Environmental and medical surveys were conducted on December 6-9, 1976 and March 28-30, 1977 to evaluate potential hazards associated with exposure to cadmium, lead, and zinc during the operation of a secondary smelter at the Globe facility of the American Smelting and Refining Company in Denver, Colorado. Blood lead concentrations exceeded the harmful concentration of 60 micrograms per 100 ml. Elevated blood-lead concentrations corresponded with an elevated free erythrocytic protoporphyrin concentration. Blood-cadmium concentrations exceeded the nonexposed concentration of 1 microgram per 100 ml. Urine-cadmium concentrations exceeded the 15 micrograms per gram creatinine normal concentration. Environmental-cadmium concentrations exceeded the OSHA standard of 0.1 mg/Cum. All zinc concentrations were below recommended standards. Environmental-lead concentrations exceeded the OSHA standard of 0.2 mg/CuM. The authors conclude that a health hazard to workers exposed to lead and cadmium did exist at the time of the evaluation.

43643 (PB–89-183065/XAB) **Effects of temperature and particle size on acid aerosol-induced bronchoconstriction. Report for April 1986-November 1988 (Final).** Sheppard, D.; Balmes, J.; Christian, D. California Univ., San Francisco, CA (USA). Cardiovascular Research Inst. Jan 1989. 59p. Available from NTIS, PC A04/MF A01.

The investigators exposed asthmatic subjects to aerosols of sulfuric acid or saline with varying particle size and osmolarity. Aerosols of unbuffered sulfuric acid at pH 2 did not cause bronchoconstriction in the subjects when inhaled during rest at a sulfate concentration of nearly 3 mg/cm m. Neither osmolarity nor particle size appeared to influence the lack of bronchoconstrictor effect. The investigators also studied whether there was a positive interaction between acidity and low temperature with regard to the potentiation of hypoosmolar aerosol-induced bronchoconstriction. They exposed asthmatic subjects to hypoosmolar aerosols of either sulfuric acid at pH 2 or saline at pH 5.5 at either 7 or 22 deg C. No evidence of a positive interaction between acidity and low temperature was found.

43644 (PB–89-184519/XAB) **Study to determine the possible hazard of methylmercury in seafood to the fetus in utero. Final report, 1980-1985.** Marsh, D.O.; Turner, M.D.; Smith, J.C. National Fisheries Inst., Inc., Washington, DC (USA). Dec 1985. 96p. Available from NTIS, PC A05/MF A01.

This study was conducted to determine the possible hazards of methylmercury (MeHg) in seafood to the fetus in utero. Hair and

blood samples of pregnant women in New Bedford, MA, Manta, Ecuador, and Mancora, Peru (all areas of high seafood consumption) were examined. These samples were collected and studied at various stages of gestation and during pre- and post-natal periods. In some cases, blood and hair samples of some of the infants born to these women were also examined. The women of Manta and Mancora showed higher levels of MeHg than the women in New Bedford. However, no health hazards could be linked to any of the infants from the ingestion of MeHg in marine fish. Although no human data exist, experimental evidence suggests marine fish may contain elements that reduce the toxicity of MeHg and it's possible that selenium contributes to the protective effect of fish vs. grain diets. Tables of MeHg levels in the study groups are attached to the report.

43645 (PB–89-185706/XAB) **Toxicological Profile for Arsenic. Final report.** Life Systems, Inc., Cleveland, OH (USA). Mar 1989. 131p. Available from NTIS, PC A07/MF A01.

The ATSDR Toxicological Profile for Arsenic is intended to characterize succinctly the toxicological and health-effects information for the substance. It identifies and reviews the key literature that describes the substance's toxicological properties. Other literature is presented but described in less detail. The profile is not intended to be an exhaustive document; however, more comprehensive sources of specialty information are referenced. The profile begins with a public health statement, which describes in nontechnical language the substance's relevant toxicological properties. Following the statement is material that presents levels of significant human exposure and, where known, significant health effects. The focus of the document is on health and toxicological information.

43646 (PB–89-187173/XAB) **Pentachlorophenol hazards to fish, wildlife, and invertebrates: a synoptic review. Biological report.** Eisler, R. Patuxent Wildlife Research Center, Laurel, MD (USA). Apr 1989. 83p. (BIOLOGICAL–85(1.17)). Available from NTIS, PC A05/MF A01.

Pentachlorophenol (PCP) is now widely used as a wood preservative; this use has contributed to the presence and detection of PCP residues in air, rain, ground water, surface water, fish and aquatic invertebrates, and human urine, blood, and milk. The report reviews the technical literature on ecological and toxicological aspects of PCP in the environment, with emphasis on fishery and wildlife resources. Subtopics include sources and uses, chemical properties, fate, background concentrations, lethal and sublethal effects, and current recommendations for resource protection.

43647 (PB–89-190102/XAB) **Investigations in fish control: 98. History of acute toxicity tests with fish, 1863-1987.** Hunn, J.B. National Fishery Research Lab., La Crosse, WI (USA). 1989. 16p. (LCCCN–89-600014). Available from NTIS, PC A03/MF A01.

See also PB–89-154108. Library of Congress catalog card no. 89-600014.

Acute-toxicity tests with fish were first reported in 1863. Test methodology developed slowly before World War II but after the war, considerable effort was made to standardize test methods. A standardized method was published in 1960, refined in 1975, and updated in 1980. The primary use of the static acute-toxicity test is to determine the median concentrations of chemicals that are lethal to aquatic organisms. Static acute-toxicity tests will continue to play an essential role in aquatic toxicology in the foreseeable future.

43648 (PB–89-190383/XAB) **Health assessment of toluene in California drinking water.** Reed, N.; Reed, W.; Beltran, L.; Li, R.; Encomienda, I. California Univ., Davis, CA (USA). Dept. of Environmental Toxicology. 8 Mar 1989. 145p. (UCD/ET–89/1). Available from NTIS, PC A07/MF A01.

This report reviews existing literature pertinent to the health risk posed by the use of toluene-contaminated drinking water. Also included in the study is an estimate of the toluene exposure of California residents based on the most recent data on toluene concentrations in California drinking water supplies. The concentration of toluene in drinking water that may cause adverse health effects is delineated.

43649 (PB–89-862049/XAB) **Bioaccumulation of heavy metals by fish. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989.** National Technical Information Service, Springfield, VA (USA). May 1989. 131p. Available from NTISPC N01/MF N01.

Supersedes PB–87-866810.

This bibliography contains citations concerning distribution and bioaccumulation of heavy metals in marine and freshwater fish. Surveys, toxicological effects, mechanisms of accumulation, as well as temperature and concentration effects are discussed. (This updated bibliography contains 220 citations, 26 of which are new entries to the previous edition.)

43650 (PB–89-863617/XAB) **Toxicity of fibers and fiber composites. January 1970-September 1988 (Citations from the NTIS data base). Report for January 1970-September 1988.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 276p. Available from NTISPC N01/MF N01.

See also PB–89-863625.

This bibliography contains citations concerning the toxicity of occupational exposures to fibers and fiber composites. Topics include respiratory illnesses due to chronic exposure to asbestos and glass fibers, and methods and equipment for control of airborne fibers. (This updated bibliography contains 433 citations, none of which are new entries to the previous edition.)

43651 (PB–89-863625/XAB) **Toxicity of fibers and fiber composites. October 1988-May 1989 (Citations from the NTIS data base). Report for October 1988-May 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 41p. Available from NTISPC N01/MF N01.

Supersedes PB–88-869722. See also PB–89-863617.

This bibliography contains citations concerning the toxicity of occupational exposures to fibers and fiber composites. Topics include respiratory illnesses due to chronic exposure to asbestos and glass fibers, and methods and equipment for control of airborne fibers. (This updated bibliography contains 48 citations, all of which are new entries to the previous edition.)

43652 (PB–89-864102/XAB) **Toxicity bioassays: water-pollution effects on aquatic animals and plants. June 1986-June 1989 (Citations from the Selected Water Resources Abstracts data base). Report for June 1986-June 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 66p. Available from NTISPC N01/MF N01.

Supersedes PB–88-863907.

This bibliography contains citations concerning toxicity bioassay studies of water-pollution effects on reproduction, growth, and mortality of aquatic animals and plants. Industrial and agricultural water pollutants such as metals, chemicals, pesticides, and herbicides are evaluated and tested. Standard fishes and algal assays are used to determine effects of potential toxicants. (This updated bibliography contains 94 citations, 32 of which are new entries to the previous edition.)

43653 (PB–89-864755/XAB) **Toxicity of halogenated organic compounds. March 1983-June 1988 (Citations from the NTIS data base). Report for March 1983-June 1988.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 253p. Available from NTISPC N01/MF N01.

See also PB–89-864763.

This bibliography contains citations concerning health and environmental effects of halogenated organic compounds. Topics include laboratory and field investigations regarding bioaccumulation and concentration, metabolic aspects, and specific site studies in industrial and commercial operations. Pesticides, solvents, and a variety of industrial compounds are discussed. (This updated bibliography contains 398 citations, none of which are new entries to the previous edition.)

43654 (PB–89-864763/XAB) **Toxicity of halogenated organic compounds. July 1988-June 1989 (Citations from the NTIS data base). Report for July 1988-June 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 68p. Available from NTISPC N01/MF N01.

Supersedes PB–88-866330. See also PB–89-864755.

This bibliography contains citations concerning health and environmental effects of halogenated organic compounds. Topics include laboratory and field investigations regarding bioaccumulation and concentration, metabolic aspects, and specific site studies in industrial and commercial operations. Pesticides, solvents, and a variety of industrial compounds are discussed. (This updated bibliography contains 93 citations, all of which are new entries to the previous edition.)

43655 (PNL–6500-Pt.4, pp. 1-4) **Determination of adducts of polycyclic aromatic hydrocarbons to DNA.** Bean, R.M.; Chess, E.K.; Thomas, B.L.; Dankovic, D.A.; Pavlovich, J.; Mann, D.B.; Franz, J.A.; Springer, D.L. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

The objective of this work is to develop methods for the analysis of DNA adducts that will permit identification and quantification of adducted polycyclic aromatic hydrocarbon metabolites at environmental levels. The primary analytical approach is to isolate the bound metabolites by cleaving the covalent bond that attach them to the DNA, and to treat them with reagents that will increase their sensitivity to mass spectrometric detection.

43656 (UCRL–21110) **Conventional weapons demilitarization: A health and environmental effects data base assessment: Propellants and their co-contaminants.** Mallon, B.; Layton, D.; Fish, R.; Hsieh, P.; Hall, L.; Perry, L.; Snyder, G. Lawrence Livermore National Lab., CA (USA). Aug 1988. 193p. Sponsored by U.S. Department of Defense. DOE Contract W-7405-ENG-48. Order Number DE89016664/JAW. Available from NTIS, PC A09/MF A01 - OSTI; GPO Dep.

The demilitarization of propellants by open burning results in the deposition of residues on soils. Residues can consist of the main ingredients in propellant formulations, namely, nitrocellulose, nitroglycerin, and nitroguanidine. Co-contaminants, consisting of plasticizers and stabilizers present in propellant formulations as well as environmental degradation products of the propellants, represent additional soil contaminants. These substances include nitrosoguanidine, dibutylphthlate, diethylphthlate, dipenylamine, and ethyl centralite. To support studies of the health and environmental risks of such by-products, this report presents assessments of data available on parameters that affect the risks posed by propellants and their principal co-contaminants. Specifically, data-base assessments cover factors that influence the transport and fate of the contaminants in environmental media (e.g., soils, water, etc.) and subsequently, human exposures via different pathways (e.g., inhalation, ingestion, and skin absorption). Importantly, information on dose-response relationships for various toxic effects in humans and laboratory animals is evaluated so that acceptable daily intakes for noncarcinogenic substances and virtually safe dose rates species are also addressed. 284 refs.

43657 (AD-A–206152/1/XAB) **Intensity threshold for 60-Hz magnetically induced behavioral changes in rats.** Liboff, A.R.; Thomas, J.R.; Schrot, J. Naval Medical Research Inst., Bethesda, MD (USA). 1989. 4p. (NMRI–89-14). Available from NTIS, PC A02/MF A01.

Pub. in Bioelectromagnetics, Vol. 10, 111-113(1989).

Experiments were conducted to further investigate the effect of 60-Hz cyclotron-resonance exposures on rats performing on a multiple FR-DRL schedule. The previously reported temporary loss of DRL baseline response, when measured as a function of A.C. magnetic intensity, was found to have a threshold. Utilizing the component of A.C. magnetic intensity parallel to the D.C. field, we report this threshold as (0.27 + or - 0.10) X 10-4 Trms.

43658 (AD-A–206230/5/XAB) **Functional assessment of laser irradiation. Final report (Annual), 1 July 1974-30 June 1986.** Robbins, D.O. Ohio Wesleyan Univ., Delaware, OH (USA). Dept. of Psychology. Mar 1988. 30p. Available from NTIS, PC A03/MF A01.

Exposure of the fovea to intense coherent light can produce either transient or permanent changes in the eye's ability to resolve fine spatial detail. Permanent functional changes can occur in the absence of gross morphological damage and at power densities below the ED50 level. Furthermore, the eye may become increasingly susceptible to damage after repeated low-level exposures which initially produce only transient effects. Independent of any long-term hazards, laser exposures can also disrupt visual/motor behavior for periods of up to 96 hrs.

43659 (AD-A–206290/9/XAB) **Noise and sonic-boom impact technology. PCBOOM computer program for sonic-boom research. Volume 1. Technical report. Final report, May 1987-October 1988.** Bishop, D.E. BBN Labs., Inc., Canoga Park, CA (USA). Oct 1988. 56p. (BBN–6741-VOL-1). Available from NTIS, PC A04/MF A01.

See also Volume 2, AD-A206 291.

The PCBOOM computer program, described in this technical report, calculates the location and magnitude of sonic-boom overpressures on the ground due to supersonic flight under standard atmosphere and no wind-propagation conditions. The program is intended for environmental planners and engineers who may need to estimate the noise impact from individual flights of supersonic military aircraft. The program runs on a Zenith Z-248 personal computer and also should run on most similarly configured IBM-compatible computers. The program contains information for all current military aircraft and allows updating for additional aircraft. The user can select either 'Quick look' computations which assume steady-state flight or detailed ray-tracing calculations which can handle nonsteady flight and sonic-boom focus conditions. Several types of simple maneuvers can be selected for computations; the program will also handle up to ten connected straight-line segments. Flight segments from the MOAOPS library of supersonic combat training flights may also be selected. User-specified output for printer, plotter or screen includes tables of overpressures and graphic display of the sonic-boom overpressure 'footprints' on the ground. The footprint plots show the location of all ray positions that exceed overpressures of a given level. Flight track, Mach number, and altitude profile plots are also provided. This report summarizes the technical basis for PCBOOM. Two other reports provide a program users/computer operations manual and a program maintenance manual.

43660 (AD-A–206291/7/XAB) **Noise and sonic-boom impact technology. PCBOOM computer program for sonic-boom research. Volume 2. Program users/computer operations manual. Final report, May 1987-October 1988.** Salvetti, A.; Seidman, H. BBN Labs., Inc., Canoga Park, CA (USA). Oct 1988. 58p. (BBN–6742-VOL-2). Available from NTIS, PC A04/MF A01.

See also Volume 1, AD-A206 290.

This report contains the information for both the user and for computer operations. The report provides the user with the information necessary to effectively use PCBOOM. In addition, it provides the computer operations personnel with a description of the computer system and its associated environment. Two other reports provide a technical discussion of the algorithms used and a program maintenance manual.

43661 (AD-A–206514/2/XAB) **Additivity of retinal damage for multiple-pulse laser exposures. Final report, October 1985-January 1988.** Zuclich, J.A.; Blankenstein, M.F. Krug International, San Antonio, TX (USA). Technology Services Div. Dec 1988. 25p. Available from NTIS, PC A03/MF A01.

This study examined the cumulative effects of multiple-pulse laser exposures in contributing to retinal damage via a thermal mechanism. Three sets of experiments have been conducted to determine the variation of multiple-pulse thresholds: With the interval between pulses; with the number of pulses in the pulse train when the interpulse interval is held constant; and with the retinal image size when both number of pulses and interpulse interval are invariant. In addition, thermal model calculations were carried out to compare model predictions with the experimental data. Conclusions from the experimental data are: (1) The threshold for a multiple-pulse train is related to that for an individual pulse in the train by a function of the number of pulses, but is independent of pulse-repetition frequency and pulse train length. This observation is in general accordance

both with the thermal model predictions and with previously empirical models. (2) The additivity of multiple pulses is quantitatively similar for collimated and expanded laser beams incident at the eye. (3) The repair or recovery of laser-induced reversible retinal damage (i.e., sub-threshold with respect to the ophthalmoscopic lesion endpoint) is slow, having a time constant of the order of days. Thus, the cumulative nature of multiple-pulse or repeated exposures within a 24-hr period is relatively unaffected by the ongoing repair process; and only when repeated daily exposures are of concern does the repair process become a factor.

43662 (AD-A–206923/5/XAB) **Theoretical models for interaction of electromagnetic fields with biological tissues. Final report, 1 July 1986-1 July 1988.** Nussbaum, J.H.; Grodzinsky, A.J. Massachusetts Inst. of Tech., Cambridge, MA (USA). Lab. for Electromagnetic and Electronic Systems. Jan 1989. 28p. Available from NTIS, PC A03/MF A01.

This work demonstrates that electric fields can modulate intramembrane ionic concentrations, transmembrane ionic fluxes, mechanical conformation of membranes, and transmembrane potential. Even symmetrically applied fields of opposite polarities can result in asymmetric mechanical, concentration and flux responses, hence rectification of electrochemical and electrochemical phenomena can produce long-term effects even though the induced change is small. The general electro-mechano-chemical model presented predicts rectification phenomena and includes mechanical and electromechanical conformational change dynamics.

43663 (PB–89-188031/XAB) **Health-hazard evaluation report No. HETA-88-136-1945, Miller Thermal Technologies, Inc., Appleton, Wisconsin.** Moss, C.E.; Tubbs, R.L. National Inst. for Occupational Safety and Health, Cincinnati, OH (USA). Jan 1989. 50p. (HETA–88-136-1945). Available from NTIS, PC A03/MF A01.

In response to a management request, a study was made of possible hazardous working conditions at Miller Thermal Technologies, Inc., Appleton, Wisconsin. Thermal arc spraying (TAS) was used at this facility to apply metal and plastic coatings to substrates. The maximum measured levels of actinic, visible, and infrared radiation measured at the thermal spray system were 22 microwatts/square centimeter (microW/sq cm), 16.7 candelas/sq cm, and 170 microW/sq cm, respectively. Octave band and weighted noise measurements indicated values in excess of 101 decibels-A during operation which indicated that exposure could last no more than 1 hour to be in compliance with NIOSH guidelines. Selected metal-fume samples indicated a potential for exposure to hazardous concentrations of nickel, chromium, and iron. The authors conclude that workers were exposed to potentially hazardous optical radiation, excessive noise levels, and concentrations of toxic metal fumes. The authors recommend the use of appropriate eye, respiratory, and hearing protective equipment. Recommendations are included concerning ventilation system improvements and emergency equipment provisions.

43664 (PB–89-863849/XAB) **Biological effects of electrical or magnetic field application. April 1987-May 1989 (Citations from the Life Sciences Collection data base). Report for April 1987-May 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 41p. Available from NTISPC N01/MF N01.

Supersedes PB–88-865506.

This bibliography contains citations concerning the application of electrical or magnetic fields to organisms. Changes in cell structure, cell shape, metabolism, mitosis, cell orientation, neuron response, germination response, and growth rates are discussed. The effect of electrical or magnetic fields from transmission lines is examined. Biological applications of electric fields cited include genetic transfer, plant cell fusion, and seed disinfection. (This updated bibliography contains 72 citations, 30 of which are new entries to the previous edition.)

43665 (PB–89-864938/XAB) **Noise control for motor vehicles. January 1970-June 1989 (Citations from the COMPENDEX data base). Report for January 1970-June 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 110p. Available from NTISPC N01/MF N01.

Supersedes PB–83-805440.

This bibliography contains citations concerning motor-vehicle noise reduction through peripheral systems, tire, muffler, engine, and body design. Automobiles, trucks, buses, motorcycles, and other mobile vehicles are studied. External noise pollution reduction and vehicle interior-noise reduction for driver and passenger safety and comfort are considered. Noise reduction in aircraft is discussed in a separate bibliography. (This updated bibliography contains 278 citations, 105 of which are new entries to the previous edition.)

43666 (BNL–42659) **Internal audit criteria for industrial hygiene programs.** Brookhaven National Lab., Upton, NY (USA). Mar 1989. 86p. Sponsored by U.S. DOE Environment Health & Safety. DOE Contract AC02-76CH00016. Order Number DE89016124/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

An effective industrial hygiene program must comply with a variety of guidelines, regulations, and good practice procedures. New and changing regulations in the areas of toxic substances control, noise and hearing conservation, hazardous waste management, hazard communications, and cleanup of old disposal sites have added some extremely complex requirements. In response to these regulations, DOE instructions establish the basic requirements within DOE for conducting both functional and managerial appraisals of health and safety programs. Within this procedural framework, each DOE facility must conduct internal audits to assist in evaluating the effectiveness of the facility's industrial hygiene program and to identify potential noncompliance situations and future problem areas. This manual has been prepared for use by a DOE facility as an aid for conducting internal industrial hygiene program audit. The manual is organized in modular format, with each module covering a separate area of industrial hygiene. Each module has been structured to stand-alone with an overview, objective, scope, and interrogative checklist so that extensive time and effort need not be spent in developing narrative responses. For those questions requiring a written response, the reviewer is expected to supply only sufficient information to clarify an answer.

43667 (Juel-Conf–70) **Themes and tasks of risk communication. Proceedings.** Jungermann, H.; Kasperson, R.E.; Wiedemann, P.M. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). 1988. 193p. (CONF-8810410–: International workshop on risk communication, Juelich (Germany, F.R.), 17-20 Oct 1988). Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

This volume presents a set of papers from an international workshop on 'Risk Communication'. Although the researchers represented a wide range of disciplines and nationalities, their common interest were the problems of communicating about risks, particularly for health and environment, resulting from the development and application of modern technological systems and procedures. Whereas most people today have come to realize that in a democratic political system there is simply no alternative to open, honest, and extensive information and communication, most people also have come to realize that this is an extremely difficult, and sometimes dangerous, task, because informing about risk has itself a high risk of failure. The workshop presented, for the first time in the FRG, the theoretical concepts, empirical findings, practical experiences, and some conclusions. (orig./HSCH).

43668 (Juel-Conf–70, pp. 11-31) **Media reporting of risk information: Uncertainties and the future.** Peltu, M. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). 1988. (CONF-8810410–: International workshop on risk communication, Juelich (Germany, F.R.), 17-20 Oct 1988). In *Themes and tasks of risk communication. Proceedings.* Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

This paper argues that very little is known with a reasonable degree of certainty about how the media influence their audiences. Media effects are mediated through diverse, subtle social interactions and processes. Future changes in the regulatory and technological media environment will create even more uncertainty by changing basic parameters of media/audience interaction. More research is needed to help shed light on these uncertainties and

future changes. If this research is to be of relevance to real communicators of real risk, it must fully address the issues of how the media are influenced, not just media impacts. In this context, the role of experts, PR, advertising, and media professionals' motivations are key priorities. (orig.).

43669 (Juel-Conf–70, pp. 33-48) **The role of the media in risk communication.** Lichtenberg, J. (Maryland Univ., College Park (USA)); MacLean, D. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). 1988. (CONF-8810410–: International workshop on risk communication, Juelich (Germany, F.R.), 17-20 Oct 1988). In *Themes and tasks of risk communication. Proceedings.* Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

This paper analyses the origins of risk communication; why the role of the media is difficult to study; the relationship between media coverage and public opinion; the relationship between media coverage and 'reality'; some dilemmas for journalists; the politics of risk communication. More research needs to be done on this issue. Because of the complexities advances will depend partly on cooperation among risk analysts, communications experts, political theorists and philosophers; in any case, progress is likely to be slow and the research costly. The paper demonstrates: It matters greatly that journalists and the rest of us understand the context and the consequences of press coverage of risk issues. (orig./HSCH).

43670 (Juel-Conf–70, pp. 105-121) **Rights and duties concerning the availability of environmental risk information to the public.** Baram, M.S. (Boston Univ., MA (USA)). Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). 1988. (CONF-8810410–: International workshop on risk communication, Juelich (Germany, F.R.), 17-20 Oct 1988). In *Themes and tasks of risk communication. Proceedings.* Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

Both American and European societies are moving in the same direction - towards greater recognition of the need to make risk information available to the public, and greater reliance on communication as a policy instrument for reducing technological hazards. The American approach has been more expansive in providing information rights to the public and promoting public involvement in solving technical risk problems; but has not paid sufficient attention to actual performance problems, such as how to resolve disputes and systematically provide equivalent safety to all persons. The European approach has sought to maintain traditional joint responsibility of industry and government for systematically solving problems, but has resisted conferring public rights of access to industrial information which would permit the public to effectively participate in the development of the programs to prevent and respond to accidents. One can only conclude that each industrial society has much to learn from the other. (orig./HSCH).

43671 (Juel-Conf–70, pp. 155-157) **Results of the Working Group 'Risk Communications for Emergencies and Disasters'.** Sorensen, J.H. (Oak Ridge National Lab., TN (USA)); Dombrowsky, W.R. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). 1988. (CONF-8810410–: International workshop on risk communication, Juelich (Germany, F.R.), 17-20 Oct 1988). In *Themes and tasks of risk communication. Proceedings.* Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

Enhancing crisis communication is important to industry, government and the public. The public is becoming increasingly concerned about technological failures as our reliance on technology increases. Better preparedness and more public awareness can increase public acceptance of and confidence in ability to manage high consequence technologies including ability to manage its failures. Failed communications in emergencies has increased the loss of life and property and public scepticism. Effective communication can (a) engender confidence and trust in authorities; (b) give rise of acceptance of risks and risk management and (c) reduce the consequences of disasters. (orig./HSCH).

43672 (Juel-Conf–70, pp. 163-168) **Hazard versus outrage: A conceptual frame for describing public perception on risk.** Sandmann, P.M. (Rutgers - the State Univ., New Brunswick, NJ (USA)). Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). 1988. (CONF-8810410–: International workshop on risk communication, Juelich (Germany, F.R.), 17-20 Oct 1988). In *Themes and tasks of risk communication. Proceedings.* Available from Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Zentralbibliothek.

This is the fundamental premise of the author's argument: People's concerns and fears are more a product of outrage than of hazard. That is, we consistently underestimate the hazard of risks that are low-outrage, and overestimate the hazard of risks that are high-outrage. Everyone does this, even risk assessment experts when they are outside their own fields. The ability of risk assessment experts to define risk in terms of hazard and make it stick is an example of the power of expertise. Instead of comparing public perception of risk to expert knowledge it helps to see this as two different definitions of what risk means - the definition experts use on the job, which ignores outrage, versus the definition in everyday use, which emphasizes outrage. (orig./HSCH).

43673 (RVH–165D286) **Pathophysiology of surgical treatment of high voltage electrical injury.** Daniel, R.K. Royal Victoria Hospital, Montreal, PQ (Canada). 1988. 109p. (CE–02622). Available from Canadian Electrical Association, Research & Development, Suite #500, One Westmount Square, Montreal, PQ, CAN H3Z 2P9; $75.00 NON-MEMBERS; MEMBERS: PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

An experimental triphasic electrical injury model was developed in a primate showing injuries comparable to the clinical setting. This allowed easy, unobstructed evaluation of a reproducible upper extremity electrical injury. In the acute pathophysiology portion of the project, current repartition, temperature elevations, and voltage drops were evaluated. Experiments revealed an uneven flow of current through major muscle groups in the upper extremity. Average temperature elevations in areas corresponding to tissue necrosis were found to be significantly higher than those in viable tissues. Current passage through highly resistant bone and tendinous structures at the wrist and elbow were associated with significant potential drops. In the chronic portion of the project, an electrical burn model employing documentary and diagnostic techniques was designed in the primate to enable investigation of wound evolution for up to 10 days post burn. The techniques used to assess the electrical injury were gross observation, light microscopy, histochemistry and intracellular biochemistry, digital subtraction angiography, and ulnar nerve recordings. Characteristic patterns of tissue injury were recorded. No evidence was found to support the concept of progressive necrosis. This report is illustrated with numerous photographs, but the animals themselves are not presented or represented. A bibliography on electrical injuries is given. 54 refs., 29 figs., 1 tab.

43674 (VTT-TUTK–584) **Major hazards in industrial processes.** Pipatti, R. Valtion Teknillinen Tutkimuskeskus, Espoo (Finland). Feb 1989. 171p. (In Finnish). Order Number DE89902339/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

Major hazards in the Finnish chemical and process industries have been studied in the project. Risk factors associated with the process have been studied. Protective systems have not been considered. The probabilities of the accidents have not been estimated. The influence of factors like material properties, reaction types, process conditions and equipment on risks have been studied. Accidents that have happened in Finland and abroad have been studied to find factors that cause accidents and influence the consequences. Even accidents with only minor consequences and near misses have been studied. Major accidents are often caused by a series of technical and human faults. By preventing minor accidents one also prevents major accidents from happening. Industrial accidents are explosions, fires and releases of toxic or otherwise harmful materials to the environment. The major hazards of Finnish processes have been estimated from process descriptions. In accident prevention it is important to know the process hazards and to identify the risk factors. By using methods of risk analysis and laboratory tests you can prevent most of the accidents. The best results are achieved when one identifies the risks in the planning phase of the process.

43675 (DOE/NV/10322–37) **Geology of the U-1a.01 horizontal drift complex, southwestern Yucca Flat, Nevada Test Site.** Drellack, S.L. Jr.; Thompson, P.H.; Rayburn, C.J. Fenix and Scisson, Inc., Mercury, NV (USA). Mar 1989. 69p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC08-84NV10322. Order Number DE89015380/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

The U-1a.01 complex, site of a Los Alamos National Laboratory-sponsored experiment, is located in southwestern Yucca Flat on the Nevada Test Site. The complex is comprised of the vertical U-1a shaft, two large-diameter cable access holes, and approximately 229 m (750') of horizontal drift mined within alluvium 292.6 m (960') below the surface. Geologic mapping and related work at U-1a.01 afforded a unique opportunity to observe and evaluate the characteristics of alluvium in the subsurface of Yucca Flat, and to compare the results with surface and drill hole alluvium data. The Los Alamos Support Group of the Fenix and Scisson, Inc. Geology and Hydrology Division carried out a program of mapping, sampling and photography while mining was in progress, with the dual purpose of characterizing the geology of the site and documenting the mining operation. This report details the products and the results of that effort. 12 refs., 8 figs., 25 tabs.

43676 (SGS–9, pp. 77-82) **The Madison, a nomenclatural review with a look to the future.** Carlson, C.G. (North Dakota Industrial Commission, Bismarck, ND, USA); Lefever, J.A. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5th international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The difficulty of extending nomenclature applied to Madison strata of the outcrops in Montana into the subsurface in the Williston basin was recognized early and led to the addition of the Charles Formation ot the Madison Group in the subsurface of eastern Montana. Recognition of facies changes across the Basin led to the use of marker horizons to delineate marker-defined units within Madison strata on the east flank of the Basin. Numerous terms were introduced for marker-defined units and different horizons were used in different areas for similar terms. Exploration has now provided a means for establishing the stratigraphic relationships of the marker-defined units, and a review of the stratigraphic code provides a basis for clarifying nomenclature. It is herein proposed that the lithostratigraphic terms Madison Group, Charles, Mission Canyon, and Lodgepole Formations be retained as formal stratigraphic units. The facies relationships of the evaporites and carbonates are recognized by placing the Charles-Mission Canyon contact at progressively lower stratigraphic horizons towards the east flank of the Basin, so that the lowest evaporites are in the Charles Formation. The marker-defined units or marker horizons are considered informal units and may be referred to as intervals, subintervals, cycles, formats, marker horizons, or facies. 31 refs 3 figs

43677 (SGS–9, pp. 83-97) **Corals from the Madison Group, Williston Basin, North Dakota.** Waters, D.L. (ARCO Alaska Inc., Anchorage, AK, USA); Sando, W.J. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5th international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Corals are among the few fossils that have proved useful for dating and correlating Mississippian rocks in the Williston Basin. Study of cores from the Madison Group (Mississippian) in 29 wells in the Williston Basin of North Dakota revealed a coral fauna represented by eleven species and four morpho-groups belonging to the genera Amplexocarinia, Amplexizaphrentis, Cyathoxonia, Lophophyllum, Michelinia, Siphonodendron, Stelechophyllum, Synchoelasma, Syringopora, and Vesiculophyllum. Four zonules based on corals are sueful for correlation of Mississippian rocks within the area studied. Stelechophylum micrum and S. banffense are recorded in the conterminous United States for the first time. 40 refs 8 figs

43678 (SGS–9, pp. 98-106) **Waulsortian-type mounds in the Mississippian of the Williston Basin. New interpretation from old cores.** Sereda, R.D. (Univ. of Saskatchewan, Saskatoon, SK, Canada); Kent, D.M. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

There has been some speculation on the existence of Waulsortian-type mounds in the Mississippian formations of the Williston Basin but, to date, little evidence has been found to make any positive identification. Location and recognition of mounds in the subsurface can be based on the geometry and composition of outcropping mounds of Mississippian to Permian ages in various parts of the Rocky Mountain region, as well as on their paleogeographic and paleotectonic settings. Mounds in the Mississippian of the Williston Basin sould be expected on positive elements created by repeated basement block paleotectonic or syn-depositional salt solution. Two cores from the Souris Valley beds of extreme southeastern Saskatchewan contain lithologies that can be interpreted as representing mound or associated strata. One core contains unstratified lime mudstones with crinoidal debris in a geological setting in which surrounding cored wells reveal thinly bedded typical slope lithologies. The second core consists of streeply dipping crinoidal debris in a geological setting in which surrunding cored wells reveal thinly beded typical slope lithologies. The second core consists of steeply dipping crinoidal grainstones and packstones. Neither core features well developed reservoir rock, but Waulsortian-type mounds yield oil elsewhere. The reservoir potential of mounds in the Williston Basin depends on porosity enhancement by either dolomitization or exhumation of primary porosity by solution of pore-filling cements. 36 refs., 12 figs.

43679 (SGS–9, pp. 68-76) **Summary of the biostratigraphy of the Bakken Formation (Devonian and Mississippian) in the Williston Basin, Noth Dakota.** Holland, F.D. (Univ. of North Dakota, Grand Focks, ND, USA); Hayes, M.D.; Thrasher, L.C.; Huber, T.P. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Originally described as Mississippian, the Bakken Formation has been correlated with both Devonian and Mississippian outcropping units in nearby states and provinces. Studies of 95 form-species of conodonts and more than 500 macrofossils in 50 taxa from 30 cores now allow more accurate Bakken biozonation in North Dakota. The Bakken, up to 45 m thick, is as old as the Late Famennian Lower Palmatolepis gracilis expansa Biozone and as young as the Kinderhookian Lower Siphonodella crenulata Biozone. A lower, black-shale member, <16 m thick, has a brachiopod fauna in the bottom meter, conodonts perhaps as old as the Lower Palmatolepis perlobata postera Biozone, the alga Foerstia 2 m above the base, and abundant conchostracans marking the top. A middle member, lacking age-diagnostic conodonts, has been divided into three lithologic units. The systemic boundary has been placed at the base of

the second unit of the middle member. An upper black-shale member contains Siphonodella sulcata at the base, rare macrofossils, and perhaps as many as three Kinderhookian conodont biozones. Deposition of the upper member of the Bakken may have begun as early as the time of the late Upper S. duplicata Biozone although, more likely, it began in the time of the Lower crenulata Biozone. This biozone is represented in both the upper member of the Bakken and the lower part of the Lodgepole Formation. Above this, suggestion of the S. isosticha-Upper S. crenulata Biozone was found in the Lodgepole; but conodont numbers dwindled rapidly to disappearance by 15 m above the base of the Lodgepole, before the Kinderhookian-Osasgean boundary was reached. 69 refs 4 figs

43680 (SGS–9, pp. 37-46) **The Winnipegosis Formation of the northeastern margin of the Williston Basin.** Rosenthal. L.R. (Brandon Univ., Brandon, MB, Canada). Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

This study compiles a series of observations from outcrop exposure and drill cores of Winnipegosis strata in the Manitoba outcrop belt and proposes a depositional/diagenetic model which might aid explorationists working in the subsurface. The Winnipegosis is part of the Upper Elk Point (middle Devonian) formation that extends through Alberta and Saskatchewan. The Winnipegosis buildups studied in this report were deposited in a relatively deep marine basin flanking a broad carbonate platform. Four distinct lithostratographic facies are described, in ascending order: the Ashern Formation, the upper and lower Winnipegosis members, and the Prairie Evaporite residual clay horizon. Within these units, eight depositional facies are identified on the basis of primary textures, and two additional diagenetic facies which retained no relic depositional textures are also recognized. Interpretation of the depositional environment for each facies is given. An integrated core-outcrop model for Winnipegosis carbonates in Manitoba is then presented, and implications for exploration in the northern Williston Basin discussed. Points to be considered are the presence of true organic reefs, the lack of interdigitation of buildup and basin facies, and the fact that porosity is enhanced in, but not restricted to, the organic framework. 24 refs., 10 figs.

43681 (SGS–9, pp. 117-122) **Cyclicity in the Mission Canyon and lower Charles Formations of the central Williston Basin.** Hoff, J.L. (Univ. of North Dakota, Grand Forks, ND, USA). Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5th international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Statistical analysis was performed on 414 m of core from two formations in the Williston Basin. Carbonate and sulfate lithologies from the Ratcliffe, Frobisher-Alida, and Tilston intervals were sampled and examined for the presence of cyclicity. Presence-absence data were collected for 50 lithologic components. Similarity measures were calculated using the phi association coefficent. Unweighted pair-group mean clustering was performed on the similarity matrices. The significance of clusters was tested and clusters significant at the 99% level have distinct lithologic identities and are interpreted as lithofacies. Lithofacies were used as the mutually exclusive states required by numerical analysis of cyclicity. Iterative, simultaneous use of embedded Markov chain and mutual substitutability analyses was followed by examination of relative entropy patters. Markov property was determined to be present in each of the three wells studied. Two or more pairs of states were found to be mutually substitutable in each well. In all wells, patters of Markov dependencies were resolved into two cycles. Entropy patterns for all wells suggest that cyclicity in the central Williston Basin is symmetrical. No conclusions can be drawn from the depth distribution of lithofacies in well 7207. The stratigraphic distribution of lithofacies forming cycles in wells 793 and 1262 shows a clear and abrupt change from the more restricted marine facies in the upper portion of the cored interval, to the echinoderm-bearing carbonates or oolitic facies. This indicates abrupt rather than gradual introduction of more evaporative facies and control of upper and lower cyclicity by separately operating depositional mechanisms. 12 refs 7 figs 2 tabs

43682 (SGS–9, pp. 123-133) **Depositional cycles in the Mississippian Mission Canyon Limestone and Charles Formation, Williston Basin, North Dakota.** Waters, D.L. (ARCO Alaska Inc., Anchorage, AK, USA); Sando, W.J. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5th international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Study of 29 cores from wells in the Mission Canyon Limestone and Charles Formation resulted in recognition of five lithologic suites and two lithologic subsuites in each of three of these suites. These lithologic suites and subsuites represent the following depositional environments and subenvironments: supratidal-intertidal environment having sabkha, tidal flat and evaporitic ponds, and lagoons; intertidal environment which can, in some places, be differentiated into a subenvironment of low-energy accumulations of tidal ponds, drowned tidal flats, and possibly lagoons, or a subenvironment of higher-energy accumulations of shoals and tidal channels; restricted marine environment; transitional zone differentiated into a transitional zone between the restricted marine environment and open-marine environment; open-marine environment differentiated into a low-energy open-marine subenvironment, and a higher-energy open-marine subenvironment representing offshore shoals or submarine banks. Three regressive carbonate cycles that correspond to the Tilston, Frobisher-Alida, and Ratcliffe intervals of the upper part of the Madison are recognized. Each cycle shows a similar sequence of lithology, beginning at the base with rocks deposited under open-marine conditions and followed by rocks deposited in progressively shallower marine environments culminating at the top with rocks deposited in intertidal and supratidal environments. 19 refs 14 figs 1 tab

43683 (SGS–9, pp. 147-156) **Structural evolution of the central and southern portions of the Nesson Anticline, North Dakota.** Lefever, J.A. (North Dakota Geological Survey, Grand Forks, ND, USA); Lefever, R.D.; Anderson, S.B. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5th international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Nesson Anticline is the largest producing structural feature in the North Dakota portion of the Williston Basin. All of the Paleozoic formations which occur in the Williston Basin are present along at least part of the anticline and, of these, 14 produce in a total of 54 fields. Data were collected from oil well wireline logs along the portion of the anticline from Beaver Lodge Field to its southernmost extension in Rattlesnake Point Field. A total of 45 formation tops were picked from about 1300 well logs. From these data, isopach maps and structure contour maps were constructed for each of the formations. Where there were enough control points away from the structure, structural relief was determined. The Nesson Anticline in the study area is predominantly a north-south trending structure with slight irregularities in direction along the hinge trace. The fold opens up to the south, where it splits into several smaller secondary folds. Two faults are apparent from the structure maps: the main western Nesson fault which extends the length of the structure, and a fault on the northeast side of the Antelope anticline. There are

nine recognizable areas on the Nesson anticline in the study area. Structural activity in each area seems to have been essentially independent of the other areas. In most of the areas, the greatest movement along the anticline occurred during Devonian or Early Mississippian time, although there are some exception. Significant movement may have occurred prior to deposition of the Ashern formation, but the available data are too few to allow that interpretation. Structural activity in most areas appears to have been episodic, with few instatnce of prolonged movement. 10 refs 5 figs 3 tabs

43684 (SGS–9, pp. 157-168) **Salt dissolution and tectonics, south-central Saskatchewan.** McTavish, G.O. (Univ. of Regina, Regina, SK, Canada); Vigrass, L.W. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5th international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Subsurface dissolution of the Middle Devonian Prairie evaporite is a major structure-forming process in south-central Saskatchewan. The dissolution phenomenon is a multistage process of salt removal that entails collapse of the overlying sedimentray column and accelerated sedimentation into surface depressions produced during collapse. The process is important because it affects the sedimentation and diagenesis of younger strata and may produce structures suitable for petroleum entrapment. Linear dissolution trends which migrate laterally with time occur within the South Regina and Hummingbird Troughs. Analysis of structure contour, isopach and residual maps has yielded a chronology of dissolution events. Salinities (TDS) increase and hydraulic heads decrease as one moves eastward from a large salt-free area into the main salt body. Both composition of subsurface waters and fluid pressures suggest an upwelling of formation waters within the Hummingbird Trough. Within the map-area, two differing situations appear to affect salt dissolution. In the northeast, salt removal appears to be localized above porous and permeable Winnipegosis mounds of the Elk Point Basin. In the southwestern part of the study-area, underlain by the Winnipegosis marginal carbonate shelf, it seems likely that dissolution was localized by fracturing associated with diastrophic (deep-seated) structures.

43685 (SGS–9, pp. 169-177) **Structural history of Poplar Dome and the dissolution of Charles Formation salt, Roosevelt County, Montana.** Orchard, D.M. (BHP Petroleum (Americas) Inc., Englewood, CO, USA). Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5th international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Poplar Dome, in western Roosevelt County, Montana, is a major structural feature of the western Williston Basin. Approximately 150 ft of structural closure exists at the Mississippian Ratcliffe horizon. Minor structural movement occurred in the area of Poplar Dome during Mississippian through Cretaceous time. Much of the present structural relief is the result of Laramide uplift. Beds of salt in the Mississippian Charles Formation (Poplar interval) abruptly pinch out at Poplar Dome. Over 300 ft of salt from regionally extensive beds is missing on and near the structure. Nonsalt beds, however, extend across the dome with little thickness change and few facies changes. The stratigraphic evidence along with the presence of breccia in cores indicate that the salt beds were originally present on Poplar Dome but were subsequently dissolved. The dissolution was probably a Tertiary event caused by the introduction of fresh water along fractures induced by uplift. The removal of the salt caused collapse over the dome which affected the structural configuration of beds younger than the Charles Formation. In addition to the dissolution of salt beds, pore-filling salt has been dissolved from limestone of the Charles A and B units. The dissolution of this salt from Charles A porosity is related to the removal of bedded salt, while the flushing of salt from the Charles B porosity is related to a regional dissolution front encroaching from the southwest. Poplar Dome is the site of a major oil field which has yielded more than 45 million bbl of oil, primarily from the Charles B porosity. The removal of pore-filling salt from the Charles B was a critical factor in creating this oil accumulation. The removal of salt beds also allowed the upward migration of oil into reservoirs of the Charles A and the Pennsylvanian Tyler Formation. 20 refs 14 figs

43686 (SGS–9, pp. 107-116) **Environmental significance of a megaspore flora from the Mission Canyon Formation (Mississipian), Bottineau County, North Dakota.** Luther, M.R. (Univ. of North Dakota, Grand Forks, ND, USA); Steadman, E.N.; Hills, L.V. Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Megaspores and unidentified plant fragments have been recovered from two thin (0.5 m - 1.5 m) zones within carbonates of the Frobisher-Alida interval of the Mississippian Mission Canyon Formation. This flora was found during a study of the Wiley Field, southwestern Bottineau County, North Dakota. At least five new forms of megaspores were found, and are believed to represent previously underscribed genera and species of arborescent lycopods. Arborescent lycopods are typically associated with freshwater environments. The remarkable preservation, low diversity, and apparent areally restricted concentration of megaspores indicate growth at or near the place of deposition. This may provide evidence for local subaerial exposure and fresh-water lens development. Preserved organic fragments were deposited in nearby topographic lows. Organic plant and scolecodont material was preserved in an anoxic shallow water setting probably caused by saline brines. These brines dolomitized the sediments in which the organic material was preserved before significant compaction had occurred. 8 refs., 12 figs.

43687 (SGS–9, pp. 134-146) **A reconnaissance sedimentological study of the middle Jurassic upper Shaunavon Formation, southwest Saskatchewan.** Wilson, R.C.L. (The Open Univ. Milton Keynes, England). Saskatchewan Geological Society, Regina, SK (Canada). 1987. (CONF-8706400–: 5. international Williston Basin symposium, Grand Forks, U (USA), 14-17 Jun 1987; MICROLOG–87-06204). In *Proceedings of [the] fifth international Williston Basin symposium.* Available from Saskatchewan Geological Society, P.O. Box 234, Regina, SK, CAN S4P 2Z6; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

The Upper Shaunavon (15-25 m) is a mixed siliciclastic-carbonate unit. In the Rapdan and Dollard oilfield areas the lower part consists of quartz sands, calcareous shales, skelatal/peloidal packstones and grainstones that probably represent reworked relict sediments of a transgressive barrier island system. In the Instow-Bone Creek area the lower part is dominated by skeletal and ooid grainstones, some of which are producing reservoirs. Reservoir beds in the middle and upper parts consist of quartz and skeletal sands. Their porosity is enhanced by aragonite dissolution, and early freshwater phreatic calcite cement fringes ensured that little reduction of porosity occurred due to compaction during burial. Dolomitic sediments beneath, and on the flanks of reservoir units may have partially originated in the fresh-marine mixing zone, but some show features suggestive of an evaporative origin. The results of this study are consistent with earlier interpretations that envisage a north northeast-south southwest trending coastal barrier system. However, further detailed study of slabbed cores is needed to establish the extent to which wave and tidal processes sculptured Shaunavon reservoir units. 20 refs., 11 figs.

43688 (AD-A–205646/3/XAB) **Parallel processing for transient nonlinear structural dynamics of three-dimensional framed structures using domain decomposition.** Hajjar, J.F.; Abel, J.F. Cornell Univ., Ithaca, NY (USA). Mathematical Sciences Inst. 1988. 19p. Available from NTIS, PC A03/MF A01.

Pub. in Computers and Structures, Vol. 30, No. 6, 1237-1254(1988).

Nonlinear transient analysis of structures subjected to dynamic earthquake loading provides vital information for design and research. A strategy is presented for the solution of the fully nonlinear transient structural dynamics problem in a coarse-grained parallel-processing environment. Emphasis is placed on the analysis of three-dimensional framed structures subjected to arbitrary dynamic loading and, in particular, steel-building frames subject to earthquake loading. Concerns include long duration dynamic loading, geometric and material nonlinearity, and the wide distribution of vibrational frequencies found in frame models. The implicit domain decomposition method described employs substructuring techniques and then a preconditioned conjugate gradient algorithm for the iterative solution of the reduced set of unknowns along the substructure interfaces. Substructuring is shown to provide a natural preconditioner for effective parallel iterative solution.

43689 (AD-A–205986/3/XAB) **Dynaflow user's guide.** Prevost, J.H.; Slyh, R.; Hager, K. Naval Civil Engineering Lab., Port Hueneme, CA (USA). Nov 1988. 485p. (NCEL-UG–0014). Available from NTIS, PC A21/MF A01.

The Navy has $25 billion worth of facilities in seismically active regions. Each year $200 million of new facilities are added to those in seismically active areas. The Navy, because of its mission, must locate at the waterfront with a high watertable and often on marginal land. Seismically induced liquefaction is a major threat to the Navy. Presently, procedures do not exist to analyze the effect of liquefaction on structures. Developing an effective stress soil model will provide a tool for such analysis of waterfront structures. To understand the significance of liquefaction, it is important to note the damage caused in recent experiences. This study is directed toward examining the predictive capabilities of the numerical procedure proposed in a previous work titled studies of the capabilities of a soil model to predict axial drained/undrained responses of two sands.

43690 (AD-A–206979/7/XAB) **SeisMs.NORSAR: a seismic monitoring system. (User's guide). Final technical report, 1 March 1985-30 September 1988.** Science Horizons, Inc., Encinitas, CA (USA). 9 Nov 1988. 120p. (SH-R–4-88-2112). Available from NTIS, PC A06/MF A01.

SeisMs.NORSAR, a seismic monitoring system that is part of a joint effort by Norway and the United States is developed to relay real-time data streams generated from the ARCESS array located at Finmark (Karasjok) to the NORSAR acquisition site located at Kjeller, Norway. SeisMS. NORSAR consists of a communications hardware/software subsystem called a Communications Interface Module (CIM) and a near-real-time software subsystem for automated acquisition and processing of the seismic data. One CIM located at ARCESS receives the real-time array (hub) and high-frequency (HF) data streams, multiplexes them and retransmits the stream by satellite to the NORSAR sites. At NORSAR, a receiving CIM demultiplexes the data, buffers it if necessary, and relays the hub and HF data streams to a DCP board in a Sun Workstation. Data-acquisition software running in the workstation, diverts each data stream onto a circular buffet disk loop, from which all or selected portions of the raw data can be reformatted to conform to a CSS data base and archived to tape or written to a CSS database and archived to tape or written to a CSS data base on disk. This report includes information on CIM reference, CIM maintenance, using the data-acquisition software, and manual (man) page for user commands and required input file formats.

43691 (AD-A–207046/4/XAB) **Earthquake-induced liquefaction of fine-grained soils - considerations from Japanese research. Final report, October 1986-September 1988.** Koester, J.P.; Tsuchida, T. Army Engineer Waterways Experiment Station, Vicksburg, MS (USA). Geotechnical Lab. Dec 1988. 51p. (WES/MP/GL–88-34). Available from NTIS, PC A04/MF A01.

Liquefaction potential of various types of soils has received a great deal of research attention in the geotechnical community over the previous two decades. Dramatic occurrences of liquefaction in saturated deposits of fine, uniformly graded sands in the Japanese city of Niigata and surrounding areas resulting from ground shaking during the 16 June 1964 earthquake spawned extensive studies to develop methodologies for assessing the potential for liquefaction of predominantly clean sands throughout Japan and worldwide. Japanese researchers have recently performed laboratory and field studies to assess the influence of variations in grain-size distribution and soil-index properties of liquefaction potential of fine-grained soils. Several Corps of Engineers dams in seismically active areas are founded on fine-grained, low plasticity alluvial deposits. This report reviews current practices applied to study the phenomenon of fine-grained soil liquefaction, with emphasis on recent Japanese laboratory and in situ testing research. The findings will promote efficiency of effort in the conduct of subsequent laboratory-testing efforts toward the development of specific procedures for use by the Corps and others in assessing the potential for earthquake-induced liquefaction to occur in fine-grained soils.

43692 (CEA-DAS–599) **Stong movements data and simple criterion of damages.** Ferrieux, H. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. May 1989. 10p. (In French). (CONF-8904262–: 2. National Symposium on paraseismic engineering, 18-20 Apr 1989). Order Number DE89908185/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

When studying, from a statistical point of view, the damage that may be inflicted upon a heterogeneous population of structures without having recourse to the computation of the response of each, one considers ground motion parameters believed to be representative of the 'destructive potential' of the motion in question. In this study, an overview is made of the principal correlations that have been established between these different parameters and the damage observed, then new ones are elaborated and their relative value and realm of applicability are determined.

43693 (CEA-DAS–600) **Application test of data analysis for the research of a tectonic zoning of France.** Delouis, B.; Brenot, J.; Combes, P.; Goula, X.; Grimoud, J. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. May 1989. 10p. (In French). (CONF-8904262–: 2. National Symposium on paraseismic engineering, 18-20 Apr 1989). Order Number DE89908184/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

Up to now, characterization of homogeneous tectonic zones results essentially from the superposition of different geological thematic maps; with this approach, a tectonic zoning of France was established. A method of data analysis (principal components analysis) is used to study the statistical relationships between different factors describing the state of the earth crust in France; a tectonic picture is obtained which is compared with the previous zoning.

43694 (CEA-DAS–601) **Prevision of high seismic movements from studies on weak movements: methodological review.** Mohammadioun, B. CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. d'Analyse de Surete. May 1989. 10p. (In French). (CONF-8904262–: 2. National Symposium on paraseismic engineering, 18-20 Apr 1989). Order Number DE89908183/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

In most seismic areas of the world, the major earthquakes occurring there have not been recorded in the near field by adequate instruments. The calculation of seismic motion for engineering purposes, to be used in the anti seismic design of sensitive facilities, is accordingly based upon data mainly from California, and which bear the mark of the seismotectonic features of this part of the world. On the other hand, various seismic monitoring networks in France and neighboring countries have made it possible to put together an extensive collection of moderate-magnitude recordings. The object of this contribution is to conduct a critical analysis of the methods called upon in the prediction of strong ground motion that use European moderate-magnitude earthquake data, which, as in the case of severe earthquakes, reflect their corresponding path effect. This

analysis focusses more particularly on the degree of validity of the hypotheses involved in the aforementioned predictions.

43695 (ENEA-RT-PAS–85-3) **ENEA Southern Latium (Italy) seismic array.** Cervellati, R.; Cochi, C.; Vitiello, F. ENEA, Casaccia (Italy). Dipt. Protezione Ambientale e Salute dell'Uomo. Mar 1985. 74p. (In Italian). Order Number DE89761958/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

The planning and development of ENEA's (Italian Commission for Nuclear and Alternative Energies) Southern Latium Seismic array are described. The paper describes the geology of the region and discusses why ENEA chose this area to carry out seismotectonic research. It contains a detailed description of each seismic station and the signal teletransmission method, which made possible the coverage of an uneven orographic area with a point-to-point radio relay system. Finally it describes the acquisition of seismic data in Casaccia.

43696 (ENEA-RT-PAS–85-6) **Electric grounding for ENEA (Italy) seismic array.** Cervellati, R.; Vitiello, F. ENEA, Casaccia (Italy). Dipt. Protezione Ambientale e Salute dell'Uomo. Apr 1985. 17p. (In Italian). Order Number DE89761959/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The paper describes the earthing system employed to shield the ENEA (Italian Commission for Nuclear and Alternative Energies) seismic stations from atmospheric discharges. The system was used for the seismic arrays of Southern Latium and Brasimone, Italy. The initial implementation of this system was carried out with excellent results.

43697 (INFO–0265) **Neotectonics in the maritime provinces.** Martin, G.L. Atomic Energy Control Board, Ottawa, ON (Canada). Mar 1988. 123p. Order Number DE89635115/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

Seismic risk assessment in the Maritime Provinces requires input from not just historical, but also geological sources. A detailed search through published and unpublished geological literature reveals many examples - some probable, some possible -of neotectonic movement in the area. Examples range in tectonic significance from those that reflect exaggerated local imbalance to those that signify deep-seated stress. Evidence for neotectonism in the Maritimes is multidisciplined. It includes deformation in bedrock and quaternary deposits, and regional warping. Recent movement also is indicated by changes in relative sea level, in situ stress fields and geodetic fluctuations. Finally, and most unequivocally, neotectonism in the Maritime Provinces is manifested as the seismic events that have sporadically affected the area throughout its recent geological history, and continue up to the present day. 288 refs.

43698 (PB–89-178826/XAB) **Cone penetration testing for evaluating the liquefaction potential of sands. Master's thesis.** Carter, R.R. Bureau of Reclamation, Denver, CO (USA). May 1988. 69p. (REC-ERC–87-9). Available from NTIS, PC A04/MF A01.

Before the Niigata and Alaskan earthquakes of 1964, most geotechnical engineers had expressed little concern about the dynamic behavior of saturated sand layers. Regardless of their density, sands were generally considered quite incompressible and stable for foundation and construction uses. The only disadvantages for the universal use of sands considered were the consequences of their high permeabilities. Damage to many structures founded on saturated sand beds and other physical signs of loss of strength in sand layers during the two 1964 earthquakes resulted in the formation of a new area of geotechnical engineering. A new term, 'liquefaction,' was coined to describe the more visible outcomes of earthquake-related failures.

43699 (SKB-TR–89-01) **Near-distance seismological monitoring of the Lansjaerv neotectonic fault region. Pt. 2: 1988.** Wahlstroem, R.; Linder, S.O.; Holmqvist, C.; Maartensson, H.E. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1989. 23p. Order Number DE89912024/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

During five months in 1988, a mobile seismic network (six stations) was operated near the Lansjaerv neotectonic fault in Swedish Lapland. This was a continuation of an investigation in the same area in 1987. Some 30 local earthquakes were recorded, 18 of which have been located. A restrained focal depth has been obtained for six of these, and the depths range from 5 to 12 km. There is no clear spatial association of the earthquakes with the lateglacial fault segments, but many epicentres lie close to an older fault with the trend perpendicular to that of the lateglacial fault segments. Seismic moments from 10^{10} to 10^{12} Nm, fault radii 30-100 m, average dislocations 0.03-3 mm and stress drops 0.01-4 MPa have been computed from Sg-wave amplitude spectra. Focal mechanisms are not well constrained due to the small number of stations, and their tectonic interpretation is uncertain. (orig.).

43700 (EMR/MR–88-128) **Results of shear testing on jointed Paradise River specimens.** Jackson, R. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Mining Research Labs. [1989]. 46p. (MICROLOG–89-02174). Available from Canada Centre for Mineral and Energy Technology, Technical Information Division, 562 Booth St., Room 20C, Ottawa, ON, CAN K1A 0G1; PRICES UPON REQUEST, FUNDS CAN; MF CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $10 CAN.

Direct shear tests were conducted on seven jointed banded tuff specimens obtained from the Paradise River hydro-electric project by ShawMont Newfoundland Limited. The specimens constituted two sets of joint types, planar and kink banded. Shearing was performed under normal loads of 500, 1000, and 1500 kilopascals for each joint type. 1 ref., 25 figs., 2 tabs.

43701 Mechanics of slip and fracture along small faults and simple strike-slip fault zones in granitic rock. Martel, S. J. (Earth Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California (US)); Pollard, D. D. *Journal of Geophysical Research (USA)*, 94(B7): 9417-9428 (10 Jul 1989).

We exploit quasi-static fracture mechanics models for slip along pre-existing faults to account for the fracture structure observed along small exhumed faults and small segmented fault zones in the Mount Abbot quadrangle of California and to estimate stress drop and shear fracture energy from geological field measurements. Along small strike-slip faults, cracks that splay from the faults are common only near fault ends. In contrast, many cracks splay from the boundary faults at the edges of a simple fault zone. Except near segment ends, the cracks preferentially splay into a zone. We infer that shear displacement discontinuities (slip patches) along a small fault propagated to near the fault ends and caused fraturing there. Based on elastic stress analyses, we suggest that slip on one boundary fault ends and caused fracturing there. Based on elastic stress analyses, we suggest that slip patches preferentially led to the generation of fractures that splayed into the zones away from segment ends and out of the zones near segment ends. We estimate the average stress drops for slip events along the fault zones as ~1 MPa and the shear fracture energy release rate during slip as 5×10^{2}–2×10^{4} J/m^2. This estimate is similar to those obtained from shear fracture of laboratory samples, but orders of magnitude less than those for large fault zones. These results suggest that the shear fracture energy release rate increases as the structural complexity of fault zones increases. © American Geophysical Union 1989

43702 Transport of fluid and electric current through a single fracture. Brown, S. R. (Geomechanics Division, Sandia National Laboratories, Albuquerque, New Mexico (US)). *Journal of Geophysical Research (USA)*, 94(B7): 9429-9438 (10 Jul 1989).

One expects the hydraulic and electrical conductivities of rock to be related, since there is an analogy between the differential equations describing each process. Fractures in rock are commonly described by the parallel plate model, where the fracture surfaces are smooth and parallel with a separation or aperture of d. For this model the hydraulic conductivity is proportional to d^3, whereas the electrical conductivity is proportional to d. Deviations from the parallel plate model are expected, since real fracture surfaces are rough and in partial contact. Computer simulations of fluid flow and conduction of electricity were performed on simulated fractures

composed of rough surfaces generated with a fractal algorithm. The finite difference method was used to calculate the volume flow rate and electric current. This solution was used in the parallel plate model to get an effectie hydraulic aperture d_h and electric aperture d_e. The electric and hydraulic apertures are nearly the same when the surfaces are widely separated. However, d_e is always smaller than d_h, with the difference increasing as the fracture closes. Additionally, the local directions of fluid flow and electric current are not the same. Thus contrary to the common assumption, the actual path length of a fluid particle as measured by the tortuosity is different for each process. The results of these simulations are consistent with the "equivalent channel model," which shows that by introducing the tortuosity of the fluid flow or electric current paths, one can relate the microscopic physics of the transport properties to the macroscopic behaviors described by Darcy's and Ohm's laws. © American Geophysical Union 1989

43703 Regional trends in the oxygen isotopic compositions of granitoid plutons, central and southern Appalachians. Wesolowski, D. (Oak Ridge National Laboratory, TN (USA)); Sans, J.R.; Thornton, C.P.; Ohmoto, H. *Geological Society of America, Abstracts with Programs (USA)*, 17: 748 (1985). (CONF-8510489–: 98. annual meeting of the Geological Society of America, Orlando, FL (USA), 28-31 Oct 1985).

Whole-rock oxygen isotope analyses of 125 samples from 87 plutons, together with average values from 20 additional plutons reported by Wenner (1981) and Casadevall and Rye (1980), representing nearly every major post-Grenville pluton of the crystalline Appalachians of Maryland-Alabama, are summarized. The high-^{18}O granitoids of the Blue Ridge, Ashland-Wedowee, and Inner Piedmont belts are indicative of source regions with a substantial metasedimentary component. The absence of high-^{18}O granitoids in the Slate Belt throughout its Precambrian-Hercynian intrusive history suggests an oceanic crust beneath this terrane, although meteoric water-rock interaction may have affected many of these plutons. The Charlotte and Raleigh belts contain plutons with $\delta^{18}O_{wr}$ ranges intermediate between these two extremes. High-^{18}O Hercynian plutons of the Kiokee (Clouds Creek, Edgefield) and "?" belts (terrane east of the Raleigh and north of the Eastern Slate Belt containing the Petersburg, Fallmouth and Gunpowder intrusives) suggest a significant metasedimentary component in the source regions of the youngest and eastern most of the Southern Appalachian intrusives.

43704 Stable isotope and fluid inclusion studies of metamorphic fluid flow in an evolving tectonic system. Wesolowski, D. (Oak Ridge National Laboratory, TN (USA)); Cole, D.R.; Drummond, M.S.; Stakes, D.R. *Geological Society of America, Abstracts with Programs (USA)*, 17: 748 (1985). (CONF-8510489–: 98. annual meeting of the Geological Society of America, Orlando, FL (USA), 28-31 Oct 1985).

The Southern Appalachian borehole represents a unique opportunity to couple O-H-C-S isotope and fluid inclusion studies with textures, mineralogies, and chemical compositions in order to assess the role of fluids in metamorphism, deformation, element migration, and heat transfer throughout the evolution of a complex orogen. Studies which focus on hydrothermal veins, felsic/mafic intrusives and juxtaposed but chemically and isotopically distinct lithologies such as volcanics/-clastics and silicates/carbonates will be particularly informative. That large-scale metamorphic fluid flow has occurred in the Southern Appalachians is evidenced by devolatilization of enormous masses of rock during prograde metamorphism and extensive revolatilization, along major shear zones exhibiting retrograde assemblages. The authors own textural, chemical and oxygen isotope studies of granitoids and their host rocks in Northern Alabama document substantial isotopic, major and trace element (e.g. U, Th, Pb, Rb, and Sr) redistribution over thousands of cubic kilometers via exchange with infiltrating metamorphic fluids. Even chemically and mineralogically unaltered granites in the area have been isotopically enriched, perhaps reflecting differing chemical and isotopic exchange capacities of the fluid/rock system. These observations suggest that the chemical and isotopic effects of metamorphic fluid flow must be quantified in order to determine the origins of sedimentary and igneous rocks based on their geochemical signatures and age dates and to evaluate the role of fluids in the tectonic evolution of the proposed study area.

43708 (AD-A–205324/7/XAB) **Extended solar-activity cycle.** Wilson, P.R.; Altrock, R.C.; Harvey, K.L.; Martin, S.F.; Snodgrass, H.B. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 23 Jun 1988. 4p. (AFGL-TR–89-0047). Available from NTIS, PC A02/MF A01.

Pub. in Letters to Nature, Vol. 333, 748-750(23 Jun 1988).

The solar cycle has been defined in terms of a sequential periodic variation in sunspot numbers, the period being the interval between successive minima, currently averaging 11.2 years. But a number of observations have indicated that the activity cycle may begin at higher latitudes before the emergence of the first sunspots of the new cycle. Here results are reported from sunspot cycle 21 concerning the ephemeral active regions, the coronal green-line emission and the torsional oscillation signal, which confirm the earlier suggestions. The appearance of a high-latitude population of ephemeral active regions in the declining phases of sunspot cycle 21, is reported with orientations that tend to favor those for cycle 22 rather than 21. Taken together, these data indicate that sunspot activity is simply the main phase of a more-extended cycle that begins at high latitudes before the maximum of a given sunspot cycle and progresses towards the equator during the next 18-22 yr, merging with the conventional 'butterfly diagram' (the plot of the latitudes of emerging sunspots against time) as it enters sunspot latitudes. This extended cycle may be understood in the perspective of a model of giant convective rolls that generate dynamo waves propagating from pole to equator.

43709 (AD-A–205326/2/XAB) **Image processing of coronal pictures.** Smartt, R.N.; Koutchmy, O.; Koutchmy, S.; Nitschelm, C.; Sykora, J. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 28 Feb 1989. 13p. (AFGL-TR–89-0060). Available from NTIS, PC A03/MF A01.

Coronal images contain many complex, superposed, faint, optically-thin structures: Rays, loops, curved streamers, etc. The spatial resolution is often limited by the signal/noise ratio in the recording medium while the dynamic range in intensity is severely dominated by the radial gradient. The results obtained with a new simple image-processing algorithm are applied to several typical eclipse and coronographic pictures. This 2D filter (second-order difference operator in k-direction) shows superior quality by improving the signal/noise ratio, reducing the dynamic range and enhancing faint coronal structures. A comparison with results obtained with more commonly used 2D filters is also presented. The algorithm used here are briefly described, together with discussions of enhanced coronal images of coronal physics interest.

43710 (AD-A-205384/1/XAB) **Effects of acoustic and gravity waves on the curve of growth.** Marmolino, G. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1987. 16p. (AFGL-TR-89-0053). Available from NTIS, PC A03/MF A01.

Pub. in Solar Physics, Vol. 112, 211-226(1987).

Unresolved motions, or microturbulence, play a very important role in determining the Doppler width of the line-absorption coefficient. The concept of microturbulence was introduced because observed solar and stellar lines are broader than is explicable within the framework of other line broadening mechanisms. By constructing a curve-of-growth in the presence of a dynamical model for simple acoustic and gravity waves, this paper evaluates the errors introduced by the use of kinematic models for line-broadening (microturbulence) into determinations of non-thermal velocity fields and element abundances. Distinct differences between gravity and acoustic waves are apparent in the trend of the line asymmetry with the excitation potential as well as in the magnitude of the errors introduced by the temperature and pressure variations associated with the velocity field.

43711 (AD-A-205538/2/XAB) **Small-scale coronal structures.** Koutchmy, S.L. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1988. 29p. (AFGL-TR-89-0056). Available from NTIS, PC A03/MF A01.

Pub. in Solar and Stellar Coronal Structure and Dynamics: A Festschrift in Honor of Dr. John W. Evans, 208-235(1988).

A few problems connected with the observation and analysis of fine-scale coronal density structures are reviewed. The inner corona and middle corona are considered. The relations existing between the coronal magnetic fields and coronal dynamics at small scale are emphasized, including impulsive events.

43712 (AD-A-205649/7/XAB) **Study of the infrared celestial background. Final report, 1 February 1985-31 January 1988.** Bentley, A.F. Eastern Montana Coll., Billings, MT (USA). Dept. of Physical Sciences. 30 Sep 1988. 67p. Available from NTIS, PC A04/MF A01.

The following revised objectives were formulated: to determine the nature of infrared sources observed; to carry out theoretical investigations on the nature and evolution of selected infrared sources; and to establish the statistical distribution of infrared-sources in space to a sensitivity limit and spatial resolution consistent with available observing equipment and techniques. Research on infrared sources in the W40 complex was published. Results of radio and infrared observations of OH/IR stars in the Galaxy were published. A theoretical study of the possibilities for observation of galaxies in the process of formation in the early universe was published in the Proceedings of the Montana Academy of Science. The results of a series of observations made on Nova Vulpeculae 1984 2 were published. Preliminary results on studies of the infrared properties of the nuclei of planetary nebulae were presented. A theoretical model was constructed for transfer of cosmic ray energy to emission nebulae.

43713 (AD-A-205762/8/XAB) **Stellar activity and the rotation of Hyades stars.** Radick, R.R.; Baliunas, S.L. Air Force Geophysics Lab., Hanscom AFB, MA (USA). Dec 1987. 4p. (AFGL-TR-89-0049). Available from NTIS, PC A02/MF A01.

Pub. in Cool Stars, Stellar Systems and the Sun V, Vol. 291, 217-219(Dec 198).

New measurements of rotation periods for Hyades stars, which were obtained from re-analysis of Mount Wilson Observatory Ca II H-K emission flux measurements, are reported. The existence of systematic, color-dependent discrepancies between the measured rotation periods for Hyades stars and those predicted by the Rossby relation as originally calibrated by Noyes et al. 1984 has led to a re-examination of the form of the relationship between chromospheric emission, rotation, and color.

43714 (AD-A-205763/6/XAB) **Broadening and shift of Fe I lines perturbed by atomic hydrogen.** Gomez, M.T.; Marmolino, C.; Roberti, R.; Severino, G. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1987. 8p. (AFGL-TR-89-0051). Available from NTIS, PC A02/MF A01.

Pub. in Solar Physics, Vol. 112, 227-232(1987).

The broadening and shift parameters for a number of Fe I lines perturbed by atomic hydrogen are computed using the interatomic potential due to Hindmarsh et al (1967, 1970). It is also shown that the rms radius and the effective radius of the radiating atom, which determine the force constants in the interatomic potential, can be simply related to each other depending on the orbital quantum number of the atomic level.

43715 (AD-A-205764/4/XAB) **Rotation characteristics of the Fe XIV (5303 A) solar corona.** Sime, D.G.; Fisher, R.R.; Altrock, R.C. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1 Jan 1989. 16p. (AFGL-TR-89-0052). Available from NTIS, PC A03/MF A01.

Pub. in Astrophysical Jnl. Vol. 336, 454-467(1 Jan 1989).

Synoptic photoelectric observations of the coronal Fe XIV line at 5303 A were analyzed to reveal the rotational behavior of the solar corona as detected in that line. A correlation analysis shows that the average synodic rotation period for a band from 30N to 30S was 27.52 days. Although the lifetimes for features in the Fe XIV corona are slightly less than those for the electron corona, overall, their rotation properties are more similar to the white-light corona than to those of active regions on the Sun with which they are generally thought to be associated. However, there appears to be a significant and time-varying component which shows differential rotation. This component appears during cycle 21 at high 7 or 60° latitudes in the late ascending phase and moves toward the equator. As the cycle progresses, the component becomes indistinguishable from faster rotating features near the equator and the effect is to produce a net differential rotation intermediate between that of the photosphere and that of the white-light corona. The observations appear to be consistent with the interpretation that the Fe XIV coronal signal arises from the effects of local heating on the large-scale density structure of the corona.

43716 (AD-A-205765/1/XAB) **Solar-cycle variations of coronal neutral lines and polar regions activity.** Makarov, V.I.; Makarova, V.V.; Koutchmy, S.; Sivaraman, K.R. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1988. 16p. (AFGL-TR-89-0059). Available from NTIS, PC A03/MF A01.

Pub. in Solar and Stellar Coronal Structure and Dynamics: A Festschrift in Honor of Dr. John W. Evans, 362-375(1988).

Observations of the corona, of prominences, of polar faculae and of large scale magnetic fields show solar activity over all latitudes, in contrast with sunspot activity, which is limited to mid-latitudes. The global behavior of the solar activity is considered here thanks to the analysis of chromospheric synoptic maps which include the location of Hα and Ca II k prominences. The process of migration of neutral lines during the cycle (supposed to represent the large-scale coronal magnetic field) is shown. After subsequent averaging of the maps, a discrete number of latitude zones is found: not more than 10, the most probable number being 3 or 5. This suggests the occurrence of dominant modes (1=3 and 1=5) of the large-scale coronal magnetic field and inferred coronal structures for different epochs of the solar cycle. The geoactivity of coronal streamers could be related to the modes, noticing the dipole (1=1) mode is almost absent. A more-detailed analysis points to the importance of the poleward migration of neutral lines (with v = 5 to 40 micro sec-1). The nonsymmetric behavior of the N and S hemisphere as well as the erratic behavior of the corresponding sunspot activity in each hemisphere is emphasized, which reflects the behavior of both the radial component and the toroidal component of the field.

43717 (AD-A-205766/9/XAB) **Solar emission-line corona: current and future ground-based observational research.** Altrock, R.C. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1988. 5p. (AFGL-TR-89-0057). Available from NTIS, PC A02/MF A01.

Pub. in Solar and Stellar Coronal Structure and Dynamics: A Festschrift in Honor of Dr. John W. Evans, 288-291(1988).

This is a review of the status of ground-based solar coronal research that took place during the Workshop on Solar and Stellar Coronal Structure and Dynamics. Topics of discussion included current observational capabilities, research problems suitable for attack now and in the future, and possible future instrumentation, including the Advanced Reflecting Coronagraph.

43718 (AD-A-205767/7/XAB) **Variation of solar coronal Fe XIV 5303 A emission during solar cycle 21.** Altrock, R.C. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 1988. 9p. (AFGL-TR-89-0058). Available from NTIS, PC A02/MF A01.

Pub. in Solar and Stellar Coronal Structure and Dynamics: A Festschrift in Honor of Dr. John W. Evans, 414-420(1988).

Investigation of the behavior of coronal intensity above the limb in Fe XIV emission (5303 A) obtained at Sacramento Peak Observatory over the last fourteen years resulted in the confirmation of a second set of zones of solar activity at high latitudes separate from the Main Activity Zones (MAZ). Localized emission peaks in Fe XIV 5303 A are observed through most of the cycle at latitudes in individual daily scans, annual averages, and solar-cycle summary plots of the location of all local maximum intensities at 0.15R above the limb. These peaks evolve slowly over a period of days, consistent with the rotation over the limb of stable features, in a similar way to the lower-latitude peaks connected with active regions. The high-latitude coronal-activity zones first appear at latitudes of 70 to 80 deg, 2-3 years after solar minimum. They evolve approximately parallel to the MAZ, with the average latitude decreasing at rate of roughly 5-6 deg per year. After their appearance, they are present more or less continuously until the following solar minimum. Near solar minimum, the high-latitude coronal activity zones that appeared after the beginning of Cycle 21 monotonically evolved into the MAZ of Cycle 22. It thus appears that we have evidence for parallel overlapping solar cycles that begin every 11 years but last for approximately 19-20 years.

43719 (AD-A-206052/3/XAB) **Geomagnetic disturbances. Final report, 1 October 1985-30 September 1988.** Scherrer, P.H. Stanford Univ., CA (USA). Center for Space Science and Astrophysics. Jan 1989. 32p. Available from NTIS, PC A03/MF A01.

Investigations included observations and analysis of the solar and interplanetary quantities relevant to geomagnetic activity. The operation of the Wilcox Solar Observatory and analysis of the synoptic observations of magnetic fields has constituted a significant part of the effort. Emphasis has been to attempt to understand the timing and severity of geomagnetic disturbances by understanding the solar mechanisms responsible for the origin of solar wind variations.

43720 (AD-A-206335/2/XAB) **Ground-based infrared observations of sources discovered by the AFGL, FIRRSE and IRAS infrared surveys. Final report, 15 July 1984-14 July 1987.** Spillar, E.J. Wyoming Univ., Laramie, WY (USA). Dept. of Physics and Astronomy. 30 Jun 1988. 4p. Available from NTIS, PC A02/MF A01.

The contracts research objective was to understand the infrared sources discovered by the AFGL, FIRRSE and IRAS Infrared Surveys. Work has continued on young stellar objects with a variety of collaborators. In particular, extensive infrared and radio observations have yielded new information on the true nature of this highly energetic outflow object. Particular results are the lack of a disk and the resolution of accelerated shells. High-resolution maps have been made of several other young stellar objects in an effort to understand the energetics and nature of the objects. The group has continued its investigation of comets. Comets investigated include Giacobini-Zinner and Halley. Emphasis has been on understanding the emission from the dust in these objects. Because of the changing illumination of these dust grains, and the well understood geometry of comets, these objects provide unique information on interstellar dust.

43721 (AD-A-206666/0/XAB) **Evolution of solar magnetic flux.** Boris, J.P.; DeVore, C.R.; Golub, L.; Howard, R.F.; Howard, R.H. Air Force Geophysics Lab., Hanscom AFB, MA (USA). Feb 1989. 5p. (AFGL-TR-89-0055). Available from NTIS, PC A02/MF A01.

Pub. in Solar Terrestrial Physics: Present and Future, 33-34(Feb 1989).

This review concentrates on what can be deduced from observations by addressing four question that shape the discussion. (1) How does flux emerge on the Sun. (2) How does magnetic flux disappear. (3) What is seen at the limits of resolution. (4) What large-scale patterns are detected. The answer to the fundamental question, How the solar dynamo works, can only evolve from interpreting clues uncovered in research aimed at illuminating various aspects of these more 'visible' questions.

43722 (DOE/ER/40317-T1) **Research in nuclear astrophysics: Stellar collapse and supernovae, progress report.** Lattimer, J.M.; Yahil, A. State Univ. of New York, Stony Brook, NY (USA). [1989]. 28p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER40317. Order Number DE89016630/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The interaction between nuclear theory and some outstanding problems in astrophysics is examined. We are actively researching both the astrophysics of gravitational collapse, neutron star birth, and the emission of neutrinos from supernovae, on the one hand, and the nuclear physics of the equation of state of hot, dense matter on the other hand. There is close coupling between nuclear theory and the supernova phenomenon; in fact, nuclear matter properties, especially at supernuclear densities, might be best delineated by astrophysical considerations. Our research has also focused on the neutrinos emitted from supernovae, since they are the only available observables of the internal supernova mechanism. The recent observations of neutrinos from SN 1987A proved to be in remarkable agreement with models we pioneered in the one and one half years prior to its explosion in February 1987. We have also developed a novel hydrodynamical code in which shocks are treated via Riemann resolution rather than with artificial viscosity. We propose to modify it to use implicit differencing and to include multi-group neutrino diffusion and General Relativity. In parallel, we are extending calculations of the birth of a neutron star to include convection and mass accretion, by incorporating a hydrodynamic envelope onto a hydrostatic core. In view of the possible recent discovery of a pulsar in SN1987A, we are including the effects of rotation. We are undertaking a detailed comparison of current equations of state, focusing on disagreements regarding the nuclear incompressibly, symmetry energy and specific heat. Especially important is the symmetry energy, which below nuclear density controls free proton fractions and weak interaction rates and above this density critically influences the neutron star maximum mass and binding energy. 60 refs.

43723 (ENEA-RT-TIB-88-23) **Proposal of comparative Maunder minimum cosmogenic isotope measurements.** Attolini, M.R.; Nanni, T.; Galli, M.; Salomoni, A.; Povinec, P. ENEA, Rome (Italy). 1989. 9p. Order Number DE89634521/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

There are at present contraddictory conclusions about solar activity and cosmogenic isotope production variation during Maunder Minimum. The interaction of solar wind with galactic cosmic rays, the dynamic behaviour of the Sun either as a system having an internal clock, and/or as a forced non linear system, are important aspects that can shed new light on solar physics, the Earth-Sun relationship and the climatic variation. An essential progress in the matter might be made by clarifying the cosmogenic isotope production during the mentioned interval. As it seems that during Maunder Minimum the Be10 production oscillates of about a factor of two, the authors have also to expect short scale enhanced variations in tree rings radiocarbon concentrations for the same interval. It is therefore highly desirable that for the same interval, that the authors would identify with 1640-1720 AD, detailed concentration measurements both of Be10 (in dated polar ice in addition to those of Beer et al.) and of tree ring radiocarbon, be made with cross-checking, in samples of different latitudes, longitudes and within short and large distance of the sea. The samples could be taken, as for example in

samples from the central Mediterranean region, in the Baltic region and in other sites from central Europe and Asia.

43724 (INIS-SU–109/A, pp. 56-58) **Diffusion gamma radiation of the Galaxy in the energy range of $10^{10}<E\leq5x10^{14}$ eV.** Urysov, A.V. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Experimental and theoretical physics.* Order Number DE89012198/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 10.

Spectrum of gamma-quantum birth in π^0-meson decay in the energy range $E>10^{10}$ eV was obatined. Spectra of gamma raiation of galactic disk in directions to the center and anticenter at energies of $10^{10}<E\leq5x10^{14}$ eV were calculated. Correlation with gamma-data, obtained by using devices for investigation of wide atmospher showers was conducted. 11 refs.; 1 tab.

43725 (INS–740) **Double compactification.** Nakamura, A.; Shiraishi, K. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Mar 1989. 27p. Order Number DE89906506/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

A cosmological scenario that our universe experienced space-time compactifications twice in its early development is investigated through toy models. In this scenario gauge configurations on an extra space play essential roles to bring about a change of the dimensionality of the compactified space. Simple models are offered and their behavior at finite temperature is examined. A possibility of causing inflation and problems on our scenario is argued briefly. (author).

43726 (LA-UR–89-2384) **Continuum spectra for gamma-ray bursts: Suppressing the soft photons.** Ho, Cheng; Epstein, R.I. Los Alamos National Lab., NM (USA). 1989. 9p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-8904216–5: Gamma ray observatory science workshop, 10-12 Apr 1989). Order Number DE89015260/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Gamma-ray bursts are observed to have very steep spectra below photon energy ~100 keV; some have photon number spectra as steep as $F \propto E^0$. This property has been difficult to explain in terms of most radiation processes. The BATSE experiment on the Gamma Ray Observatory should be able to test how common this spectral property is and whether there are bursts with even steeper low-energy spectra. To explain this spectral steepness, we study a model in which the γ radiation is produced by inverse-Compton and cyclotron scattering of blackbody radiation from the surface of a neutron star by relativistic electrons. If the neutron star has negligible magnetic field, Compton scattering dominates in producing the observed gamma-ray burst spectra. If the field exceeds 10^{10} G, cyclotron scattering is more important. In the low-magnetic-field case, steep spectra may be produced via the suppression of the low energy part of the "cooling spectrum" (the spectrum integrated over the radiation lifetime of an electron), as a result of the smaller and more collimated photon flux an electron sees as it moves away from the neutron star. In the high-magnetic-field case, low-energy suppression occurs because electrons with higher energies scatter the blackbody photons more efficiently due to the cyclotron resonance, preferentially producing high energy photons. 27 refs., 5 figs.

43727 (LA-UR–89-2422) **The EUV emission of cataclysmic variables.** Raymond, J.C.; Mauche, C.W. Los Alamos National Lab., NM (USA). Jul 1989. 11p. Sponsored by DOE/DP;NASA. DOE Contract W-7405-ENG-36. (CONF-890189–7: Berkeley colloquium on extreme ultraviolet astronomy, 19-20 Jan 1989). Order Number DE89015254/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Approximately half the luminosity of a typical cataclysmic variable may emerge as an optically thick component peaking in the EUV. Observations of this component are important for understanding the energetics and accretion rates of CV's in general, as well as for understanding the physics of the accretion process. The nature of the turbulent boundary layers and winds of disk accretors and the heating of the white dwarfs by accretion are among the problems which can be addressed by observations in the EUV. 46 refs., 2 figs.

43728 (LBL–27392) **The interplay of nuclear and atomic physics in the synthesis of the elements.** Norman, E.B. Lawrence Berkeley Lab., CA (USA). Mar 1989. 15p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890387–7: Workshop on highly charged ions: new physics and advanced techniques, 13-15 Mar 1989). Order Number DE89016305/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In many astronomical environments, physical conditions are so extreme that matter is almost completely ionized. The absence of bound atomic electrons can dramatically alter the decay rates of a number of radioactive nuclei. Several examples of this interplay of nuclear and atomic physics relevant to the synthesis of the chemical elements are described. 16 refs., 4 figs.

43729 (PB–89-170039/XAB) **Black holes in closed universes.** Qadir, A. Quaid-i-Azam Univ., Islamabad (Pakistan). Dept. of Mathematics. Aug 1988. 35p. (QAUM–88/36). Available from NTIS, PC EE03/MF A01.

Black holes are usually defined in the context of asymptotically flat space-times. In order to demonstrate that the black hole and big-crunch singularities are essentially part and parcel of the same singularity, cut-and-paste methods were used to construct models in which the black hole was embedded in a closed cosmology. In this paper the variation of the properties of the model with initial conditions is investigated. The problem, that there is no longer an 'observer at infinity' (as a ready reference to define the black hole), is overcome by using a foliation of constant mean extrinsic curvature to define the 'preferred observer' at every point.

43730 (PB–89-173058/XAB) **Solar-Geophysical Data Number 534, February 1989. Part 2 (comprehensive reports). Data for August 1988 and miscellaneous.** Coffey, H.E. National Geophysical Data Center, Boulder, CO (USA). Feb 1989. 68p. (SGD–534-PT-2). Available from NTIS, PC A04/MF A01.

See also Part 1, PB–89-173041.

Contents include: detailed index for 1988 and 1989; data for August 1988 (solar flares, solar radio bursts at fixed frequencies, solar x-ray radiation from goes satellite, mass ejections from the sun, active prominences and filaments); miscellaneous data (Meudon carte synoptique July 1988).

43731 (PB–89-184949/XAB) **Molecular cloud content of early-type galaxies. 1. Detections and global properties.** Wiklind, T.; Henkel, C. Chalmers Univ. of Tech., Goeteborg (Sweden). Onsala Space Observatory. 1989. 25p. (REPT–89/01). Available from NTIS, PC EE02/MF A01.

The authors have started an observing program to detect and map the molecular gas in elliptical and lenticular galaxies using the CO(1-0) and (2-1) emission lines as tracers of the gas. The galaxies they have observed to date constitute a sample selected through their far-IR properties and the presence of dust only. Remarkably enough, the detection rate has been very high, approaching 100% if one excludes those with upper limits too large to be significant when compared with the levels of the detected ones. The authors present the observations and a discussion of the global properties of the molecular content of early-type galaxies compared with a sample of spiral galaxies compiled from the literature.

43732 **Phenomenology and cosmology with superstring-motivated models.** Shafi, Q. (Bartol Research Foundation, Univ. of Delaware, Newark, DE (US)). vp. of Superstrings, anomalies and unification. Martinis, M.; Andric, I. World Scientific Pub. Co., Teaneck, NJ (1987). (CONF-8606383–: 5. Adriatic meeting on particle physics, Dubrovnik (Yugoslavia), 16-28 Jun 1986).

The authors discuss how realistic low-energy physics can arise from the E_8xE_8 superstring. A key role is played by the discrete symmetries which typically arise after compactification. Cosmological problems are avoided because the discrete symmetry the authors employ is shown to be effectively embedded in a Peccei-Quinn symmetry. The models they present seem to satisfy the known phenomenological and cosmological constraints. In particular, they possess a harmless axion. The existence of topologically stable superconducting vortices (strings), surviving until today, is predicted. Other topics that are discussed include the proton decay, the baryon asymmetry in the Universe and n-n-bar oscillations.

43733 Cosmologically benign gravitinos at the weak scale. Frieman, J.A. (Fermi National Accelerator Lab., Batavia, IL (USA)); Guidice, G.F. *Physics Letters [Section] B (Netherlands)*, 224(1/2): 125-130 (23 Jun 1989).

We show that a gravitino with mass $O(m_W)$ and a high reheat temperature after inflation, $T_R \simeq 10^{12}$-10^{14} GeV, can be compatible with cosmological constraints if the gravitino decays predominantly into neutrino-sneutrino pairs. Models in which the lightest supersymmetric particle is either the sneutrino or the neutralino are described. In this scenario, gravitino decay provides an alternative mechanism for producing supersymmetric dark matter, which may be either hot or cold. (orig.).

43734 Search for the decay $D^0 \rightarrow \bar{K}^0 e^+ e^-$. Adler, J. (University of Washington, Seattle, Washington 98195(US)); Becker, J. J.; Blaylock, G. T.; Bolton, T.; Brient, J. C.; Brown, J. S.; Bunnell, K. O.; Burchell, M.; Burnett, T. H.; Cassell, R. E.; and others. *Physical Review [Section] D: Particles and Fields (USA)*, 40(3): 906-908 (1 Aug 1989). DOE Contract AC02-76ER01195.

A search for the decay of the charmed meson $D^0 \rightarrow \bar{K}^0 e^+ e^-$ is presented, based on data collected at the $\psi(3770)$ resonance with the Mark III detector at the SLAC storage ring SPEAR. No evidence for this process is found, resulting in an upper limit on the decay branching ratio of 1.7×10^{-3} at the 90% confidence level.

This investigation was made on spectrometric auroral data obtained on the dayside and nightside of the auroral oval in Svalbard. Synthetic spectra of O_2^+ 1NG and N_2^+ 1NG bands were calculated. The transition probabilities were obtained by particular solutions of the Schroedinger equation. The synthetic spectra were used to analyze the auroral spectrum from 5200 to 5800 A, deriving the intensities of all the auroral emissions of this spectral region. The same spectral technique was used to analyze solar spectra, deriving ozone column densities and spectral UV irradiances.

Availability: Document partially illegible.

Operation of the RAYTRACE (version 4.3) software for ionospheric ray tracing is explained. First, installation and setup of the program are discussed. Instructions for routine operation are given, followed by several tutorial examples. Some suggestions for regular usage are given. The final section and the appendices contain useful material, including the source code listing. The RAYTRACE computer program has a number of distinctive capabilities. It performs fully three-dimensional HF/VHF ray tracing through a climatological ionosphere. Single or multiple rays may be traced during a single run, allowing the user greater flexibility in modeling. The size of the increments used in the ray path calculation is user adjustable so that appropriate compromises may be made between execution time and accuracy. The program can trace rays between points at different altitudes. Cutoff criteria may be set to stop the calculation at a particular range or altitude. RAYTRACE calculates a number of important quantities about the ray. The change in signal intensity due to distance and ionospheric focusing or defocusing is calculated. The group and phase path length values are both calculated. The location, as well as information on the direction of the ray, are calculated for the end point of the ray and any intervening earth impact points (collectively these are called the data points for the ray).

43737 (AD-A–205599/4/XAB) **Solar flares and magnetospheric particles: investigations based upon the ONR-602 and ONR-604 experiments. Annual letter report for period ending 30 November 1988.** Wefel, J.P. Louisiana State Univ., Baton Rouge, LA (USA). Dept. of Physics and Astronomy. 30 Nov 1988. 49p. Available from NTIS, PC A03/MF A01.

Data from the ONR-602 experiment, obtained in a low-altitude, polar orbit are being analyzed to investigate the composition, intensity levels and time variations of energetic charged particles both trapped within the Earth's magnetosphere and incident upon the magnetosphere from interplanetary space, particularly solar-flare particles. The effort involves both data analysis/interpretation and detailed modeling of the near-Earth environment. The research focusses on the 'global zones' of low-energy particle precipitation, including the South Atlantic Anomaly region from which access to the radiation belts is obtained, and the solar particle events of May-Nov., 1982. In addition, scientific/technical support is being provided to the ONR-604 experiment to be launched on the CRRES mission. The results of these investigations will enhance our understanding of the geospace radiation environment and its effects on men, materials, and electronic systems in space.

43738 (AD-A–205703/2/XAB) **Polar-cap plasma convection measurements and their relevance to the real-time modeling of the high-latitude ionosphere.** Air Force Geophysics Lab., Hanscom AFB, MA (USA). 7 May 1987. 18p. (AFGL-TR–88-0253). Available from NTIS, PC A03/MF A01.

Pub. in The Effect of the Ionosphere on Communication, Navigation, and Surveillance Systems Based on Ionospheric Effects Symposium, 659-673(5-7 May 1987).

Plasma-convection measurements, using Digisonde ionospheric sounders, were conducted. The plasma convection or ionospheric-drift measurements conducted at Thule and Qaanaaq during campaigns from Winter 1983/84 to present provide evidence, that antisunward convection dominates in the polar cap with velocities typical between 300 and 900 m.sec. Drift shears were observed during periods of arc-transition (quiet magnetic conditions). Observations of the plasma drift at Goose Bay show a drift reversal from westward to eastward around midnight CGLT. Observations at Argentia, typically a suboval/trough station, provide evidence under magnetically disturbed conditions for the midnight reversal of the antisunward flow pattern. However, the data are less consistent under magnetically quiet conditions. The proximity of the station to the boundary between corotating and convecting plasma may at times affect the consistency of the measurements. Recent theoretical calculations of electron density profiles within the high-latitude/polar-cap ionosphere demonstrate that the diurnal foF2 variation observed at Thule, is controlled by the plasma-convections pattern and the associated drift velocities. The model calculations for Bz < 0 and Bz. approx. 0 show factor 2 to 3 differences in Nmax over Thule, supporting the stated importance of convection pattern and velocity measurements for the modelling of the high-latitude ionosphere.

43739 (AD-A–205965/7/XAB) **Impact of the geoplasma on a spaceborne GPS (global positioning system) receiver system - a preliminary study. Memorandum report.** Goodman, J.M. Naval Research Lab., Washington, DC (USA). 28 Feb 1989. 151p. (NRL-MR–6290). Available from NTIS, PC A08/MF A01.

It is well known that the most-accurate positioning information obtainable from the GPS system, in the traditional application where the receivers are located on or very near to the surface of the earth, i.e., beneath the ionosphere, is achieved through use of the two-frequency method so that the ionospheric component of the ranging error can be removed. However, in an application where a GPS receiver is itself located on a spacecraft orbiting above some of the electron content in the ionosphere and protonosphere, the question as to whether a two-frequency system is necessary may have a different answer. In this preliminary study, the parameters of the latter question are explained and the range of errors which might be experienced by a single-frequency system are estimated.

43740 (AD-A–205976/4/XAB) **VLF/LF (very low frequency/low frequency) reflection properties of the low-latitude ionosphere. Interim technical report.** Klemetti, W.I.; Kossey, P.A.; Rasmussen, J.E.; Sueli Da Silveira Macedo Moura, M. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 4 Feb 1988. 95p. (AFGL-TR–88-0034). Available from NTIS, PC A05/MF A01.

Low-latitude observations of VLF/LF pulse reflections from the lower ionosphere obtained at nine locations to the east and west of a transmitter in southeastern Brazil are described. The data provide

a variety of information on the reflection properties of the ionosphere below about 90-km altitude. Aspects of the data are presented in quasi-dimensional formats useful for identifying ionosphere structure and variability, and detailed analyses of portions of the data provided, which characterize the effective heights of the reflection coefficients of the ionosphere at noon and midnight, over a frequency range from 15 to 65 kHz. Electron-density models of the ionosphere, derived from VLF/LF reflection data are also discussed.

43741 (AD-A-206062/2/XAB) **Plasma simulation of ion acceleration by lower hybrid waves in the suprauroral region.** Retterer, J.M.; Chang, T.; Jasperse, J.R. Air Force Geophysics Lab., Hanscom AFB, MA (USA). 27 Sep 1988. 5p. (AFGL-TR-88-0250). Available from NTIS, PC A02/MF A01.

Pub. in Ion Acceleration in the Magnetosphere and Ionosphere, 282-285(1986).

The generation of lower hybrid waves below field-aligned potential drops and the effect of the resulting turbulence on the ion population in the suprauroral region are studied using particle plasma simulations. To describe the ion acceleration observed in the simulation, a theoretical model is developed using mode-mode coupling processes to generate the low phase velocity VLF waves with which the ions first interact. By scaling the simulation results, we show that interaction between the ions and the lower hybrid waves can account for the acceleration necessary to produce suprauroral ion conic events.

43742 (AD-A-206227/1/XAB) **X-ray spectrophotometric remote sensing of diffuse auroral ionization. Technical report.** Vondrak, R.R.; Robinson, R.M.; Mizera, P.F.; Gorney, D.J. Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab. 20 Mar 1989. 24p. (TR-0088(3940-06)-3). Available from NTIS, PC A03/MF A01.

Auroral electron precipitation produces both E-region ionization and bremsstrahlung x rays. In a set of coordinated observations these atmospheric effects of electron precipitation were measured simultaneously by the x-ray sensor on the DMSP/F2 spacecraft and by the incoherent-scatter radar at Chatanika, Alaska. In all data sets there was good agreement between the locations of the x-ray source regions and the regions of enhanced E-region ionization. Detailed comparisons were made between the measured and derived altitude profiles of ionization for two auroral conditions, a pre-midnight auroral band and a sunlit diffuse aurora. These comparisons validate the ability to derive auroral ionization from satellite-based x-ray measurements.

43743 (AD-A-206252/9/XAB) **Particle simulations of magnetospheric plasmas. Final report, 1 November 1987-31 October 1988.** Nishikawa, K.I. Iowa Univ., Iowa City, IA (USA). Dept. of Physics and Astronomy. 14 Mar 1989. 11p. Available from NTIS, PC A03/MF A01.

Plasma-physics processes occurring in magnetospheric plasmas are studied by means of numerical simulations. This study has included the excitation of instabilities due to electron currents and/or ion beams due to the presence of nonuniform electric fields. The investigations also included the heating and transport of plasma in the presence of particle interactions with excited waves in a collisionless plasma. Extensive numerical simulations were performed along with the development of analytic theories. These simulations allowed the author to assess the affect of inherent nonlinear processes on plasma dynamics and to compare the simulation results with the observed data.

43744 (AD-A-206459/0/XAB) **Relativistic electron-precipitation patterns in longitude and latitude: a reply to W. R. Sheldon. Technical report.** Baker, D.N.; Blake, J.B.; Gorney, D.J.; Higbie, P.R.; Klebesadel, R.W. Aerospace Corp., El Segundo, CA (USA). Space Sciences Lab. 16 Feb 1989. 11p. (TR-0088(3940-06)-6). Available from NTIS, PC A03/MF A01.

In an earlier paper by the authors, a proposal was made that the precipitation of relativistic electrons from the outer magnetosphere into the Earth's atmosphere could have substantial effects on the chemistry of the middle atmosphere. It has been argued that the earlier estimates of precipitation fluxes may have underestimated the precipitation rates in isolated regions, such as the South Atlantic Anomaly, and overestimated the precipitation in other latitude and longitude sectors. Here, the discuss the factors that influence the longitudinal uniformity of relativistic electron precipitation and the implications of their earlier assumption of uniform precipitation.

43745 (AD-A-206733/8/XAB) **Multi-instrument studies of the auroral ionosphere. Final report, 1 November 1985-31 October 1988.** Foster, J.C. Haystack Observatory, Westford, MA (USA). 24 Mar 1989. 18p. Available from NTIS, PC A03/MF A01.

New data-collection modes and analysis techniques were developed that provide good time and spatial coverage and empirical models of the high latitude ionosphere. (1) The first three-radar azimuth scanning experiment was performed combining observations from Millstone Hill, Sondrestrom, and EISCAT to produce maps of the convection electric field at high latitudes at 30-minute intervals throughout an interval of increasing disturbance. (2) Empirical models of the ionospheric-convection electric field were developed from an extensive radar data base. (3) Quantitative models were developed describing the distribution of the field-aligned currents that link the ionosphere and magnetosphere at high latitudes. (4) A test of the local midnight-sector differences in the ionospheric convection models based on incoherent scatter radar data and those based on satellite observations was completed. (5) A new class of intense radar backscatter from the topside F region was identified as produced by parallel current-induced enhancement of the acoustic line. (6) The general characteristics of coherent radar backscatter from E-region irregularities as observed with the Millstone Hill UHF radar was the subject of an intensive study.

43746 (AD-A-206816/1/XAB) **Ground-based measurements of Joule heating rates.** De La Beaujardiere, O.; Johnson, R.; Wickwar, V.B. SRI International, Menlo Park, CA (USA). 3 Apr 1989. 23p. (SCIENTIFIC-1). Available from NTIS, PC A03/MF A01.

Joule heating in the upper atmosphere is the most-important energy-dissipation process between the magnetosphere and the ionosphere. This paper examines the various terms in the equation that governs Joule heating. (1) The ionospheric electric-field seasonal dependence is examined. It is found that the shape of the ionospheric plasma convection cells, and the latitude of the reversal from sunward to antisunward convection, are seasonally dependent. Statistical averages of the square of the ion velocity show a maximum in fall, and a minimum in summer. (2) Pedersen conductivities at F-region altitudes are examined using Chatanika and Sondrestrom radar data. It is shown that during solar minimum conditions, the F-region contributes less than 20% to the total height integrated Pedersen conductivity sigma p. In contrast, during solar maximum conditions the contribution to sigma from solar produced F-region ionization can be 60%. (3) The importance of the neutral wind term in Joule heating calculations is illustrated using a specific example. The Joule heating calculated by including the neutral wind term is 2 to 4 times smaller than that calculated without the neutral wind. But the reverse can also be true, as shown during a period when the neutral wind played the role of a dynamo in the ionosphere/magnetosphere current.

43747 (AD-A-206819/5/XAB) **Electrodynamics of the high-latitude ionosphere. Technical report.** Heelis, R.A. Texas Univ., Richardson, TX (USA). Center for Space Sciences. Nov 1988. 17p. (SCIENTIFIC-1). Available from NTIS, PC A03/MF A01.

A broad range of scientific investigations ranging from the development of large-scale models of ionospheric convection to small scale plasma flows associated with polar-cap arcs is described. It is shown that during times of northward IMF, coherent mesoscale convection features can frequently be identified at high latitudes. We now have the ability to quite accurately reproduce the convective features of the plasma at high latitudes during periods of southward IMF. Advances in understanding of electric-field coupling in plasma structures and the differences in local and height-integrated Joule heating rates are also described. The importance of the bottomside F-region concentration in determining the effectiveness of electrical coupling is emphasized.

43748 (AD-A-206821/1/XAB) **Model studies of the polar ionosphere. Final report, 28 August 1985-27 November 1988.** Sheehan, R.E. Boston Coll., Chestnut Hill, MA (USA). 21 Nov 1988. 88p. Available from NTIS, PC A05/MF A01.

This report presents modifications and additions to an ionospheric-chemistry computer program that models the high-latitude - polar-cap ionosphere (1-dimensional along a magnetic field line; 100-600 km altitude). Interest centers on effects of soft (1-kev) electron fluxes typically observed precipitating into the polar-cap ionosphere. Major changes involved incorporating an existing Q+ diffusion code with the Strickland local (E region) ionospheric-chemistry code and the addition of electron and ion temperature calculations based on the diffusion code. Also included are calculations of Hall and Pedersen electric conductivities and a separate program that determines electric currents in the ionosphere based on the model result; these were used in conjunction with measurements from the PIIE rocket campaign in Feb 1985. Some details of the numerical methods used in the various calculations are given, as well as an overview of the programming logic and a step-by-step description of program execution. The Strickland flux transport program that calculates production rates input to the chemistry model remains essentially unchanged, but a new parameterization scheme was developed that could have applications to global problems requiring a large number of flux calculations.

43749 (AD-A–206880/7/XAB) **Fully analytic, low- and middle-latitude ionospheric model.** Anderson, D.N.; Forbes, J.M.; Codrescu, M. Boston Univ., MA (USA). 1 Feb 1989. 6p. Available from NTIS, PC A02/MF A01.

Pub. in Jnl. of Geophysical Research, Vol. 94, No. A2, 1520-1524(1 Feb 1989).

A fully analytic ionospheric model emphasizing the low-latitude F region for various seasonal and solar-cycle conditions is presented. Features such as the post-sunset rise in the F-layer peak height and the 'equatorial anomaly' maxima in plasma density near + or - deg geomagnetic latitude are designed to closely approximate those in the semi-empirical low-latitude ionospheric model. Significant improvements are thus obtained over previous comparable analytic models. Numerical computations are also presented that demonstrate the importance of these large-scale plasma structures to the neutral dynamics of the low-latitude thermosphere. Equally significant effects are anticipated for the electrodynamic simulations of E region/F region coupling involving flux-tube integrated electrical conductivities.

43750 (AD-A–206881/5/XAB) **Magnetosphere - thermosphere coupling: an experiment in interactive modeling.** Forbes, J.M.; Harel, M. Boston Univ., MA (USA). 1 Mar 1989. 16p. Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Geophysical Research, Vol. 94, No. A3, 2631-2644(1 Mar 1989).

The Rice convection model (RCM) is utilized to investigate the electrodynamic coupling between the inner magnetosphere and the thermosphere including the effects of EUV- and convection-driven neutral winds under quasi-equilibrium conditions. It is shown that the parameters determining the coupling are the Pedersen and Hall effective winds, which are the height integrals of the respective conductivity-weighted wind profiles divided by the respective layer conductivities. Their appearance in the RCM is equivalent to a two-slab formulation whereby the integrated Hall conductivity originates in the lower slab, the integrated Pedersen conductivity originates in the upper slab, and the height dependence of the neutral wind is accounted for by assuming different wind vectors for the lower and upper slab. A unique aspect of the study is that the convection-driven winds are included self-consistently and interactively; that is, a steady-state wind parameterization is written analytically in terms of the electrostatic potential, which is in turn included in a closed-loop calculation for the electric potential itself. During the early phases of the disturbance when the normal shielding from high latitudes breaks down, the neutral winds do not modify appreciably the disturbance electric fields at middle and low altitudes. As the system approaches a quasi-equilibrium state, the neutral winds play a much more significant role. By comparison with the 'no-wind' simulation, the fields driven by EUV winds counteract the fields of magnetospheric origin and given the appearance of a shielding effect.

43751 (AD-A–207036/5/XAB) **Three-dimensional equilibrium and stability of ionospheric plasma clouds. Memorandum report.** Drake, J.F.; Mulbrandon, M.; Huba, J.D. Naval Research Lab., Washington, DC (USA). 22 Mar 1989. 67p. (NRL-MR–6436). Available from NTIS, PC A04/MF A01.

The equilibrium and stability of three-dimensional ionospheric plasma clouds is investigated. The equilibrium density profile is assumed to be a 3D waterbag with a circular cross section transverse to B, and an ellipsoidal cross section parallel to B. The equilibrium potential consists of two parts: a polarization potential driven by a uniform neutral wind, and an ambipolar potential driven by parallel electron pressure. The latter potential is shown to cause sheared azimuthal plasma flows perpendicular to B. A stability analysis of this equilibrium is carried out. It is found that the E X B instability, which causes the structuring of ionospheric plasma clouds, can be stabilized by the azimuthal flow. A marginal stability criterion is derived. On the basis of this stability criterion, striations of barium clouds in the ionospheric F region should be stable to further bifurcation, as is observed.

43752 (AD-A–207150/4/XAB) **Simultaneous radial and pitch-angle diffusion in the outer electron radiation belt. Report for 20 May 1985-1 January 1988.** Chiu, Y.T.; Nightingale, R.W.; Rinaldi, M.A. Lockheed Missiles and Space Co., Palo Alto, CA (USA). Lockheed Palo Alto Research Lab. 1 Apr 1988. 15p. (LMSC/F–307422). Available from NTIS, PC A03/MF A01.

Pub. in Jnl. of Geophysical Research, Vol. 93, No. A4, 2619-2632(1 Apr 1988).

A solution of the bimodal (radial and pitch angle) diffusion equation for the radiation belts is developed with special regard for the requirements of satellite radiation-belt data analysis. This paper uses this solution to test the bimodal theory of outer electron belt diffusion by confronting it with satellite data. Satellite observations, usually over finite volumes of (L,T) space, are seldom sufficient in space-time duration to cover the relaxation to equilibrium of the entire radiation-belt. Since time scales of continuous data coverage are often comparable to that of radiation-belt disturbances, it is therefore inappropriate to apply impulsive semi-infinite time-response solutions of diffusion theory to interpret data from a finite window of (L,t) space. Observational limitations indicate that appropriate solutions for the interpretation of satellite data are general solutions for a finite-volume boundary value problem in bimodal diffusion. Here, such a solution is tested as the prime candidate for comprehensive radiation belt dynamic modeling by applying the solution and developing a method of analysis to radiation-belt electron data obtained by the SCATHA satellite at moderate geomagnetic activity. The results and the generality of the solution indicate its promise as a new approach to dynamic modeling of the radiation belts.

43753 Expanding plasma structure and its evolution toward long wavelengths. Sgro, A. G. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)); Peter Gary, S.; Lemons, D. S. *Physics of Fluids B: Plasma Physics (USA)*, 1(9): 1890-1899 (Sep 1989).

The expansion of a plasma slab across an initially uniform magnetic field is simulated by the use of a two-dimensional electromagnetic hybrid (particle ions, fluid electrons of nonzero mass) computer code. The expanding plasma develops magnetic-field-aligned structure on time scales faster than an ion gyroperiod. Through the full duration of the m_i/m_e =100 simulation, the structure wavelength is well predicted by the wavelength at maximum growth rate from the linear Vlasov theory of the lower hybrid drift instability modified by deceleration. At m_i/m_e =400, the late time structure wavelength is about 1.5 times the early time value. At m_i/m_e =1836, the structure wavelength at early times is close to that corresponding to the maximum growth rate of linear theory, while at later times the structure wavelength becomes about twice as long as its early time value. These three results suggest that the ratio of the late time wavelength to the early time value gradually increases with m_i/m_e. Extrapolation of this scaling to larger m_i/m_e values is consistent with structure wavelengths observed in an expanding aluminum plasma experiment [J. Appl. Phys. J. **20**, 157 (1981)], as well as the observed wavelength in the expanding barium plasma of the AMPTE magnetotail experiment [J. Geophys. Res. **92**, 5777 (1987)].

43754 Development of flute modes on expanding plasma clouds. Winske, D. (Applied Theoretical Physics Division, Los Alamos National Laboratory, MS-E531, Los Alamos, New Mexico

87545 (US)). *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1900-1910 (Sep 1989).

Structuring that results from plasma streaming at sub-Alfvenic speeds across an external magnetic field is considered. Previously, it has been proposed the lower hybrid drift instability enhanced by the deceleration of the plasma by the field produces the flute modes observed on the surface of expanding laser produced plasmas and the AMPTE magnetotail releases [Eos (Trans) 63, 843 (1982)]. An appropriate dispersion equation to describe the properties of the unstable waves has been derived and particle simulations carried out to show the growth and evolution of the instability. The salient features of this earlier work are reviewed here, and then additions and refinements to the theory and simulations are described. In particular, the scaling of the wave properties with the ratio of the ion gyroradius to the magnetic confinement radius is discussed and the nonlinear evolution of the instability is investigated more thoroughly. The consequences of these results, both for the laser experiments and for AMPTE, are also considered. To this end, a comparison of the linear and nonlinear properties of the waves observed in the simulations with those seen in the experiments is carried out. While there is considerable discrepancy between the observed and predicted wavelengths of the modes, the effects considered here are in the direction of reducing the disagreement.

Pub. in Jnl. de Physique, Supp. 12, Vol. 48, C9-951-C9-954(Dec 1987).

Synchrotron-radiation measurements of near-threshold and broad-range (20 eV-3 keV) absolute photoabsorption cross sections were made at the Brookhaven National Laboratory (NSLS) and at Stanford (SSLR). Transmission data for well-characterized multilayer foils provided absolute corss sections with 10% overall uncertainties and better than 0.2% energy resolution. Several examples of the results are presented.

43756 (AD-A-206444/2/XAB) **Use of Gaussian-type functions in Dirac-Fock basis-set expansion calculations.** Ishikawa, Y.; Sekino, H. Puerto Rico Univ., Rio Piedras (Puerto Rico). 1988. 8p. Available from NTIS, PC A02/MF A01.

Pub. in International Jnl. of Quantum Chemistry: Quantum Chemistry Symposium 22, 457-463(1988).

Dirac-Fock balanced Gaussian-basis calculations that employ an extended-nucleus model were performed on Be and Ne atoms by systematically enlarging the basis set. As expansion size increases, the total energy smoothly converges toward the numerical Dirac-Fock limit from above. The balanced expansion method does not introduce any of the variational instabilities that have plagued the early Dirac-Fock-basis expansion calculations.

43757 (AD-A-206833/6/XAB) **High altitude plume emissions in atmospheric-window region.** Sharma, R.D.; Bakshi, P.; Sindoni, J. Air Force Geophysics Lab., Hanscom AFB, MA (USA). Feb 1989. 19p. (AFGL-TR-89-0082). Available from NTIS, PC A03/MF A01.

Quantum-Mechanical Spectator model (Impulse Approximation) is used to calculate the cross section for rotation-vibration excitation of CO during collision with atomic oxygen at relative velocity (energy) of 5 (1.3), 8 (3.3), 11 (5.3), and 14 km/s (10.2 eV). The calculation is carried out for initial CO vibrational level v=o and rotational levels J=O and J=10 and final vibrational levels v'=o - 6 and final rotational levels up to J'=100. It is shown that the final results are almost independent of the initial rotational level. The rotational distribution in the final vibrational levels is rather flat and cannot be described by a Maxwell-Boltzmann distribution. The final rotation-vibration distributions are translated into relative emission in the 4.7-micron region. The emitted radiation from each level shows an R-branch bandhead around 4.4 microns with P-branch extending beyond 6 microns. It is expected that carbon dioxide and water generated by the plumes at high altitudes, upon collision with atomic oxygen, would also emit band infrared radiation around 6, 4.3, and 2.7 microns.

43758 (AD-A-206936/7/XAB) **Dynamics of excited high-lying states of H_2 and D_2. Final reportM 5 May 1986-4 October 1988.** Kachru, R.; Helm, H. SRI International, Menlo Park, CA (USA). Nov 1988. 76p. (SRI-MP-88-234). Available from NTIS, PC A05/MF A01.

The spectroscopy and dynamics of Rydberg states of molecular hydrogen is important in modeling discharge- and electron-beam-pumped lasers, molecular ion electron collisions, and the photoionization of molecular hydrogen. The primary objective was to investigate the excited states of H_2 and D_2 as two prototypes for a systematic study of manifestations of the static and dynamic interactions governing molecular Rydberg states. The experimental approach employed a stepwise laser-excitation scheme. Detection of the charged molecular, atomic fragments, and the energy-analyzed electrons enabled measurement of autoionization, ionization, dissociation, and the competition between them. The authors studied and analyzed the np autoionizing Rydberg states in H_2. We also studied the competition between photoionization and photodissociation from the $C1\Pi u H_2$ state. In addition, they performed the first study of the onset of field ionization and the forced rotational autoionization of the np Rydberg states. They demonstrated that the ionization process can be described classically.

43759 (AD-A-206987/0/XAB) **Updated excitation and ionization cross sections for electron impact on atomic oxygen. Technical report, 1 October 1987-29 February 1988.** Laher, R.R.; Gilmore, F.R. R and D Associates, Marina del Rey, CA (USA). 29 Feb 1988. 97p. (RDA-TR-135603-009). Available from NTIS, PC A05/MF A01.

Cross sections for the excitation and ionization of atomic oxygen by electron impact are presented as the result of a critical review of experimental and theoretical work on this subject. An effort was made to compile the most accurate and complete set of cross sections available. More than 60 profiles of excitation cross sections versus electron-impact energy are presented. These include transitions to the forbidden metastable O(1D) and O(1S) states, the allowed autoionizing O(2p5 3po) state, nine allowed Rydberg series, and twenty nine forbidden Rydberg series. Recommended ionization cross sections for transitions to the outer electron ionization states O+ (4so), O+(2do), and O+(2po), to the inner electron ionization state O+(4p), and to the O2+ state are also given. Many of these excitation and ionization cross sections are based on recently published laboratory measurements, and differ from previously accepted values by factors of approx. 2-3, and in a few cases by up to a factor of 10.

43760 (AECL-9502) **Program COPSI.** Lee-Whiting, G.E.; Petrovich, G.A. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jun 1987. 31p. Order Number DE89633965/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The program COPSI (Calculation of Product Surface Irradiation) for calculating the distribution of linac-generated electrons over the surface of a product being irradiated is described. The lenses, momentum analyzer and scanner in the system are treated in first-order optics. An idea for a one-dimensional scanner free of edge focusing is discussed. The effects of the initial distributions in phase space and of multiple scattering in the window and in the air between the window and the product are both included approximately.

43761 (CONF-890697-2) **Electron collisions in gas switches.** Christophorou, L.G. Oak Ridge National Lab., TN (USA). 1989. 18p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From NATO Advanced Study Institute on non-equilibrium processes in partially ionized gases; Acquafredda di Maratea (Italy); 4-17 Jun 1989. Order Number DE89015307/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Many technologies rely on the conduction/insulation properties of gaseous matter for their successful operation. Many others (e.g., pulsed power technologies) rely on the rapid change (switching or modulation) of the properties of gaseous matter from an insulator to a conductor and vice versa. Studies of electron collision processes in gases aided the development of pulsed power gas switches, and in this paper we shall briefly illustrate the kind of knowledge on

electron collision processes which is needed to optimize the performance of such switching devices. To this end, we shall refer to three types of gas switches: spark gap closing, self-sustained diffuse discharge closing, and externally-sustained diffuse discharge opening. 24 refs., 15 figs., 2 tabs.

43762 (CONF-890708–1) **Photodetachment collisions.** Pegg, D.J. Oak Ridge National Lab., TN (USA). 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From 16. international conference on the physics of electronic and atomic collisions; New York, NY (USA); 26 Jul - 1 aug 1989. Order Number DE89015908/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A crossed-beams apparatus has been used to measure the cross sections (angular differential and integral) for photodetaching electrons from metastable He^- and stable B^- ions at λ = 696.2 nm. Kinematic effects were exploited, in a novel way, to enhance the precision of the measurements. The partial (angular integral) cross sections for He^- photodetachment are $\sigma(2^3S)$ = 22.9 $\pm$ 1.0 Mb and $\sigma(2^3P)$ = 10.0 $\pm$ 0.6 Mb. The corresponding cross section for B^- is $\sigma(2\ ^2)$ = 16.5 $\pm$ 2.1 Mb. The calculated cross section for the photodetachment of D^- was used to establish an absolute scale for the relative measurements. Radiative attachment cross sections are derived from the photodetachment results using the principle of detailed balance. 16 refs., 9 figs., 2 tabs.

43763 (DOE/ER/10578–T5) **Hyperfine structure and isotope shift measurements of short-lived elements by laser spectroscopy: Final report.** Schuessler, H.A. Texas A and M Univ., College Station, TX (USA). Dept. of Physics. Apr 1989. 14p. Sponsored by U.S. DOE Energy Research. DOE Contract AS05-80ER10578. Order Number DE89016115/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This report discusses the following topics: on-line collinear fast ion beam or atom beam laser spectroscopy on short-lived elements; and stored ion spectroscopy. (LSP)

43764 (DOE/ER/45130–4) **[Non-empirical interatomic potentials for transition metals, alloys, and semiconductors]: Annual progress report, 1988–1989.** Carlsson, A.E. Washington Univ., St. Louis, MO (USA). Dept. of Physics. 1989. 2p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-84ER45130. Order Number DE89016397/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

METALS/interatomic forces; ALLOYS/interatomic forces; SEMICONDUCTOR MATERIALS/interatomic forces; PROGRESS REPORT; METALS; ALLOYS

43765 (DOE/ER/60473–3) **Selective excitation, relaxation and energy channeling in molecular systems: Progress report, July 1, 1988–June 30, 1989.** Rhodes, W.C. Florida State Univ., Tallahassee, FL (USA). Inst. of Molecular Biophysics. 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-86ER60473. Order Number DE89015827/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This research program involves the theory of dynamical properties of complex molecular systems having many kinds of degrees of freedom and heterogeneous molecular structure. A general feature is how the dynamics of one subsystem are modulated by interactions with the remaining subsystems. Such modulation affects the response, relaxation, and the channeling of processes in the system as a whole. Quantum mechanical coherence and correlation among the components of the system underlie most of the effects encountered.

43766 (IAE–4623/12) **Structural peculiarities and molecular properties of charge complexes formed on positive ion injection into dense inert gas media.** Potapov, S.G.; Suchanov, L.P.; Gutsev, G.L. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 21p. (In Russian). Order Number DE89633953/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The formation of charge complexes resulting from penetration of positive ions into the dense inert gas media is modelled on the basis of Hartree-Fock-Roothaan method calculations of the potential energy surface of proton interaction with n inert gas atoms R. It is shown that molecular ions of the type RH^+, R_2H^+ with binding energy $D_E \geq 0{,}3$ eV are formed at $n \leq 2$, and a polarization 'envelope' of atoms R around ion R_2H^+ is formed only at $n \geq 3$. Using the results of Hartree-Fock calculations on vibrational spectra and those of discrete variational X_α-method calculations on the electronic spectra, the capabilities of experimental optical registration of the predicted ion-molecular compounds in dense inert gas media are analyzed. 37 refs.; 3 figs.; 4 tabs.

43767 (INIS-SU–100, pp. 19-23) **Gamma ray internal conversion lines shift resulting from atom ionization after electron capture.** Bulgakov, V.V. (AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij); Kupryashkin, V.T.; Lashko, A.P. and others. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Energy differencies of four couples of transitions in γ- and conversion spectra of ^{152}Eu and ^{184}Re isomers are measured with high precision. γ-spectra are measured using the HGe detectors. The spectra of conversion electrons are measured using the magnetic high-resolution beta-spectrometer of the $\pi\sqrt{2}$ type. The comparison of energy differences of γ-rays of 963 and 970 keV transitions with the energy difference of their K-lines has revealed the effect of K-line internal conversion shift which is 20$\pm$7eV for K963 transition resolving the level from $T_{1/2}$=3x10^{-14}s ^{152}Sm. The comparison of energy differences of 963 and 964 keV transitions has produced the shift value for K963 20$\pm$9eV. The average weighted value of these two independent measurements is 20$\pm$6eV. For conversion transitions resolving more long-lived levels ($T_{1/2} \geq 9x10^{-13}$s) the effect is not found. The lifetime of atoms in the ionized state is estimated. 11 refs.; 2 figs.; 1 tab.

43768 (INIS-SU–100, pp. 82-85) **Influence of the atomic effects on the annihilation process of slow positrons with inner atomic shells.** Batkin, I.S. (Voronezhskij Gosudarstvennyj Univ., Voronezh (USSR)); Demakov, S.L.; Churakova, T.A. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The annihilation of positrons with the energy from 0.3 to 20 keV undergoing the significant effect of screening with K- and L-shell electrons of inert gases is considered. Wave functions of the bound electron and collising positron are found by the numerical solution of the Dirac equation with the Hartree-Fock-Slater potential. The polarizing effect of the positron on the atomic shell is not taken into account. The results of calculations show that the cross section of the annihilation process for slow positrons greatly increase as compared with the calculations for the Coulomb potential especially in the range of small energies. 2 refs.; 1 tab.

43769 (INIS-SU–100, pp. 98-103) **Oscillations of the angular distribution of positronium 3γ-quanta-annihilation in magnetic field.** Andrukhovich, S.K. (AN Belorusskoj SSR, Minsk (Byelorussian SSR). Inst. Fiziki); Baryshevskij, V.G.; Berestov, A.V. and others. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The earlier forecasted theoretically new phenomenon-time beating of the angular distribution of positronium 3γ-decay quanta in the magnetic field are experimentally studied for the first time. The theory of the phenomenon, the experimental device and the selection of optimum observation conditions are briefly described. The results obtained prove the existence of the beating effct, the characteristics

of oscillations observed correspond to the theoretical predictions. 6 refs.; 2 figs.; 1 tab.

43770 (JINR-N-4(30)-88, pp. 87-94) **Emission characteristics of $Y_1Ba_2Cu_3O_{7-\delta}$ cathode.** Korenev, S.A. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

The results are presented of experimental investigation of the electron beam in diode with cathode on the base of $Y_1Ba_2Cu_3O_{7-\delta}$. After corresponding cathode training, the cathode made from $Y_1Ba_2Cu_3O_{7-\delta}$ material may be practicable of stable current electron beam yeild. It is shown experimentally that the voltage of diode of about 100-300 kV there exists an evident possibility of forming the electron beams with the current density of 70 A-380 A/cm^2. The motion velicity of cathode plasma in the direction of anode for this material of a cathode amounts to (1-3)x 10^6 cm/s. 1 refs.; 4 figs.

43771 (KFK–4553) **X-ray emission of pseudo spark chambers.** Rogner, A. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Karlsruhe Univ. (T.H.) (Germany, F.R.). Fakultaet fuer Physik. Apr 1989. 119p. (In German). Order Number DE89796038/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

Three types of X-ray sources can be classified in the high power Pseudo Spark: anode radiation, which is generated by the self-focused electron beam during the predischarge, radiation from the cathode surface, which has its origin in electrons hitting the walls at the beginning of the main discharge, and plasma radiation, which is emitted partially directed by a small plasma area in the hollow cathode region during the main discharge. The maximum quantum energies of anode and cathode wall radiation are corresponding to the discharge voltage, those of the plasma radiation are typically one to two orders of magnitude lower. The measurement of the X-ray emission is supporting the usual distinction of pre- and main discharge in the Pseudo Spark. Additionally can be shown, that the predischarge consists of a modified Townsend discharge with runaway-electrons in the discharge channel and a normal Townsend discharge with drifting electrons in the hollow cathode region. The events in the hollow cathode region are essential for the transition into the main discharge. A first application of the Pseudo Spark as an X-ray source was realised in an experimental upset for X-ray backlightning of ion beam targets. (orig.).

43772 (KFTI–87-60) **On the possibility of atom acceleration by the X radiation flux.** Shchagin, A.V.; Khizhnyak, N.A. AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst. 1987. 6p. (In Russian). Order Number DE89633978/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Mechanism of atom acceleration in x radiation flux at the expense of a pulse transmitted to the atom under a photoeffect from the internal shell is considered. It is ascertained that under the x-ray quantum energy E_γ >or approx.E_K (absorption K-edge energy) the atom is accelerated along radiation propagation trajectory and $E_\gamma \geq E_K$ the atom is accelerated in the opposite direction. A possibility of applying this effect for atom acceleration is considered for the first time. Formulae for acceleration rate are derived. The maximum possible acceleration rate performed for accelerated Ar atoms gives about 100 GeV/m under ~2.7x10^{23} W/cm^2 power flux. Such accelerator efficieny grows with the increase of accelerated atom finite energy $\sim\sqrt{E}$. Under Ar atom acceleration up to 1 GeV the accelerator efficiency is ~10%. Difficulties related to the way of this acceleration technique realization are discussed. A possibility of realizing the described acceleration mechanism under the natural conditions near x-ray astrophysical sources and its effect on the substance distribution in the cosmic space is underlined. Atom selection by mass occuring near such sources (the light atoms are accelerated towards the source and heavy ones-backwards) can be one of the reasons for relative enrichment of cosmic radiation by heavy elements and star enrichment by light elements (star fuel). A possible process of a star formation near the X-ray source is described. 6 refs.

43773 (LA-UR–89-2335) **Vibrational frequency shifts of fluid nitrogen fundamental and hot band transitions as a function of pressure and temperature.** Schmidt, S.C.; Schiferl, D.; Zinn, A.S.; Ragan, D.D.; Moore, D.S. Los Alamos National Lab., NM (USA). 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890798–7: AIRAPT and EHPRG international high pressure science and technology conference, 17-21 Jul 1989). Order Number DE89015268/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Coherent anti-Stokes Raman scattering (CARS) and spontaneous Raman spectroscopy have been used to obtain vibrational spectra of shock-compressed and static high-pressure fluid nitrogen, respectively. Vibrational frequencies were obtained from the CARS data using a semiclassical model for these spectra. Spontaneous Raman vibrational frequencies were determined by fitting data using a Lorentz shape line. A functional form was found for the dependence of the vibrational frequency on pressure and temperature to 40 GPa and 5000 K, respectively. The result is compared to a recent theoretical model. 6 refs., 2 figs., 1 tab.

43774 (LA-UR–89-2473) **Observation of excited H^0 atoms produced by relativistic H^- ions in carbon and formvar foils.** Mohagheghi, A.H.; Bryant, H.C.; Harris, P.G.; Tang, C.Y.; Quick, C.R.; Reeder, R.A.; Cohen, S.; Smith, W.W.; Stewart, J.E. Los Alamos National Lab., NM (USA). 8 Feb 1989. 27p. Sponsored by DOD;DOE/ER. DOE Contract W-7405-ENG-36;AS04-77ER03998. (CONF-890708–2: 16. international conference on the physics of electronic and atomic collisions, New York, NY (USA), 26 Jul - 1 aug 1989). Order Number DE89015301/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have measured the relative yield of several low-lying excited states of neutral hydrogen atoms produced by the passage of 226-MeV and 581-MeV H^- ions through thin carbon foils and a tilted formvar foil. The relative yields of H^-_*(n = 2,3, 4) were measured for 17 different carbon foils ranging in thickness from 662 Å to 5386 Å at 581 MeV. The relative yield of H^0*(n = 2) was also measured for these carbon foils at 226 MeV. These data exhibit a significant deviation from a simple yield curve indicating that a more complex mechanism than has previously been thought is responsible for producing the excited states. The relative yields of H^0*(n = 2,3) were measured for a tilting formvar foil at 226 MeV; unexplained dips appear at incidence angles of $\theta \approx 12°$ and $\theta \approx 15°$ in the yield of n=2 and n=3 states, respectively. 19 refs., 7 figs., 1 tab.

43775 (LBL–26795) **In-situ density and temperature measurements of vibrationally-excited hydrogen molecules in ion source plasmas.** Stutzin, G.C.; Young, A.T.; Doebele, H.F.; Schlachter, A.S.; Leung, K.N.; Kunkel, W.B. Lawrence Berkeley Lab., CA (USA). Jun 1989. 14p. Sponsored by DOD;DOE/ER. DOE Contract AC03-76SF00098. (CONF-890703–15: International conference on ion sources, 9-15 Jul 1989). Order Number DE89016315/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The role of highly vibrationally-excited hydrogen molecules has been postulated to be of great importance in H^- ion sources. However the difficulty of making in-situ measurements has led to a paucity of direct determinations of these species within the plasma of these sources. Recently, vacuum-ultraviolet (VUV) laser absorption spectroscopy has been used to measure the H_2 rovibrational populations up to $v'' = 5$ and $J'' = 8$ in a medium-power hydrogen plasma. This work extends those measurements to $v'' = 8$ and to $J'' = 13$. The populations of the vibrational levels still appear to be almost Boltzmann. The theoretically predicted plateau is not observed up to the detection limit. The dependence of several vibrational levels on discharge current and filling pressure is shown. 15 refs., 4 figs.

43776 (LBL–27468) **Threshold photoelectron spectrum of the Argon 3s satellites.** Medhurst, L.J.; Von Wittenau, A.S.; van Zee, R.D.; Zhang, J.S.; Liu, S.H.; Shirley, D.A.; Lindle, D.W. Lawrence Berkeley Lab., CA (USA). Jul 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89015338/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Lately a variety of techniques have studied the electron correlation satellites with binding energies between the Argon 3s binding energy (29.24 eV) and the $2p^{-2}$ ionization potential (43.38 eV). One of these techniques, Threshold Photoelectron Spectroscopy, with ~90 meV FWHM resolution, revealed at least 25 individual electronic

states. All of these could contribute to any other satellite spectrum, and this helped explain some discrepancies between previous measurements. This technique has been applied to the same region with higher resolution (<60 meV at the Ar $3s^{-1}$peak). In this higher resolution spectrum at least 29 individual electronic states are present. In some cases the multiplet splitting is observed. 12 refs., 2 figs.

43777 (PB–89-186464/XAB) **Absolute cross sections for molecular photoabsorption, partial photoionization, and ionic photofragmentation process.** Gallagher, J.W.; Brion, C.E.; Samson, J.A.R.; Langhoff, P.W. Joint Inst. for Lab. Astrophysics, Boulder, CO (USA). 1988. 145p. Available from NTIS(Order as PB–89-186449).

Included in Jnl. of Physical and Chemical Reference Data, Vol. 17, No. 1, 9-149(1988). Available from American Chemical Society, 1155 16th St., NW, Washington, DC 20036.

A compilation is provided of absolute total photoabsorption and partial-channel photoionization cross sections for the valence shells of selected molecules, including diatomics (H2, N2, O2, CO, NO) and triatomics (CO2, N2O), simple hydrides (H2O, NH3, CH4), hydrogen halides (HF, HCl, HBr, HI), sulfur compounds (H2S, CS2, OCS, SO2, SF6),and chlorine compounds (Cl2, CCl4). The partial-channel cross sections presented refer to production of the individual electronic states of molecular ions and also to production of parent and specific fragment ions, as functions of incident photon energy, typically from approximately 20 to 100 eV. Photoelectron anisotropy factors, which together with electronic partial cross sections provide cross sections differential in photon energy and in ejection angle, are also reported. There is generally good agreement between cross sections measured by the physically distinct optical and dipole electron-impact methods. The cross sections and anisotropy factors also compare favorably with selection ab initio and model potential (X-alpha) calculations which provide a basis for interpretation of the measurements.

43778 (PB–89-186472/XAB) **Energy levels of molybdenum, Mo 1 through 42.** Sugar, J.; Musgrove, A. National Bureau of Standards, Washington, DC (USA). Center for Radiation Research. 1988. 85p. Available from NTIS(Order as PB–89-186449).

Included in Jnl. of Physical and Chemical Reference Data, Vol. 17, No. 1, 155-239(1988). Available from American Chemical Society, 1115 16th St., NW, Washington, DC 20036.

The energy levels of the molybdenum atom, in all stages of ionization for which experimental data are available, were compiled. Ionization energies, either experimental or theoretical, and experimental g-factors are given. Leading components of calculated eigenvectors are listed.

43779 (PNL–6500-Pt.4, pp. 23-25) **Multiple ionization of atoms by ion impact.** DuBois, R.D. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

In order to model the energy deposition of fast ions as they slow down in gaseous media, information about the ionization occurring in collisions between ions and target atoms/molecules is required. Our measurements of doubly differential electron emission cross sections provide detailed information about the ionization process but do not provide any information about the final states of the target. They also do not distinguish between the emission of one or more target electrons in a single collision. It is important to know the relative importance of multiple-, with respect to single-, target ionization in order to accurately model the energy deposition. To date, multiple ionization of He, Ne, Ar, Kr, and Xe targets has been studied. Primarily, H and He ions were used, although some data for heavier ions (C,N and O) have also been obtained.

43780 The vacuum ultraviolet FEL for laser cooling of H atoms. Sander, R.K. (Los Alamos National Lab., Chemical and Laser Sciences Div., MS J567, Los Alamos, NM (US)). vp. of Free-electron laser applications in the ultraviolet. Optical Society of America, Washington, DC (1988). (CONF-880318–: Topical meeting on free-electron laser applications in the ultraviolet, Cloudcroft, NM (USA), 2-5 Mar 1988).

The vacuum-ultraviolet free electron laser (VUV FEL) promises to provide a quantum jump in vacuum-ultraviolet light intensity and spectral brightness. The ideas suggested by the values of these parameters are more akin to the laser experiments of the visible region than traditional VUV photophysics and photochemistry. The first two-photon effect observed in the visible was Raman scattering. Shortly after the invention of the laser, other nonlinear optical effects such as four-wave mixing, third harmonic generation, and two-photon absorption were observed. Only in the last few years have dramatically nonlinear effects, which involve the cooperative absorption of hundreds or thousands of visible photons, been observed.

43781 High-resolution photoemission studies of transuranic actinides with an XUV-FEL. Cox, L.E. (Materials Science and Technology Div., Los Alamos National Lab., Los Alamos, NM (US)). vp. of Free-electron laser applications in the ultraviolet. Optical Society of America, Washington, DC (1988). (CONF-880318–: Topical meeting on free-electron laser applications in the ultraviolet, Cloudcroft, NM (USA), 2-5 Mar 1988).

The evolution of electronic structure across the actinide series is unique in the periodic table. At the beginning of the series of 5f electrons are clearly involved in bonding and are well described by band theory; beyond Pu, however, localization occurs and magnetic and other physical properties indicate a transition to atomic-like behavior has taken place. In the valence-band photoemission spectra this change is manifested by the recession of 5f spectral weight from the Fermi energy and the appearance of multiplet structure. The latter results from the coupling of electron spin and angular momentum in the 5f-ionized final state. The situation is in principle analogous to 4f photoemission in the lanthanides which are well understood, and for which the final-state multiplet intensities can be calculated accurately from atomic theory.

43782 High resolution photoelectron spectroscopy. Arko, A.J. (9512470). vp. of Free-electron laser applications in the ultraviolet. Optical Society of America, Washington, DC (1988). (CONF-880318–: Topical meeting on free-electron laser applications in the ultraviolet, Cloudcroft, NM (USA), 2-5 Mar 1988).

Photoelectron Spectroscopy (PES) covers a very broad range of measurements, disciplines, and interests. As the next generation light source, the FEL will result in improvements over the undulator that are larger than the undulater improvements over bending magnets. The combination of high flux and high inherent resolution will result in several orders of magnitude gain in signal to noise over measurements using synchrotron-based undulators. The latter still require monochromators. Their resolution is invariably strongly energy-dependent so that in the regions of interest for many experiments (h upsilon > 100 eV) they will not have a resolving power much over 1000. In order to study some of the interesting phenomena in actinides (heavy fermions e.g.) one would need resolving powers of 10^4 to 10^5. These values are only reachable with the FEL.

43783 On the relevance of extrinsic defects to melting. Lutsko, J.F. (9502104); Wolf, D.; Phillpot, S.R.; Yip, S. *Scripta Metallurgica (USA),* 23(3): 333-338 (Mar 1989).

Three basic classes of theories of melting have been proposed. The first treats the phenomenon as a homogeneous, bulk process involving a lattice instability, in which the (temperature-dependent) normal modes of the lattice become unstable at sufficiently high temperature. The second involves a mechanical instability occurring when the concentration of intrinsic (i.e., thermally-generated) defects reaches a critical concentration. The third class, originating from experimental observation, describes melting as nucleating at extrinsic defects such as free surfaces, grain boundaries (GBs) etc. Several recent measurements demonstrate that when the surface conditions are modified, the melting point can be depressed or the solid can be substantially superheated. The implication is that melting is basically a heterogeneous process and the mechanism of nucleation at extrinsic defects generally determines the kinetics.

43784 Measurement of the $(1s)(2p_{1/2})$ 2^3P_0-$(1s)(2p_{1/2})$ 2^3P_1 fine-structure splitting in heliumlike Ag^{45+}. Marrus, R. (Physics Department, University of California, Berkeley, California 94720 (US)); Simionovici, A.; Indelicato, P.; Dietrich, D. D.; Charles, P.; Briand, J.; Finlayson, K.; Bosch, F.; Liesen, D.; Parente, F.; and

others. *Physical Review Letters (USA),* 63(5): 502-504 (31 Jul 1989). DOE Contract W-7405-ENG-48.

A new method is described which is capable of determining $|\Delta E_{0-1}|$, the absolute value of the fine-structure splitting of the interval 2^3P_0-2^3P_1 from the hyperfine quenched lifetime of the 2^3P_0 state of heliumlike ions with nuclear spin. Based on this method a measurement is reported of $|\Delta E_{0-1}|$ in the heliumlike ion $^{107}Ag^{45+}$ with the result $|\Delta E_{0-1}|=0.74^{+0.16}_{-0.19}$ eV. The error in the measurement is substantially smaller than the natural linewidth of 1.1 eV.

43785 Wavelengths for n=4–5 transitions in Cu-like Ta, Au, Pb, and Bi. Brown, C. M. (E. O. Hulburt Center for Space Research, Naval Research Laboratory, Washington, D.C. 20375-5000 (US)); Seely, J. F.; Feldman, U.; Cobble, J. A.; Goldstone, P. D. *Journal of the Optical Society of America B: Optical Physics (USA),* 6(8): 1433-1436 (Aug 1989). DOE Contract AC08-80DP40124.

Transitions of the type n=4–5 in Ta^{44+}, Au^{50+}, Pb^{53+}, and Bi^{54+} were observed in the spectra from laser-produced plasmas that were recorded by a grazing-incidence spectrograph. Wavelengths in the range 9–19 A were measured with an uncertainty of ±0.015 A and were compared with previously measured and predicted wavelengths.

43786 The Ba $5d_{5/2}nd_j$, J=4 states and their interaction with the $5d_{3/2}\epsilon d_{5/2}$ J=4 continuum. Dai, C. J. (Department of Physics, University of Virginia, Charlottesville, Virginia 22901 (US)); Jaffe, S. M.; Gallagher, T. F. *Journal of the Optical Society of America B: Optical Physics (USA),* 6(8): 1486-1491 (Aug 1989).

We report measurements of the Ba $5d_{5/2}nd$ J=4 states with emphasis on the two series above the $5d_{3/2}$ limit. These two series appear as a regular series of doublets exhibiting asymmetric profiles of finite width. We have fitted the observed spectra above the $5d_{3/2}$ limit using the quantum defect parameters obtained from the interseries interaction below the $5d_{3/2}$ limit using the Lee and Lu form of quantum defect theory and an adaptation of the Cooke and Cromer method. Both methods give identical fits to the data, and they predict differences in other observable parameters.

43787 Chlorinelike spectra of copper to molybdenum. Kaufman, V. (Atomic and Plasma Radiation Division, National Institute of Standards and Technology, Gaithersburg, Maryland 20899 (US)); Sugar, J.; Rowan, W. L. *Journal of the Optical Society of America B: Optical Physics (USA),* 6(8): 1444-1446 (Aug 1989).

Spectra of Cu to Mo (except for Rb and Sr) were generated in tokamak and laser-produced plasmas and observed photographically. Six lines have been identified in each of the spectra as Cl-like $3s^23p^5$–$3s^23p^43d$ transitions. Wavelengths in the range of 75–150 A, measured with an uncertainty of ±0.005 A, are given. Line classifications were made by comparing the observed wavelengths and relative intensities with those calculated using the relativistic average-of-configuration Hartree–Fock code of Cowan. Predicted values for the corresponding wavelengths of Cl-like Rb and Sr were obtained from these comparisons, with an uncertainty of ±0.010 A.

43788 Low-energy electron capture by N^{3+}, N^{4+}, and N^{5+} from hydrogen atoms using merged beams. Huq, M. S. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831-6372 (US)); Havener, C. C.; Phaneuf, R. A. *Physical Review [Section] A: General Physics (USA),* 40(4): 1811-1816 (15 Aug 1989). DOE Contract AC05-84OR21400.

Measurements of absolute total cross sections for single-electron capture in collisions of N^{3+}, N^{4+}, and N^{5+} ions with ground-state atomic hydrogen are reported in the energy region 0.9–1400 eV/amu. Good agreement is obtained with available theoretical calculations and with previous experimental results at the higher energies. None of the systems studied shows a clear signature of the induced-dipole attractive force in enhancing the cross section.

43789 Close-coupling cross sections for electron-impact excitation of Kr^{26+}. Reed, K. J. (High Temperature Physics Division, Lawrence Livermore National Laboratory, Livermore, California 94550 (US)); Henry, R. J. W. *Physical Review [Section] A: General Physics (USA),* 40(4): 1823-1827 (15 Aug 1989). DOE Contract W-7405-ENG-48.

Coupling effects among the channels for collisional excitation of $2s^22p^4$, $2s2p^5$, and $2p^6$ configurations of oxygenlike krypton have been reinvestigated and found to be small. In an earlier publication, it was reported that coupling to the $2s2p^5$ $^3P^o$ state has a strong influence on the cross section $\sigma(2s^22p^4P \rightarrow 2p^6\ ^1S)$. That apparent coupling is shown to be due to an inconsistency involving orthogonality and correlation functions. We solve the correct set of coupled integrodifferential equations using the niem, Σ, and rmatrix codes. All three calculations are performed using the same atomic states and the same configurations to describe the target. We find very good agreement among the cross sections obtained from all three codes. We also calculated distorted-wave cross sections for the same set of transitions. The distorted-wave results are nearly identical to the results obtained with the close-coupling codes.

43790 Hyperfine structure of some excited states of $^{133}Cs^+$ by collinear laser-ion beam spectroscopy. Sen, A. (Physics Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Childs, W. J. *Physical Review [Section] A: General Physics (USA),* 40(4): 2159-2162 (15 Aug 1989). DOE Contract W-31-109-ENG-38.

Hyperfine structure of a few excited states of $^{133}Cs^+$ in the $5p^55d$ and $5p^56p$ configurations has been measured by laser-induced fluorescence with a collinear laser and slow-ion-beam (~1.5 keV) apparatus. The hyperfine spectrum for the optical transition at 612.86 nm has been recorded for the first time. The full width at half maximum of the laser-induced fluorescence spectra recorded with our apparatus is typically 45–75 MHz. The magnetic dipole (A) and electric quadrupole (B) hyperfine constants have been determined for the two lower levels $5p^55d$ $^3P_2$, $^3F_4$ and the two upper levels $5p^56p$ $(3/2[3/2]_d,\ 3)/2\ [5/2]_3$ at energies 112 803.99, 112 245.44, 129 998.63, and 129 116.56 cm^{-1}, respectively, above the ground state, $5p^6\ ^1S_0$.

43791 A simple model for correcting the zero point energy problem in classical trajectory simulations of polyatomic molecules. Miller, W. H. (Department of Chemistry, University of California and Materials and Chemistry Sciences Division, Lawrence Berkeley Laboratory, Berkeley, California 94720 (US)); Hase, W. L.; Darling, C. L. *Journal of Chemical Physics (USA),* 91(5): 2863-2868 (1 Sep 1989). DOE Contract AC03-76SF00098.

A simple model is proposed for correcting problems with zero point energy in classical trajectory simulations of dynamical processes in polyatomic molecules. The "problems" referred to are that classical mechanics allows the vibrational energy in a mode to decrease below its quantum zero point value, and since the total energy is conserved classically this can allow too much energy to pool in other modes. The proposed model introduces hard sphere-like terms in action–angle variables that prevent the vibrational energy in any mode from falling below its zero point value. The algorithm which results is quite simple in terms of the cartesian normal modes of the system: if the energy in a mode k, say, decreases below its zero point value at time t, then at this time the momentum P_k for that mode has its sign changed, and the trajectory continues. This is essentially a time reversal for mode k (only!), and it conserves the total energy of the system. One can think of the model as supplying impulsive "quantum kicks" to a mode whose energy attempts to fall below its zero point value, a kind of "Planck demon" analogous to a Brownian-like random force. The model is illustrated by application to a model of CH overtone relaxation.

43792 (AD-A–205644/8/XAB) **MPD (Magnetoplasma Dynamic) thruster erosion research. Final report, 1 January-31 December 1987.** King, D.Q.; Callas, J.L. Jet Propulsion Lab., Pasadena, CA (USA). 30 Nov 1988. 34p. (JPL-D–6020). Available from NTIS, PC A03/MF A01.

The multimegawatt MPD (Magnetoplasma Dynamic) thruster is an electric engine capable of orbital transfer and maneuvering of large payloads driven by a megawatt-class space power supply. The MPD thruster is capable of specific impulses from 1,500 to 8,000 s. The high specific impulse means this system can perform missions using much less propellant than chemical systems. A five-MW MPD

electric system, propellant and payload from one shuttle launch must be replaced by the equivalent of four fully loaded Centaur G' stages. Thus, the savings in propellant and launch costs are very substantial. This report discusses 3 aspects of MPD thruster physics: (1) A significant operational problem which has limited the useful operation of the device is discussed. This is severe erosion of the insulator at the cathode insulator junction. A technique that appears to solve the problem has been tested, and is described. (2) A preliminary analyses of anode sheath is presented. (3) Analysis of the discharges two-dimensional nature is explored for the case where transverse gradients are considered but transverse velocity is assumed to be zero. This situation applies to high aspect ratio devices. The analyses concludes with: (a) a formalism that provides a means to qualitatively evaluate Ohmic dissipation from simple measurements of the magnetic Hall effect on magnetosonic choking (where thermodynamics is ignored).

43793 (AD-A-205716/4/XAB) **Population inversions in ablation plasmas generated by intense electron beams. Final report, 1 November 1985-31 October 1988.** Gilgenbach, R.M.; Kammash, T.; Brake, M.L. Michigan Univ., Ann Arbor, MI (USA). Dept. of Nuclear Engineering. Nov 1988. 130p. Available from NTIS, PC A07/MF A01.

Experiments during the past three years have concerned the generation and spectroscopic study of electron beam-driven carbon plasmas in order to explore the production of optical and ultraviolet radiation from nonequilibrium populations. The output of MELBA (Michigan Electron Long Beam Accelerator), has been connected to an electron-beam diode consisting of an aluminum (or brass) cathode stalk and a carbon anode. Magnetic-field coils were designed, procured, and utilized to focus the electron beam. A side viewing port permitted spectroscopic diagnostics to view across the surface of the anode. Spectroscopic diagnosis was performed using a 1-m spectrograph capable of operation from the vacuum-ultraviolet through the visible. This spectrograph is coupled to a 1024-channel optical multichannel analyzer. Spectra taken during the initial 400-ns period of the e-beam pulse showed a low effective-charge plasma with primarily molecular components (C_2, CH) as well as atomic hydrogen and singly ionized carbon (CII). When the generator pulse was crowbarred after the first 400 ns, the spectra revealed a continuation of the low-charge-state plasma. At times greater than 400 ns in non-crowbarred shots, the spectra revealed a highly ionized plasma with a very large intensity line at 2530 Angstroms due to CIV (5g-4f), and lower-intensity lines due to CIII and CII. This CIV line emission increased with time, peaking sharply between 750 and 900 ns, and decayed rapidly in less than 100 ns. Emission from these high ionization states may be due to electron beam-plasma instabilities, as this emission was accompanied by high levels of radio frequency and microwave emission.

43794 (AD-A-206678/5/XAB) **Diagnostics development for e-beam excited air channels. Technical report No. 4.** Stalder, K.R.; Williams, M.S.; Eckstrom, D.J. SRI International, Menlo Park, CA (USA). Feb 1989. 65p. (SRI-MP-88-292). Available from NTIS, PC A04/MF A01.

The conductivity of reduced density channels made by laser-initiated and exploding-wire-initiated discharges was measured systematically by microwave interferometry. The results show that the DC conductivity can be as high as 5×10^{10} for the laser channels and as high as 10^{11} for the exploding-wire channels. The channel temperature inferred from the conductivity levels is as high as 4000 K. The channels cool by adiabatic expansion, and subsequent turbulent convective mixing of the hot central plasma with the cold surrounding air; as a result, the conductivity drops to 5 x 10 to the 9th/s in 2-6 ms, depending on the initial discharge energy. The effects of impurities are discussed, as are the implications for charged particle beam propagation in such channels.

43795 (AD-A-207027/4/XAB) **Problems in dynamic phase transition. Final report, 1 September 1987-30 September 1988.** Hattori, H. West Virginia Univ., Morgantown, WV (USA). Dept. of Mathematics. 18 Nov 1988. 6p. Available from NTIS, PC A02/MF A01.

This paper, on the existence of intermediate magnetohydrodynamic shock waves, has used the technique called the connection matrix to establish one of the intermediate shocks that has not been shown to exist. There are a few approaches to the phase transition problem. One is to consider the momentum equation and another one is to consider the energy equation.

43796 (AD-A-207054/8/XAB) **Spectroscopic diagnostics of electron temperature and energy-conversion efficiency of laser-sustained plasma in flowing argon. Report for 1 September 1987-8 August 1988.** Mazumder, J.; Krier, H.; Chen, X. Illinois Univ., Urbana, IL (USA). Dept. of Mechanical and Industrial Engineering. 25 Aug 1988. 91p. (UILU-ENG-88-4014). Available from NTIS, PC A05/MF A01.

Laser-sustained plasmas are often formed during laser materials interaction. The University's 10-kW CW CO_2 laser was used to study argon plasmas for the application to laser supported propulsion and laser-materials processing. The spectroscopic diagnostic method was applied to study laser-sustained plasmas in 1 atmosphere pure argon gas flow with an f/7 on-axis laser-focusing scheme. High-flow speeds of 2 to 10 m/sec are achieved. Plasma electron-temperature distributions are determined from the 415.8-nm Ar I line and its adjacent continuum intensities. Plasma core temperatures as high as 20,000 K are reported. The total absorption of the incident laser power and the radiation loss by the plasma are calculated from the temperature distribution. Results indicated that up to 86% of the incident laser power can be absorbed and nearly 60% of the incident laser power can be retained by the flowing argon gas to provide thrust. Further research is called for in the laser induced fluorescence (LIF) technique for diagnostics of the downstream mixing zone and the plasma outer region. Experiments over a wider range of operating conditions, as well as multiple plasma testings, are required to find the optimum operating scheme.

43797 (ENEA-RT-FUS-88-05) **Collisional method to correct mesh distortion in two-dimensional Lagrangian hydrocodes.** Caruso, A.; Pais, V.A. ENEA, Frascati (Italy). Centro Ricerche Energia. Sep 1988. 17p. Order Number DE89761845/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Submitted to Il Nuovo Cimento.

Lagrangian numerical codes are widely used to simulate the evolution of fluids in very different regimes and conditions. Inertial confinement fusion applications deserve a special mention. The CCMM, a method to correct the distortion of cells used to zone fluids in two-dimensional Lagrangian hydrodynamic codes, is presented. Two representative cases are used to illustrate the operation of our code DUED, with and without this method. Even if the CCMM is CPU time consuming, it appears very useful to avoid convergency problems and/or error stopping simulations. By keeping the mesh ordering, the CCMM permits the continued simulation of the fluid hydrodynamics even in the presence of highly sheared motions where otherwise the run would stop.

43798 (LA-UR-89-2485) **The soft-sphere model for metals near the critical point.** Shaner, J.W. Los Alamos National Lab., NM (USA). [1989]. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890798-4: AIRAPT and EHPRG international high pressure science and technology conference, Paderborn (Germany, F.R.), 17-21 Jul 1989). Order Number DE89015298/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The soft-sphere model is convenient and accurate for predicting fluid phase thermodynamics. The validity of the model for describing the equation-of-state derivatives, Grueneisen's gamma and sound velocity, is shown. 7 refs., 2 figs.

Thesis. Submitted to San Francisco State Univ., CA.

This thesis describes work done to develop techniques for the graphical presentation of time-dependent 2- or 3-dimensional flow fields generated by fluid modelling together with a distributed computing software architecture to produce the graphics. The software runs on UNIX systems and uses interprocess communication with a TCP/IP based network protocol to implement the architecture. The

system components provide for communication between a video workstation consisting of a microcomputer controller, a frame buffer, a video recording device, and a front end system. The use of particle advection to graphically display the flow fields proper was investigated. The associated numerical calculations for transforming the data into graphical form are described, as are the relative merits and problems involved with this type of graphical display. The representation of the object(s) perturbing of constraining the flow is an important topic in itself, and issues involved in the implementation of features of the software which affect both the display of the object(s) and the flow field are discussed. An analysis is given of the use of video recording and playback as the final manner of presentation for a given data set. 48 refs., 42 figs., 4 tabs.

43800 Confined states in phase dynamics. Brand, H. R. (Fachbereich 7, Physik, Universitat Essen, D-4300 Essen 1, West Germany (US)); Deissler, R. J. *Physical Review Letters (USA),* 63(5): 508-511 (31 Jul 1989).

We discuss the possibility of the coexistence of two states with different wavelengths in the framework of phase dynamics. We investigate in detail this phenomenon which is intrinsically nonlinear and we give a Lyapunov functional for the case of a phase associated with a stationary pattern. The relationship of the confined states discussed here with recent experimental observations of localized states posessing a wavelength different from that in the bulk of the container for the case of slot convection and for the Taylor instability between co-rotating cylinders is critically examined.

43801 Collisional transport treatment of surface plasma structures. Montierth, L. M. (Los Alamos National Laboratory, X-1, E531, Los Alamos, New Mexico 87545 (US)); Morse, R. L.; Neuman, W. A. *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1911-1925 (Sep 1989).

Calculations are shown of the structure of plasmas in equilibrium with solid surfaces that reemit incident plasma ions as relatively cold neutral gas. A numerical transport model that includes a Fokker–Planck treatment of ion–ion collisions obtains the distribution function for ions in a phase space of one spatial coordinate and two velocities. This is done self-consistently with an electrostatic potential, a Maxwell–Boltzmann description of electrons, and electron impact ionization of the reemited neutrals. Solutions are obtained from a higher temperature kinetic regime where Coulomb collisions are nearly negligible to a lower temperature regime where plasma behavior is approximately fluidlike. A result of these calculations is the resolution of an ambiguity posed by previous kinetic regime calculations that omitted ion–ion collisions and obtained a family of solutions for each set of physical parameters [Phys. Rev. Lett. **49**, 650 (1982); Phys. Fluids B **1**, 448 (1989)]. The physically correct solution for semi-infinite surface plasmas is shown to be the member of each family that maximizes the ion thermal conduction to the surface and the magnitude of a maximum in the electrostatic potential that is found in these and the previous calculations. Further results are in agreement at lower temperatures with solutions obtained from a fluid model and the identification of the correct boundary condition on normal flow velocity to be used in fluid models.

43802 Quantitative comparison of molecular dynamics with hydrodynamics in Rayleigh-Benard convection. Puhl, A. (Universite Libre de Bruxelles, Faculte des Sciences, Code Postal 231, Boulevard du Triomphe, B-1050 Brussels, Belgium (BE)); Mansour, M. M.; Mareschal, M. *Physical Review [Section] A: General Physics (USA),* 40(4): 1999-2012 (15 Aug 1989).

Two-dimensional convection in a compressible hard-disk fluid confined between free boundaries is studied from both a microscopic and a macroscopic level, i.e., by molecular-dynamics (MD) simulation on the one hand and by (analytical and numerical) solution of the hydrodynamic equations on the other hand. For a fluid of 5000 hard disks in a rectangular box of an aspect ratio of 2, both approaches are in remarkable quantitative agreement, showing a stable double-roll convection pattern in the final state. From the hydrodynamical point of view the system is just beyond instability (R=1.07R_c) and involves the nonlinear coupling of two modes (codimension-2 bifurcation). The simplest and optimal system to study with MD has an aspect ratio of 1 and involves 1500 particles only. Here, a stable single-roll pattern is observed. The hydrodynamic analysis, though, displays less good quantitative agreement with MD, which is due to the stronger influence of microscopic boundary effects.

We have studied the production of the J/ψ and associated particles using the E672/E706 spectrometer at Fermilab. Preliminary results are presented from the first run in 1987–1988 with 530 GeV/c p/π^+ and π^- beams on a variety of nuclear targets. The A-dependance of J/ψ production with π^- beam was found to agree with an A^α parametrization with $\alpha = 0.85 \pm 0.06$ for $X_F > 0.1$. We have found that (41 $\pm$ 22)% of the J/ψ's produced in the p/π^+ beam are consistent with the radiative decay $\chi \rightarrow J/\psi+\gamma$. The future analysis goals of the experiment are also discussed. 10 refs., 9 figs.

DOE Contract AC03-76SF00098. Order Number DE89016310/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

We present a new measurement of the cross section for the process $e^+e^- \rightarrow e^+e^-\pi^+\pi^-$ at center-of-mass energy 29 GeV for invariant pion pair masses $M_{\phi\phi}$ between 350 MeV/c^2 and 3.5 GeV/c^2. For $M_{\pi\pi}$ above 2.1 GeV/c^2, we find approximate agreement with the hard-scattering prediction of Brodsky and Lepage. In the low mass region, we observe the $f_2(1270)$, and measure its radiative width to be 3.15 ± .04 ± .39 keV. We also observe an enhancement in the $\pi^+\pi^-$ spectrum near 1 GeV. We hypothesize that it is the $f_0(975)$ and determine it's radiative width to be 0.29 ± .07 ± .12 keV. 48 refs.

43809 (LBL–27340) **Measurement of the η parameter in μ^+ decay.** Bossingham, R.R. Lawrence Berkeley Lab., CA (USA). Apr 1989. 156p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89016118/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

This paper discusses the following topics on the muon plus decay; muon decay spectrum; previous determinations of η; experimental apparatus; distortions of the spectrum; and data analysis and results. 31 figs. (LSP)

43810 (LPNHEP–88-07) **Photon structure function study F_2^γ (x,Q^2) with CELLO detector.** Poggioli, L. Paris-11 Univ., 91 - Orsay (France). Jun 1988. 156p. (In French). Order Number DE89908090/JAW. Available from NTIS (US Sales Only), PC A08/MF A01.

This thesis is devoted to the experimental study of the photon structure function using the CELLO detector, settled down on the electron-positron storage ring PETRA at DESY (Germany). After a brief recall concerning the two components of the photon, i.e. the hadronic and point-like part, we review the different theoretical predictions, obtained in the QCD frame. We then introduce an alternative approach, based upon the use of a phenomenological cut in transfer to separate the hadronic and point-like components. We then emphasize the consequences of such an approach. The experimental study has been done first by looking at leptonic final state events, in order to measure the leptonic structure function, and to obtain a proper normalization. The hadronic final state events have been unfolded,, in order to express the results in terms of x true. A comparison to the different theoretical predictions is then performed, allowing to measure the parameters entering these predictions. As a conclusion, we stress the need for clearing out the situation on a theoretical point of view, and the difficulty to measure accurately the photon structure function, due to the limited acceptance of the detector.

43811 (PCCF-T–8806) **π^0 -> γ e^+e^- disintegration study. Electromagnetic form factor study of pion neutral.** Bensayah, M.N. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1988. 101p. (In French). Order Number DE89908092/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

The experimental study of the Dalitz decay π^0 -> γe^+e^- allows the measurement of the π^0 electromagnetic form factor :F(X). ("X"is the (e^+e^-) invariant mass squared normalised by the π^0 mass squared). In most of the theoretical models (V.D.M., quarks triangle,...) F(X) is parametrized in the linear form: 1 + ax. "a" is called the slope of the π^0 electromagnetic form factor. To measure F(X), we have performed an experiment at the Saclay Linear Accelerator where a π^- beam was stopped in a hydrogen liquid target. The π^0 were produced by means of the charge exchange reaction π^-p -> $n\pi^0$. After having presented the theoretical models and the principles of the different methods allowing the measurement, we describe the experimental set up which essentially consists of a two-arms magnetic spectrometer determining the (e^+e^-) pair characteristics. Every (e^+e^-) pair coming from other reactions, than the Dalitz decay are regarded as background. The involved reactions are the inverse electroproduction π^-p -> ne^+e^- and the charge exchange π^-p -> $n\pi^0$ followed by the π^0 decays: π^0 -> $\gamma\gamma$, π^0 -> γe^+e^-, π^0 -> $e^+e^-e^+e^-$. In the two first modes of the π^0 decay, the Compton and the pair production effects may create parasite electrons. Finally, we study the different possible fits of the parameter "a" in our case and the quality of the simulation. We thus conclude that, at the present time, the simulation is not reliable enough to determine "a" and we discuss the improvements needed to allow its measurement.

43812 **BNL glueball review.** Toki, W. H. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309(US)). *AIP (American Institute of Physics) Conference Proceedings (USA)*, 185(1): 692-702 (25 Apr 1989). DOE Contract AC03-76SF00515;AC02-76ER01195;AC03-81ER40050;AM03-(CONF-880862–: BNL workshop on glueballs, hybrids and exotic hadrons, Upton, NY (USA), 29 Aug - 1 sep 1988).

The glueball session of the BNL workshop on glueballs, hybrids and exotic hadrons is reviewed. This include studies of $K\bar{K}\pi$, $\eta\pi\pi$, $\gamma\rho^0$,$\pi\pi$, $K\bar{K}$, $\eta\eta$, $\phi\phi$, $\rho\rho$, $\omega\omega$, and K^*K^* resonances produced in $\gamma\gamma$, J/ψ, K^-p and π^-p reactions.

43813 **Search for a neutral Higgs boson in *B*-meson decay.** Alam, M. S. (State University of New York at Albany, Albany, New York 12222 (US)); Katayama, N.; Kim, I. J.; Li, W. C.; Lou, X. C.; Sun, C. R.; Bortoletto, D.; Goldberg, M.; Horwitz, N.; Mestayer, M. D.; and others. *Physical Review [Section] D: Particles and Fields (USA)*, 40(3): 712-720 (1 Aug 1989).

Using the CLEO detector at the Cornell Electron Storage Ring we have searched for neutral-Higgs-boson production in *B* decay, both through the exclusive modes $B \rightarrow H^0K$ and $B \rightarrow H^0K^*$ using the decay of the H^0 into a pair of muons, pions, or kaons, and through the inclusive decay $B \rightarrow H^0X$ using only the muon decay of the H^0. We find no evidence for a Higgs boson with a mass between $2m_\mu$ and $2m_\tau$.

43814 **Searches for nonminimal Higgs bosons from a virtual *Z* decaying into a muon pair at the SLAC e^+e^- storage ring PEP.** Komamiya, S., et al. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309 (US)). *Physical Review [Section] D: Particles and Fields (USA)*, 40(3): 721-728 (1 Aug 1989). DOE Contract AC03-81ER40050.

Nonminimal neutral Higgs bosons decaying into a muon pair were searched for using the Mark II detector at the SLAC e^+e^- collider PEP at $\sqrt{s}$ =29 GeV. A neutral scalar Higgs boson H_s^0 can be produced accompanied by a pseudoscalar neutral Higgs boson H_p^0 via a virtual Z^0. If the mass of one of the Higgs bosons is between the muon pair threshold and the kaon pair threshold, it may decay predominantly into a muon pair. We looked for muon pair+jet(s) $[e^+e^- \rightarrow H_s^0H_p^0 \rightarrow \mu^+\mu^- + q\bar{q}(\tau^+\tau^-)]$ and three-muon-pair $[e^+e^- \rightarrow H_s^0H_p^0 \rightarrow 3(H_p^0) \rightarrow 3(\mu^+\mu^-)]$ topologies. We found no evidence for these signals above the known background level, and we obtained limits on $\Gamma(Z^0 \rightarrow H_s^0H_p^0)$ as a function of the Higgs-boson masses.

43815 **Study of vector-meson production in e^+e^- annihilation at $\sqrt{s}$ =29 GeV.** Abachi, S. (Argonne National Laboratory, Argonne, Illinois 60439 (US)); Derrick, M.; Kooijman, P.; Musgrave, B.; Price, L. E.; Repond, J.; Sugano, K.; Waschbusch, P.; Blockus, D.; Brabson, B.; and others. *Physical Review [Section] D: Particles and Fields (USA)*, 40(3): 706-711 (1 Aug 1989). DOE Contract W-31-109-ENG-38.

This paper reports cross-section measurements for the ρ^0 and $K^*(890)$ vector mesons produced in e^+e^- annihilation at $\sqrt{s}$ =29 GeV. The data, which were taken with the High Resolution Spectrometer operating at the SLAC colliding-beam facility PEP,correspond to an integrated luminosity of 291 pb^{-1}. The measured multiplicities for fractional momentum x>0.05 are

N_{ρ^0}=0.79±0.04 and $N_{K^{*0}(890)}$=0.53±0.04. The measured fragmentation functions agree well with the predictions of the Lund model and when extrapolated to threshold, the corresponding total multiplicities are N_{ρ^0}=0.90±0.05 and $N_{K^{*0}(890)}$=0.59±0.05.

43816 $W^{\pm}H^{\mp}$ production at hadron colliders. Dicus, D. A. (Center for Particle Theory, University of Texas, Austin, Texas 78712 (US)); Hewett, J. L.; Kao, C.; Rizzo, T. G. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 787-792 (1 Aug 1989). DOE Contract FG05-85ER40200.

We have examined the production of a charged Higgs boson in association with a *W* boson at high-energy hadron colliders, i.e., $pp \rightarrow W^{\pm}H^{\mp}+X$, and find that the production rates can be large. The various subprocesses which contribute to this mechanism at the tree and one-loop levels are compared and we find that quark annihilation $b\bar{b}, t\bar{t} \rightarrow W^{\pm}H^{\mp}$ is dominant. Production via gluon-gluon fusion, which proceeds through box and triangle diagrams, is also found to yield a significant contribution. We also compare our results with those obtained in rank-5 E_6 models for this process.

43817 Production cross section and topological decay branching fractions of the τ lepton. Abachi, S. (Argonne National Laboratory, Argonne, Illinois 60439 (US)); Derrick, M.; Kooijman, P.; Musgrave, B.; Price, L. E.; Repond, J.; Sugano, K.; Blockus, D.; Brabson, B.; Brom, J.; and others. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 902-905 (1 Aug 1989). DOE Contract W-31-109-ENG-38.

We report new measurements of the production cross section for the reaction $e^+e^- \rightarrow \tau^+\tau^-$ at $\sqrt{s}$ =29 GeV, as well as the topological decay branching fractions of the τ lepton. The data were taken with the High Resolution Spectrometer at the SLAC e^+e^- colliding-beam facility PEP. The measured cross section yields $R_{\tau\tau}$=1.044±0.014±0.030 [where the first (second) error is statistical (systematic)], consistent with QED and corresponding to QED cutoff parameters of Λ_+>129 GeV and Λ_->284 GeV at the 95% C.L. The fractions of τ decays into one and three charged particles are B_1=0.864±0.003±0.003 and B_3=0.135±0.003±0.003.

43818 (CONF-8905143–8) **Lattice calculation of dilepton production in peripheral relativistic heavy-ion collisions.** Oberacker, V.E.; Umar, A.S.; Strayer, M.R.; Bottcher, C. Oak Ridge National Lab., TN (USA). [1989]. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. From NATO international advanced courses on the nuclear equation of state; Peniscola (Spain); 12 May - 3 jun 1989. Order Number DE89015369/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In this talk, I will concentrate on electromagnetic dilepton production in peripheral heavy-ion collisions at relativistic energies. For very heavy systems such as Au + Au,U + U the effective coupling constant $Z\alpha \approx 0.5$, thus casting doubt on the applicability of perturbation theory. We shall therefore utilize a nonperturbative lattice approach. The main problem to be solved is the Dirac equation for leptons in the presence of strong transient EM fields ($E_{max} = 10^{25}$V/m for U + U at RHIC energies). There are several motivations for these studies: We will be able to probe nonperturbative QED in an entirely new energy regime. The hadronic (Drell-Yan) production of dileptons has been widely discussed as a signature of the quark-gluon plasma phase transition. The dominant background will be the coherent EM pair production by the heavy ions in relativistic motion. Lepton pair production with capture of the negatively charged lepton by one of the ions is one of the most serious beam-loss mechanisms for relativistic heavy-ion colliders. 7 refs., 2 figs.

43819 (INFN-LNF–89-013(PT)) **New VDM prediction for time like form factors.** Dubnicka, S.; Etim, E. Istituto Nazionale di Fisica Nucleare, Rome (Italy). 1989. 12p. (CONF-8810407–: Nuclear structure workshop, Frascati (Italy), 27-28 Oct 1988). Order Number DE89632137/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A VMD model which incorporates improved analyticity properties of electromagnetic form factors of hadrons and unitarity corrections is presented. It is applied to the description of the electromagnetic structure of pions, kaons and nucleons. In the case of pions and kaons, contributing higher vector meson resonances are determined from the analysis of the processes $e^+e^- \rightarrow \pi^+\pi^-$ and $e^+e^- \rightarrow$Kaons anti-Kaons, respectively. In the case of nucleons the behaviour of the electric and magnetic form factors of the neutron in the time-like region is predicted.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

The six quark system is studied within the framework of nonrelativistic quark-cluster model. In calculations the quark-quark potential of one-gluon exchange is used and all symmetry types of wave functions are taken into account for excitation quanta N ≤ 2. The importance of all states taken into account is shown, the role of all the potential terms is studied. The addition of L=2 state to the ground one is about 5%. The obtained results slightly depend on the choice of confinement type. 6 refs.

In *Experimental and theoretical physics. Collection.* Order Number DE89012199/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 9.

Two-dmensional QCD on physical vector states is built. QCD_2 is considered in gauging A_0=0. This gauging does not fix gauge invariance completely. The vectors meeting the Gauss law are physical ones. Canonical formalism is used and relations are solved in two stages. The first stage is transformation to nonconverted fermions. At the second stage it is shown how to complete solution of relations and construct the physical hamiltonian. Physical QCD_2 is reduced to fermion fields interacting with chiral currents. 6 refs.

43834 (INIS-SU–103/A, pp. 40-42) **π^0->2γ decay width and chiral symmetry dynamical breaking in QCD.** Maglaperidze, T.I.; Tkebuchava, F.G. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Quantum radiophysics. Collection.* Order Number DE89012203/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 12.

It is shown that in frames of chiral symmetry breaking in QCD the π^0->2γ decay width much depends on quark propagator form in nonasymptotic region of Euclidean four-momenta. π^0-meson decay width is calculated on the basis of triangular quark diagram taking into account nonlocal character of π^0-meson field Yukawa vertex. 7 refs.; 1 fig.

43835 (INIS-SU–103/A, pp. 46-48) **Quantum mechanics modelling of quarkonium and superatoms.** Khvingiya, N.L. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Quantum radiophysics. Collection.* Order Number DE89012203/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 12.

In quasi-accurately-solved quantum-mechanical models with smooth step-like potential conclusions on the effect of different potential modifications on quarkonium and superatom spectra are made. For asymptotically free potential without containment 1D level is always above 2S, and the level sequence in phase transition r_0<0.12fm is the following: 1S,2S,1P,1D. At r_0>0.12 fm configuration is changed: 1S,1P,2S,1D. In case of toponium the level location points to role and position of the jump in interquark potential. In case of superatoms, at $r_0$2.1A (r_0-core radius) Coulomb degeneration takes place, and with further r_0 growth (from 2.3 to 180A) the level configuration sequence is 1S,1P,1D,2S. These regularities point to the ways of controlling zone structure of superatomic complexes. 8 refs.; 1 fig.

43836 (INS–741) **Pion-transfer reaction spectroscopy for deeply bound π^- states.** Yamazaki, Toshimitsu. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Mar 1989. 9p. Order Number DE89906507/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

A new type of spectroscopy using pion-transfer (n,p) and other charge-exchange reactions to study deeply bound π^- states in heavy nuclei is described. First, a general framework of Coulomb-assisted hybrid bound states is discussed, and structure of heavy π^- atoms is predicted. Then, π^- transfer reactions are theoretically studied, and current and future experimental possibilities are discussed. (author).

43837 (IYF–88-121) **On the Σ^*- and γ^*-hyperons wave functions.** Ogloblin, A.A. AN SSSR, Novosibirsk (USSR). Inst. Yadernoj Fiziki. 1988. 24p. Order Number DE89634577/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The properties of the leading twist wave functions of the Σ+(1385) and γ+(1530)-hyperons are invesigated using the QCD sum rules. the model wave functions which satsfy the sum requirements are proposed. The asymptotic behaviour of Σ^*- and $\gamma\pm$hyperons electromagnetic formfactors and that of various octet-decuplet transition formfactors is found. 11 refs.; 8 tabs.

Submitted to Z. Phys., C.

The low-energy limit of the Bethe-Salpeter equation with a relativistic kernel for quark-antiquark bound states is considered. It is shown that this limit as equivalent to a localization of the potential which becomes a special 4-quark Nambu-Jona-Lasinio one. The mass spectrum of the low-lying mesons is calculated without expanding in energy. Thereby the S-V, P-A and V-T mixings are taken into account exactly. Furthermore the pion decay constant is determined. We received good agreement with the experimental data. 11 refs.; 1 fig.; 3 tabs.; submitted to Z. Phys., C.

43839 (LBL–27234) **Space-time aspects of hadronic cascading in lepton nucleus scattering.** Gyulassy, M.; Pluemer, M. Lawrence Berkeley Lab., CA (USA). May 1989. 23p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8901115–4: Topical conference on electronuclear physics with internal targets, Stanford, CA (USA), 9-12 Jan 1989). Order Number DE89015228/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A Monte Carlo model of hadronic cascading in inelastic lepton nucleus scattering is constructed to investigate space-time scenarios consistent with the momentum space description of string models of multiparticle production. The prospects for resolving the ambiguity inherent in the definition of a formation length for composite hadrons are emphasized. 15 refs., 13 figs.

43840 (LBL–27481) **The electromagnetic penguin contribution to ϵ'/ϵ for large top quark mass.** Randall, L. Lawrence Berkeley Lab., CA (USA). 12 Jul 1989. 7p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8904226–6: 12. international workshop on weak interactions and neutrinos, 9-14 Apr 1989). Order Number DE89016304/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We investigate the electromagnetic penguin contribution to ϵ'/ϵ when the top quark mass is large. We find it depends sensitively on the top quark mass. 6 refs., 2 figs.

43841 (RAL–89-036) **Remarks about top quark signals at pp-bar colliders.** Phillips, R.J.N. Rutherford Appleton Lab., Chilton (UK). May 1989. 6p. Order Number DE89634579/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Conventional top signals at pp-bar colliders are based on leptons from semileptonic top decays t -> bl4u. Three aspects are briefly discussed. (i) Lepton isolation is the usual way to suppress backgrounds from b and c decays, but the unknown b -> u decays are more difficult to suppress than b -> c; also theoretical and experimental isolation do not always correspond. (ii) W -> l4u decay is the principal remaining background; there are new ways to separate top signals that exploit the associated jet multiplicity, or dileptons, or both. (iii) If conventional decays via real charged Higgs scalars t to bH+ occur, they could suppress conventional modes; however the subsequent decay H+ -> tau-bar4u plausibly has a big branching fraction and could generate observable signals (events with large missing P_T, isolated tau-jet or lepton, two isolated tau-jets) at present pp colliders. (Author).

43842 (SLAC-PUB–5003) **Effects of charged Higgs in τ decay.** Tsai, Yung Su. Stanford Linear Accelerator Center, Menlo Park, CA (USA). Jul 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00515. (CONF-8905144–3: Tau-Charm workshop, Stanford, CA (USA), 23-27 May 1989). Order Number DE89013982/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

An experiment to test the effect of charged Higgs exchange in τ decay is proposed. It is pointed out that in the decay $\tau^- \to \nu_\tau + \pi^-$

+ π^0 the effect due to Higgs exchange can be obtained by observing the angular distribution of the π^- in the rest frame of the $\pi^- + \pi^0$. For each value of invariant mass of the $\pi^- + \pi^0$ system, the π^- must have a unique p-wave angular distribution independent of the strong interaction if it is due to W^- exchange alone. Any s-wave interference with this p-wave angular distribution can be attributed to the scalar exchange. 9 refs., 1 fig.

43843 Quark core stars, quark stars and strange stars. Grassi, F. (Fermi National Accelerator Lab., Batavia, IL (USA)). *Zeitschrift fuer Physik [Sektion] C: Particles and Fields (F.R. Germany),* 44(1): 129-138 (Sep 1989).

A recent one flavor (zero temperature) quark matter equation of state is generalized to several flavors. It is shown that quarks undergo a first order phase transition. In addition, this equation of state depends on few parameters, one in the two flavor case, two in the three flavor case, and these parameters can be constrained by phenomenology. This equation of state is then applied to (1) the hadron-quark transition in neutron stars and the determination of quark star stability, (2) the investigation of strange matter stability and possible strange star existence. (orig.).

43844 Spectra of strings on nonsimply-connected group manifolds. Ahn, C. (Stanford Linear Accelerator Center, CA (USA)); Walton, M.A. *Physics Letters [Section] B (Netherlands),* 223(3/4): 343-348 (15 Jun 1989). DOE Contract AC03-76SF00515.

We use the orbifold approach to conform the formula of Felder, Gawedski and Kupiainen for the one-loop partition function of strings on nonsimply-connected group manifolds. (orig.).

43845 The $K_S^0K_S^0\pi^0$ system produced in π^-p interactions at 21.4 GeV/c. Rath, M. G. (University of Notre Dame, Notre Dame, Indiana 46556 (US)—Brandeis University, Waltham, Massachusetts 02254 Brookhaven National Laboratory, Upton, New York 11973—Brookhaven National Laboratory, Upton, New York 11973 (US)); Cason, N. M.; Bensin *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 693-705 (1 Aug 1989). DOE Contract AC03-76SF00098.

The $K_S^0K_S^0\pi^0$ systems, a pure C=+1 state, has been studied in the reaction $\pi^-p\rightarrow K_S^0K_S^0\pi^0n$ at 21.4GeV/c. The $K_S^0K_S^0\pi^0$ spectrum is significantly different from the $\bar{K}K\pi$ distribution observed in other lower-energy peripheral hadroproduction experiments. In addition to production of the $f_1(1285)$, evidence for production of the $\eta(1460)$ [sometimes called the $\iota(1460)$] based on mass spectra and a Dalitz-plot spin-parity analysis is reported. The narrower, lower-mass state observed in other $\bar{K}K\pi$ experiments is observed weakly if at all in this experiment. Hadronic production of the $\eta(1460)$, which is a good glueball candidate because of its presence in J/ψ radiative decay, suggests possible mixing with the $\bar{q}q$ sector.

43846 Exotic-quark production at e^+e^- colliders. Rizzo, T. G. (Physics Department, University of Wisconsin, Madison, Wisconsin 53706 (US)— Ames Laboratory and Department of Physics, Iowa State University, Ames, Iowa 50011 (US)). *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 754-759 (1 Aug 1989). DOE Contract AC02-76ER00881.

The prospects for discovering exotic quarks (h), present in E_6 models, at existing and future high-energy e^+e^- colliders are examined. The flavor-changing decay mode, $h\rightarrow$jet+l^+l^-, clearly separates the production of h from that of new sequential quarks. Although this mode has a small branching fraction, reasonable event rates at each of the various colliders is expected.

43847 Production of neutral bosons by an electron beam. Tsai, Y. S. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309 (US)). *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 760-768 (1 Aug 1989). DOE Contract AC03-76SF00515.

We investigate the possible existence of neutral bosons which are coupled to leptons. The cross section for the process $e+p\rightarrow e+X+$anything, where X is a neutral boson of spin-parity $0^\pm$ of $1^\pm$ emitted by the electron, is calculated and its energy-angle distribution discussed. Assuming X to decay predominantly into a lepton pair we investigate the characteristics of the background. It is pointed out that the signal-to-background ratio can be greatly enhanced if one selects high $x=E_X/E_1$ and also uses the outgoing electron as a tag at a slightly nonforward angle with the X particle arranged in such a way that the momentum transfer to the target particle is near its minimum. This happens when the outgoing electron momentum $\mathbf{P}_2$ is parallel to $\mathbf{P}_1-\mathbf{k}$, where $\mathbf{P}_1$ and $\mathbf{k}$ are the momenta of the incident electron and the X particle, respectively.

43848 Probing gluon polarization in hadronic direct photon production. Berger, E. L. (High Energy Physics Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Qiu, J. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 778-786 (1 Aug 1989). DOE Contract W-31-109-ENG-38.

Inclusive direct photon production at large transverse momentum in proton-proton interactions with a longitudinally polarized beam and target is an incisive probe of the polarized gluon density in a proton. To help motivate future experiments and assist in their design, we provide predictions of the polarization asymmetry for a range of reasonable choices of the polarized gluon density. The cross sections are small at fixed-target energies, but the effort to measure them is necessary if the polarized gluon density $\Delta G(x,Q^2)$ is to be determined. In order to obtain our predictions, we parametrize spin-dependent parton densities and compute their evolution with Q^2. Our densities provide good agreement with the spin-dependent structure function $g_1^p(x,Q^2)$ measured in deep-inelastic lepton scattering.

43849 Exclusive semileptonic decays of B and D mesons. Cline, J. M. (Department of Physics, The Ohio State University, Columbus, Ohio 43210 (DE)); Palmer, W. F.; Kramer, G. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 793-805 (1 Aug 1989).

Exclusive semileptonic decays of D and B mesons to one and two pseudoscalar mesons are studied with respect to form-factor dependence, finite-width effects in intermediate resonant states, and nonresonant background terms calculated from chiral Lagrangians. Branching ratios, electron decay spectra, and asymmetry parameters for angular distributions are given for Cabibbo-Kobayashi-Maskawa-favored and -unfavored transitions, and compared to experimental data.

43850 Exploration of the limits on charged-lepton-specific forces. Hawkins, C. A. (Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309 (US)); Perl, M. L. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 823-832 (1 Aug 1989). DOE Contract AC03-76SF00515.

This paper explores the present experimental limits on the existence of a hypothetical force which would only couple to charged leptons; the neutral particle carrying the force having a mass greater than several MeV/c^2. We consider limits from data on $g_e-2, g_\mu-2$, electron beam-dump experiments, $e^+e^-\rightarrow e^+e^-$, $e^+e^-\rightarrow\mu^+\mu^-$, and $e^+e^-\rightarrow\tau^+\tau^-$. Our purpose is to provide a basis for design of future experiments which would be more sensitive to the existence of a charged-lepton-specific force or other unknown phenomena connected to charged leptons.

43851 Relativistic description of quark-antiquark bound states. Spin-independent treatment. Gara, A. (Department of Physics, University of Wisconsin-Madison, Madison, Wisconsin 53706 (US)); Durand, B.; Durand, L.; Nickisch, L. J. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 843-854 (1 Aug 1989).

We present the results of a detailed study of light- and heavy-quark–antiquark bound states in the context of the reduced Bethe-Salpeter equation with static vector and scalar interactions. In the present paper, we consider the spin-averaged spectra. Spin effects are considered in a separate paper. We find that this approach, although apparently successful for the heavy-quark $\bar{b}b$ and $\bar{c}c$ states, fails for the $\bar{s}s$, $\bar{l}l$, and light-heavy states. The reasons for the failure are intrinsic to the method, as we discuss. Difficulties are already evident for the $\bar{c}c$ states.

43852 Neutron-proton mass-splitting puzzle in Skyrme and chiral quark models. Jain, P. (Center for Theoretical Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139 (US)); Johnson, R.; Park, N. W.; Schechter, J.; Weigel, H. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 855-865 (1 Aug 1989).

The nonelectromagnetic part of the *n-p* mass difference is known to vanish in the Skyrme model of pions. This result is shown to hold when the model is extended to include an isoscalar 0^- field. However the inclusion of vector mesons to describe "short-distance" effects enables the isoscalar 0^- field to contribute and this explains most of the *n-p* splitting in a two-flavor model. To carry out the analysis we make a detailed study of chiral-symmetry breaking in the pseudoscalar-vector Lagrangian. The contribution due to the strange constituents of the nucleon is also estimated. The sum of the two contributions is shown to be sufficient to explain the experimental number. Another way to discuss "short distance" effects is the explicit inclusion of quark degrees of freedom via the "chiral quark model." We show that this can also give rise to nonzero *n-p* splitting.

43853 Pion fluctuations around a moving and rotating Skyrmion. Liu, H. (Department of Physics, University of Pennsylvania, Philadelphia, Pennsylvania 19104 (DE)); Oka, M. *Physical Review [Section] D: Particles and Fields (USA)*, 40(3): 883-889 (1 Aug 1989).

Fluctuating pion fields around a moving and rotating Skyrmion are quantized by Dirac's method. Both the rotational and translational collective motion of the Skyrmion are described by collective coordinates and then all six zero-frequency modes of the pion field are eliminated. The method allows us to treat fluctuations around a soliton consistently with its collective rotational and translational motion. Pion-baryon linear couplings are studied and the $\Delta \rightarrow N\pi$ decay rate is calculated.

43854 High-p_T *W* and *Z* production at the Fermilab Tevatron. Arnold, P. (High Energy Physics Division, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Ellis, R. K.; Reno, M. H. *Physical Review [Section] D: Particles and Fields (USA)*, 40(3): 912-913 (1 Aug 1989).

In previous work, we and others have put together a full computation of $d\sigma/dq_T$ for the inclusive production of high-transverse-momentum *W*s and *Z*s to second order in QCD. Here, we present the results in graphs from which relevant cross sections may be extracted at a glance. Specifically, we plot $d\sigma/dq_T$ and $\int_{q_T} dq_T (d\sigma/dq_T)$ for the Fermilab Tevatron.

6453 Particle Invariance Principles and Symmetries

43855 *CP* violation in models with chiral color. He, X. (Research Center for High Energy Physics, School of Physics, University of Melbourne, Parkville, Victoria 3052, Australia (AT)); Rajpoot, S. *Physical Review Letters (USA)*, 63(5): 486-489 (31 Jul 1989).

We study *CP* violation in a chiral color model with exotic fermions transforming as singlets of the weak-isospin group $SU(2)_L$. The Higgs sector consists of a nonet of chiral color and the usual doublet of $SU(2)_L \times U(1)_Y$. In the limit in which the mixings between the third generation with the first two generations are small, *CP*-violating interactions are dominated by the exchange of neutral Higgs bosons. The *CP*-violating parameters ϵ and ϵ'/ϵ for the kaon system are easily accommodated. The neutron electric dipole moment is generated at the one-loop level and is $\sim 10^{-25}$–10^{-26} e cm.

43856 Strong *CP* violation and the neutron electric dipole moment. Liu, J. (Randall Laboratory of Physics, University of Michigan, Ann Arbor, Michigan 48109 (US)); Geng, C. Q.; Ng, J. N. *Physical Review Letters (USA)*, 63(6): 589-592 (7 Aug 1989).

We derive an identity that relates the fermion electric dipole moment from weak *CP*-violation effects to the strong *CP* parameter θ. In the absence of Peccei-Quinn-type symmetries, we find that requiring θ naturally small generally implies that, for a large class of models, the dominant contribution to the neutron electric dipole moment d_n comes from strong *CP* violation rather than directly from weak *CP*-violation effects.

43857 *CP*-violation phase hierarchy and minimal left-right models. Liu, J. (Randall Laboratory of Physics, University of Michigan, Ann Arbor, Michigan 48109 (US)). *Physical Review [Section] D: Particles and Fields (USA)*, 40(3): 914-917 (1 Aug 1989).

We discuss *CP* violation in a class of minimal left-right models. It is shown that an interesting phase hierarchy arises if, in an appropriate basis, the quark masses have a nontrivial relative sign. With such a phase hierarchy, we find that, even in the small-phase approximation, ϵ'/ϵ and the neutron electric dipole moment d_n can, respectively, be of the order 3×10^{-3} and 10^{-25} *e* cm with either sign.

We generalize the notion of Osterwalder-Schrader (OS) positivity to Euclidean field theory on Riemann surfaces. We prove that some bosonic and fermionic Euclidean free fields defined on a symmetric Riemann surface fulfill the reflection positivity. We show that the Hilbert space constructed by means of the reflection positive correlation functions coincides with the Fock space determined by quantum fields defined on the reflection invariant curves. The uniformization theorem allows to express the fields on a Riemann surface in terms of the free fields defined on the plane. (orig.).

Kratkie soobshcheniya po fizike.; no. 9.

A new type of fermion action on a lattice meeting functional integrals in symmetric (Weyl) quantization is found. The action is nonlocal and in the massless limit it is chirally invariant, i.e. it extends to Weyl (two-component) fermions. 9 refs.

43864 (JINR-E–2-88-557) **Nonlocality and stochastic quantization of field theory.** Dineykhan, M.; Namsrai, Kh. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics. 1988. 52p. Order Number DE89633913/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

Submitted to the journal Intern. J. Theor. Phys.

Concept of nonlocality is introduced into physics by means of stochastic context using Langevin and Schwinger-Dyson techniques. This allows as to reformulate finite theory of quantum field, free from ultraviolet divergences, based on the stochastic quantization method with nonlocal regulators. As a nonlocal regulator we choose any entire analytic function in the momentum space, which guarantees that our regularization method for any theory of interest does not violate basic physical principles such as unitarity, causality, and gauge invariance of the theory. Here we present regularization scheme for scalar, gauge and scalar electrodynamics theories. 31 refs.; 19 figs.; 2 tabs.; submitted to the journal Intern. J. Theor. Phys.

43865 Infinite-dimensional algebras, sine brackets, and SU(∞). Fairlie, D.B. (Durham Univ. (UK). Centre for Particle Theory); Zachos, C.K. *Physics Letters [Section] B (Netherlands),* 224(1/2): 101-107 (23 Jun 1989). DOE Contract W-31-109-ENG-38.

We investigate features of the infinite dimensional algebras we have previously introduced, which involve trigonometric functions in their structure constants. We find a realization for them which leads to a basis-independent formulation. A special family of them, the cyclotomic ones, contain SU(N) as invariant subalgebras. In this basis, it is evident by inspection that the algebra of SU(∞) is equivalent to the centerless algebra of $SDiff_0$ on two-dimensional manifolds. Gauge theories of SU(∞) are thus simply reformulated in terms of surface coordinates. (orig.).

43866 Constraints for conformal field theories on the plane: Reviving the conformal bootstrap. Lewellen, D.C. (Stanford Linear Accelerator Center, CA (USA)). *Nuclear Physics [Section] B (Netherlands),* 320(2): 345-376 (3 Jul 1989). DOE Contract AC03-76SF00515.

We obtain a number of results by reexamining conformal field theory on the plane, using only elementary mathematics in the process. In particular we rederive the constraints on conformal dimensions found by Vafa, using the crossing symmetry of four-point amplitudes; find stronger, inequality versions of these conditions which constrain the magnitude of the conformal dimensions of primary fields which can appear as intermediate states in a given amplitude; and study the conformal bootstrap perturbatively using the power-series expansions for conformal block functions. This latter approach gives constraints of a quite different type, in particular tree-level constraints on the central charge. (orig.).

43867 Conformal field theory and a topological quantum theory of vortices and knots. Chapline, G. (Lawrence Livermore National Lab., CA (USA)); Grossman, B. *Physics Letters [Section] B (Netherlands),* 223(3/4): 336-342 (15 Jun 1989). DOE Contract W-7405-ENG-48.

We examine the two-dimensional quantum field theory with topological action Tr $\int d^2\text{chi}\ \epsilon^{ij}(1/4F_{ij}[PHI^*, PHI]-D_iPHI^*D_jPHI)$. In the semi-classical limit the action will be dominated by self-dual vortices associated with singularities in the reduction of a four-dimensional topological theory to a Riemann surface. We propose that the creation operators for these vortices can be identified with the primary fields of a current algebra, and this leads to fractional statistics for the vortices. Expressing the Berry phase associated with unwinding a knot in terms of the phase for exchanging two vortices then provides a link between conformal field theory and the Donaldson theory of four-manifolds. If self-duality is imposed as a gauge condition, the low-temperature limit of the theory resembles the world-sheet action for a superstring. (orig.).

43868 Topological invariants and a gauge theory of the super-Poincare algebra in three dimensions. Brooks, R. (Stanford Linear Accelerator Center, CA (USA)). *Nuclear Physics [Section] B (Netherlands),* 320(2): 440-460 (3 Jul 1989). DOE Contract AC03-76SF00515.

Various aspects of superspace topology and N = 1 supersymmetry in 2 + 1 dimensions are explored. Non-minimal super Yang-Mills theory is used to construct a gauge theory of the N = 1 super-Poincare algebra. A topological Yang-Mills theory is given and used to compute elements of the cohomology classes of super-monopole moduli space. (orig.).

43869 Instantons and chiral Lagrangian. Choi, K. (Department of Physics, Carnegie Mellon University, Pittsburgh, Pennsylvania 15213 (US)); Kim, C. W. *Physical Review [Section] D: Particles and Fields (USA),* 40(3): 890-901 (1 Aug 1989).

We derive the chiral Lagrangian including instanton corrections in a consistent way. *CP* violation associated with the θ term in QCD is discussed in terms of this chiral Lagrangian. A particular emphasis is given to a phenomenological determination of m_u and θ. It is shown that, contrary to the previous conclusion that $m_u=0.56m_d$ and $\theta=0$, all three distinct cases (i) $0.56\geq m_u/m_d>0, \theta=0$, (ii) $m_u=0$, (iii) $0.56\geq m_u/m_d>0, \theta=\pi$ are phenomenologically acceptable depending on the strength of the instanton corrections. In cases (i) and (iii), the ratio m_u/m_d can be much smaller than the usually quoted value 0.56. As a result, the models of spontaneous *CP* violation which predict $|\theta|\gg 10^{-9}$ can be phenomenologically viable. Also in the axion models, because of the possibility of m_u/m_d being arbitrarily small, the cosmological upper bound on the axion decay constant can be relaxed.

43870 The delta expansion in zero dimensions. Cho, H. T. (Department of Physics and Astronomy, The University of Oklahoma, Norman, Oklahoma 73019 and Department of Physics, The Ohio State University, Columbus, Ohio 43210 (US)); Milton, K. A.; Pinsky, S. S.; Simmons, L. M., Jr. *Journal of Mathematical Physics (New York) (USA),* 30(9): 2143-2150 (Sep 1989).

The recently introduced δ-expansion (or logarithmic-expansion) technique for obtaining nonperturbative information about quantum field theories is reviewed in the zero-dimensional context. There, it is easy to study questions of analytic continuation that arise in the construction of the Feynman rules that generate the δ series. It is found that for six- and higher-point Green's functions, a cancellation occurs among the most divergent terms, and that divergences that arise from summing over an infinite number of internal lines are illusory. The numerical accuracy is studied in some detail: The δ series converges inside a circle of radius one for positive bare mass squared, and diverges if the bare mass squared is negative, but in all cases, low-order Pade approximants are extremely accurate. These general features are expected to hold in higher dimensions, such as four.

43871 Field theory of geometric *p*-branes. Ho, C. (School of Physics and Astronomy, University of Minnesota, Minneapolis, Minnesota 55455 (US)). *Journal of Mathematical Physics (New York) (USA),* 30(9): 2168-2176 (Sep 1989).

In this paper, *p*-brane field theory is constructed in terms of functions of geometric *p*-surfaces. Nambu–Goto *p*-brane dynamics is incorporated in the Dirac form. The field equation for toroidal *p*-branes in *p*+2 dimensions is exactly solved for, and is shown to admit an equally spaced mass-squared spectrum containing massless states.

A description of the various experiments and projects carried out during the period of this contract is given, together with references to all publications which have resulted from it to date. References are also given to contributed papers which contain results which have not yet been published or submitted. Most of the experiments were done at Argonne National Laboratory and cover the period from the first use of a superconducting linear accelerator with the tandem Van de Graaff to the use of ATLAS. A number of experiments were also done at the University of Notre Dame tandem facility and one at the Indiana Cyclotron Facility. A list of graduate and undergraduate students is given, as is a summary of support from the Department of Energy and the University of Kansas. 30 refs.

We have completed the analysis of the ^{3}He(π^+,pp)n reaction, and are working on the analysis of data for the ^{3}He(π^-,pn)p reaction. An experiment to study the $\pi + d \rightarrow 2p$ reaction at LAMPF was successful in studying incident pion energies as low as 6 MeV. Preliminary results have been reported, and work is continuing to improve the accuracy in the calculation of the fraction of pions in the incident beam. A proposal has been accepted by LAMPF for a new experiment, scheduled to run in the summer of 1990, to study pion absorption in ^{3}He and ^{4}He using an extensive scintillator time-of-flight system capable of detecting neutrons as well as charged particles. We are continuing to analyze data obtained in PSI in the search for the admixture of massive neutrinos in pion decay and have continued the search for fractionally charged particles. We are also fully involved in some major collaborations: the search for the decay $\mu^+ \rightarrow e^+ + \gamma$, and the study of anti-proton absorption in heavy nuclei. We are taking part in a U.Va.-PSI collaboration to measure pion beta decay to an accuracy of about 1%, using a large acceptance CsI detector to measure the π^0 following decay of stopped π^+ mesons. We have also been working on experiments to study electron scattering, using the SLAC-NPAS facility for nuclear physics and the electron accelerator at SACLAY in France. Data from experiment NE-9 at SLAC are being analyzed. This experiment, which was run near the end of 1987, is intended to separate the transverse and longitudinal cross sections for inclusive electron scattering in the QFS region. Experiment NE-8 measured the cross section for photo-disintegration of the deuteron in the GeV range. Some design work was carried out this year on Experiment NE-16 at SLAC, a study of the (e,e'p) reaction in ^{4}He, expected to run late in 1990.

relevance of the new results. Schmidt-Ott, W.D. (Goettingen Univ. (Germany, F.R.)). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

Multi-nucleon transfer reactions were used for the production of new isotopes in regions of neutron-rich actinides, lanthanides and particularly of neutron-rich iron, cobalt and nickel isotopes. Decay properties as radioactive half-lives, beta and gamma decay were measured and decay schemes constructed. Additional spectroscopic information was also collected for already known neutron-rich isotopes. Emphasis is placed on applications of our nuclear-physics results to the nucleogenesis. 38 refs., 9 figs. (author).

43882 (INS–707) **Production of nuclear fragments in high-energy nuclear collisions.** Sano, M. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Sep 1988. 26p. Order Number DE89906566/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The report reviews the systematics of experimental data for projectile fragmentations and related theories, and analyzes the momentum distributions of lithium-9 produced by the projectile fragmentation of exotic nucleus lithium-11. In addition, the coalescence model is reviewed and applied to the estimation of the formation probabilities for exotic nuclear species such as hypernuclei, mesonic atoms and H-particles. It has been considered that in the peripheral collisions the detected fragmentation F comes out of the parent nucleus A as a spectator without scattering with nucleons in the other nucleus B. In the present report, it is shown that a process of collisions of the fragment F with the nucleus B is also important. It is seen that contributions of both processes appear separately in the momentum distributions of lithium-9 produced by the fragmentation of lithium-11. Then, the coalescence model is outlined and an equation is derived which expresses the formation cross section of a composite particle. A similar procedure can be used to derive a general expression for the formation cross section of a nuclear fragment with Z protons and N neutrons. (N.K.).

43883 (INS–722) **Medium-energy spectrometer (PIK) and study of Λ hypernuclei via (π^+, K^+) reactions.** Akei, M.; Amann, J.F.; Chiba, J. and others. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Dec 1988. 6p. Order Number DE89906617/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

With an intension to intensively study hypernuclei via (π^+ K^+) reaction, a series of experiments has started at KEK 12GeV proton synchrotron. As a first step, a simple spectrometer system (PIK spectrometer) for 1 GeV/c region is conducted, and hypernuclear spectra of $_{\Lambda}{}^{56}$Fe and $_{\Lambda}{}^{12}$C are studied with this spectrometer. The PIK spectrometer is installed in the K2 beam line area of the KEK 12GeV PS. The momentum resolution of the spectrometer system is examined with a beam through run at around 720MeV/c, (π, p) reactions in the momentum region of 500MeV/c, and (π, K^+) reaction on ^{12}C target. The beamthrough run shows moMentum resolution of 4MeV/c (FWHM) which corresponds to 0.25% of the incident beam moMentum. In the (π, K^+) reaction on ^{12}C, an energy resolution of 5MeV is obtained for the 1^- ground state of ^{12}C. A missing mass spectrum of pion measured in the (π, p) reaction gives a momentum resolution consistent with the 5MeV resolution of the (π, K^+) spectrum of -Λ^{12}C. A $_{\Lambda}{}^{56}$Fe hypernuclear spectrum is measured by the PIK spectrometer. The energy resolution of the spectrometer for Fe spectrum is estimated at 5.5MeV, taking into consideration energy resolution for $_{\Lambda}{}^{12}$C and energy loss fluctuation in C and Fe targets. Although energy resolution is subject to further improvement, the spectrum shows a gross structure consistent with recent calculations. (N.K.).

43884 (INS–742) **Structure and formation of deeply bound pionic atoms.** Toki, H.; Hirenzaki, S.; Yamazaki, T.; Hayano, R.S. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Mar 1989. 36p. Order Number DE89906508/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

We have calculated spectra of deeply bound pionic atoms using the standard pion-nucleus optical-potential. The widths of the deeply bound states are found to be narrow and are considered as quasi-stable states even for the 1s state in ^{208}Pb. These unexpected results are caused by the repulsive pion-nucleus optical potential which pushes the pionic wave functions outwards so that the pion absorption by the nucleus is weakened. These deeply bound π^- states have hybrid character, somewhere between pionic nuclei and pionic atoms, constituting a pion halo around the nucleus. This result remains relatively unchanged by the use of different optical potentials, as far as they reproduce shallow pionic atoms. We propose to produce these deeply bound pionic atoms, hitherto untouched region, by using the 'pion-transfer' (n,p) reaction, where π^- is transferred to the target nucleus. We have calculated the cross sections for the formation of various deeply bound states via the (n,p) reaction. The calculated cross section increases rapidly with the nuclear charge and indicates that the detection of unexplored deeply bound pionic atoms is feasible. We comment also on the use of complex projectiles for the 'pion-transfer' reactions such as (d, ^{2}He). (author).

43886 (JINR-R–3-88-555) **Set-up for measuring neutron cross sections and radiation multiplicity from neutron-nucleus interaction.** Georgiev, G.P.; Ermakov, V.A.; Grigor'ev, Yu.V. and others. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Neutron Physics. 1988. 11p. (In Russian). Order Number DE89634663/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A multiplicity detector of the "Romashka" type has been used on the 500 m flight part of the IBR-30 pulsed reactor. The detector consists of 16 independent sections with NaJ(Tl) crystals with a total volume of 36 liters. The geometric efficiency of single-ray detection is ~ 80%. The gamma-ray to neutron detection efficiency ratio is $\geq$600 for neutrons with energies below 200 keV. This detector allows one to perform neutron capture and fission cross section measurements and to study gamma-ray multiplicity and resonance selfabsorption effects in the 20 eV-200keV neutron energy range. 3 refs.; 14 figs.

43887 (FRCEA-TH–151) **Subthreshold pion production in (p, π^{+-}) reactions at 180 and 201 MeV and (^{3}He, π^{+-}) reactions at 283 MeV.** Million, B. CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Recherche Fondamentale. 1987. 113p. (In French). Order Number DE89908089/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

Subthreshold-pion production in (p,$\pi^{\pm}$) reactions at 180 and 201 MeV and (^{3}He,$\pi^{\pm}$) reactions at 94 MeV/N is studied with several targets spanning the periodic table. Two analyzing systems have been used: a magnetic spectrometer and a range telescope. The results are discussed in detail and are compared to those of (^{12}C,π) experiments at 85 MeV/N. The independent-nucleon model is applied to the three reactions: (p,π), (^{3}He,π) and (^{12}C,π). Within this frame, pion production is calculated as an incoherent sum of NN -> πNN collisions where the momentum distribution of the target and projectile nucleons are taken into account. It is shown that this model, which is satisfying for high incident energies, cannot reproduce experimental results for incident energies lower than 300 MeV for the (p,π) reaction and 180 MeV/N for (^{3}He,π) and (^{12}C,π) reactions. In addition, qualitative estimate of the role of pion absorption in the target nucleus has been performed using a classical picture.

Recent developments in the study of nuclei far from stability are presented with an emphasis on those properties which bring informations on correlations in nuclei.

43889 (PCCF-T–8807) **Experimental study of deuteron production in α-particle collisions with C, Cu and Pb target nucleus at energies ranging from 200 to 800 A. MeV.** Montarou, G. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1988. 312p. (In French). Order Number DE89792008/JAW. Available from NTIS (US Sales Only), PC A14/MF A01.

Deuteron production in collisions between alpha-particle and carbon, copper or lead target nuclei at 200, 400, 600 and 800 MeV (Mega-electron Volt) per nucleon have been measured by using the large solid angle detector DIOGENE. Nucleus-nucleus collisions at intermediate energies offer the possibility of studying the properties of highly excited nuclear matter at high density and temperature. Among the different observables measured for the determination of the nuclear matter equation of state, light fragment production measurements has raised considerable interest during the last years because of the close relationship between entropy and nuclear cluster formation. A general presentation of the main experimental and theoretical aspects of the relativistic heavy ion collision is presented. The detector DIOGENE used at the SATURNE (Saclay-France) accelerator is described. This detector can measure simultaneously the momenta, masses and emission angles of most of the particles (pions, protons, deuterons ...) emitted in each collision. The method is described that is used to extract from the raw data the momentum, mass and emission angles of each particle measured in the detector. The deuteron production in central relativistic heavy ion collision is reviewed. Then we present the results of deuteron production measurements, using the DIOGENE detector. Deuteron differential cross-sections are compared with theoretical predictions obtained with intra-nuclear cascade model. Deuteron differential cross-sections are presented for the most central reactions. These spectra are investigated in order to extract the size of the interaction region at the end of the collision. Finally the deuteron-to-proton ratio is studied in relationship with the proton number measured in each event; this ratio is used to evaluate the entropy per nucleon in the most central collisions.

Measurement and analysis of cross sections for neutron-induced reactions of interest to the fusion energy program have been carried out. Studies have included the neutron-induced reactions of ^{9}Be, ^{10}B, ^{12}C, and ^{13}C. Level density studies have been carried out for reactions populating ^{57}Co. Low energy proton elastic scattering has been studied for targets of ^{54}Fe and ^{56}Fe. Data for these studies have been analyzed using either R-matrix studies, combined R-matrix and shell model calculations or Hauser-Feshbach calculations. Details of measurements and theoretical studies are given.

Spectra of electron inelastic scattering on ^{6}Li nucleus are measured in the LUEh-300 accelerator of the ChPhTI of Ukrainian Academy of Sciences. The contribution of the α-cluster quasielastic knock-out is estimated. The determinant role of this process in formation of low-energy continuum in inclusive electron spectra. 4 refs.; 1 fig.

43893 (INP–1302/PS, pp. 179-186) **Study of the giant Gamow-Teller resonance in nuclear beta decay: the case of ^{32}Ar.** Riisager, K. (0001700DK). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The question of the quenching of the Gamow-Teller strength in beta decay is briefly reviewed. A recent experiment on the decay of the proton-rich nucleus ^{32}Ar is described. This experiment gave a quenching factor of 49$\pm$5%. 11 refs., 3 figs. (author).

43894 (JINR-N–6(32)-88, pp. 4-10) **Observation of irregularities in inclusive momentum spectra of protons from nC and π^{-}C interactions.** Kechechyan, A.O. (Erevanskij Fizicheskij Inst., Erevan (USSR)); Shakhbazyan, B.A. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. (In Russian). In *JINR rapid communications. Collection of papers.* Order Number DE89012205/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; INIS.

Inclusive proton spectra from neutron and π^{-} meson interactions with carbon nuclei at 7 GeV/c and 4 GeV/c, respectively, are presented. Significant irregularities in the momentum range from 200 to 400 MeV/c are observed. Possible mechanisms able to explain these irregularities are considered. 13 refs.; 5 figs.; 1 tab.

43895 **Status of the bates parity violation experiment.** Kowalski, S. (Bates Linear Accelerator Center, Lab. for Nuclear Science and Dept. of Physics, Massachusetts Institute of Technology, Cambridge, MA (US)). vp. of Modern developments in nuclear physics. Sushkov, O.P. World Scientific Pub. Co., Teaneck, NJ (1988). (CONF-8706232–: International symposium on modern developments in nuclear physics, Novosibirsk (USSR), 27 Jun - 1 jul 1987).

An experiment designed to measure precisely the parity violating interference in the elastic scattering of longitudinally polarized electrons from ^{12}C is under way at the Bates Accelerator Center. The experiment required the construction of a high intensity polarized injector whose successful operation has been demonstrated. Present efforts are aimed towards the understanding and control of sources of systematic errors and completion of the measurements.

43896 (INIS-SU–100, pp. 86-91) **Detection of the γ-lines Doppler shift of the ^{24}Na radioactive decay.** Kupryashkin, V.T. (AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij); Stril'chuk, N.V.; Feoktistov, A.I.; Shapovalova, I.P. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in

nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

A new method of detecting the Doppler shift of γ-quanta energies due to the motion of recoil nuclei after preceeding β- and γ-irradiation is developed. Despite the low value of recoil nuclei velocity after β- or γ-irradiation ($V/c=10^{-4}$-$5x10^{-5}$) the method is reliable in detecting small shift values. The possibilities of the method are shown using ^{24}Na radioactive decay as an example. Radiation energy 2.7 MeV emitted directly after β^--particle in the opposite direction shifts by 61$\pm$6eV. The deceleration time of recoil nuclei in a solid source equalling $5,1x10^{14}$s is estimated, in this case the recoil nuclei pass $3.6x10^{-8}$cm. The above method opens new possibilities of studying the lifetime of highly excited states of nuclei in (n,γ) reactions on thermal neutrons ($T_{1/2}=10^{-13}$-10^{-15}s) and the processes of ion deceleration having low velocities in different materials. 4 refs.

43897 (IPNO-DRE–89-02) **β-delayed proton decay of ^{28}S.** Pougheon, F.; Borrel, V.; Jacmart, J.C.; Anne, R.; Detraz, C.; Guillemaud-Mueller, D.; Mueller, A.C.; Bazin, D.; Del Moral, R.; Dufour, J.P. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1989. 27p. Order Number DE89908093/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

β-delayed proton radioactivity has been observed for the ^{28}S isotope (T_x = -2), produced by projectile fragmentation of 85 MeV/u ^{36}Ar. The measured half-life of ^{28}S is 125 $\pm$ 10 ms. Energy spectra of β-delayed protons have been measured. The lowest T = 2 state in the daughter nucleus ^{28}P has been located at an excitation energy of 5900 $\pm$ 21 keV. A comparison of the experimental data to the quadratic form of the isobaric multiplet mass equation shows that the energies of the five T = 2 states of the A = 28 quintet are well represented by that relation. Shell-model predictions for the half-life, location and decay properties of the lowest T = 2 state of ^{28}P are in good agreement with experimental data.

The study of hypernuclei affords unique insights into the nature of hadronic forces beyond those obtainable from ordinary nuclear physics research. A hypernucleus consists of one or more hyperons bound to a nuclear core. In the SU(3) classification, Λ,Σ, and Ξ hyperons occupy the same octet representation of spin-parity $\frac{1}{2}^+$ baryons as the neutron and proton, the familiar constituents of ordinary nuclei. The Λ and Σ possess strangeness S = -1 and isotopic spin I = 0, 1, respectively, while the Ξ has S = -2, I = $\frac{1}{2}$. In the underlying quark picture, the Λ and Σ have the flavor structure $s(ud)_{I=0,1}$, compared to the combination uud for the proton. The strange quark, s, carries the strangeness quantum number S = -1, which makes it distinguishable from the S = 0 u and d quarks. The lowest-lying hyperon is the Λ, with a mass of 1,115.6 MeV/c^2, some 177 MeV/c^2 heavier than the proton. The study of the behavior of a hyperon embedded in the nuclear medium, through the theoretical analysis of level spectra, sheds light on the nature of the hyperon-nucleon (YN) effective interaction, i.e. on the role of the strange quark in strong interactions. This paper investigates the (π^+, K$^+$) reactions that produce hypernuclei. 32 refs., 5 figs., 2 tabs.

In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The procedure of experimental estimate of cross sections using standard cross sections (normales) is described. The main attention is paid to the precision of determination of efficiencies of registering analytical line γ-quanta in measurements whose unfavourable features are: source extension; measurement geometry with no respect to the assumption of geometry "point nature"; effects of γ-quanta self-absorption in a sample. It is shown that the unfavourable effect of the above factors on the precision of experiments can be excluded and the resulting precision of cross section determination equalling $\sim$ 3-5% obtained due to the measurement procedure suggested, in this case the absence of systematic errors is guaranteed. 7 refs.

Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

Results of recent experiments performed in IKP - KFA, Juelich in which coincident α- and ^{3}He-proton spectra were measured in reactions induced by fast α particles (43 MeV/N) interacting with light (^{58}Ni) and heavy (^{238}U) targets. 6 refs., 10 figs. (author).

43901 (ISN–88-62) **Alignment of protons and $h_{11}2$/neutrons and configurations of two quasi-particles in the Ba124 nucleus.** Martin, J.P. Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires. 1988. 140p. (In French). Order Number DE89908209/JAW. Available from NTIS (US Sales Only), PC A07/MF A01.

High spin states of ^{124}Ba, ^{125}Ba and ^{125}Cs have been populated in the reactions ^{98}Mo+^{34}S and ^{96}Zr+^{34}S at 160 MeV and ^{110}Cd+^{18}O at 80 MeV. They have been studied using spectroscopy techniques gamma-gamma angular distribution and linear polarization measurements with the french multidetector array Chateau de cristal. Seven collective bands have been established in ^{124}Ba. The negative parity bands in ^{125}Ba and ^{125}Cs, produced by the coupling of a $h_{11}2$/neutron-hole and $h_{11}2$/proton to doubly even core respectively, have been extended up to 47/2$^-$. According to aligned angular momenta and band crossing frequencies it is shown that the two positive parity bands in ^{124}Ba are generated by alignments of $h_{11}2$/neutrons and $h_{11}2$/protons, respectively. We also propose that the three negative parity bands are generated by coupling of two quasiparticles: $h_{11}2$/, $g_7 2$/quasi-neutrons and $h_{11}2$/, $g_7 2$/or $g_9 2$/ quasi-protons. Experimental data are compared to theoretical calculations made in a Woods-Saxon model. These calculations show that a $h_{11}2$/proton pair alignment is associated with a prolate collective behaviour while a $h_{11}2$/neutron pair alignment increases the triaxial character of the nucleus. Systematics of crossing frequencies and beta and gamma deformations associated with $h_{11}2$/proton and $h_{11}2$/neutron bands are given for doubly even baryum nuclei.

43902 (LBL–27387) **Decay studies of nuclei near the proton drip line: ^{35}Ca, ^{31}Ar, ^{69}Br, ^{65}As.** Reiff, J.E. Lawrence Berkeley Lab., CA (USA). Jun 1989. 100p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. Order Number DE89015342/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

Studies of new beta-delayed two-proton emitters and a search for ground state proton radioactivity in medium mass nuclei were performed using various experimental techniques in conjunction with several detection systems. A helium-jet transport system and three-element silicon telescopes were used to discover the existence and detect the decay of the first T_Z = $-5/2$ nuclide, ^{35}Ca. Two-proton emission from the T = 5/2 isobaric analog state in ^{35}K at an excitation energy of 9.053 $\pm$ 0.045 MeV, fed by the superallowed beta decay of ^{35}Ca, resulted in transitions to both the ground state and first excited state of ^{33}Cl. The corresponding two-proton sum energies were 4.089 $\pm$ 0.030 MeV and 3.287 $\pm$ 0.030 MeV.

Measurements of the individual proton energies indicated the prevalence of a sequential decay mechanism. Using the isobaric multiplet mass equation, the mass excess of ^{35}Ca was calculated to be 4.453 ± 0.060 MeV. In order to study whose half-lives were too short for the helium-jet system, an in-beam recoil catcher wheel was constructed. The wheel speed can be varied to study nuclides whose half-lives range from 100 μs to ~250 ms. The first new decay observed with the wheel system and traditional ΔE-E telescopes was the beta-delayed two-proton emission from ^{31}Ar. The two-proton sum energy of ~7.5 MeV corresponds to a transition from the isobaric analog state in ^{31}Cl to the ground state of ^{29}P. The search for proton radioactivity required the development of low energy, particle identification detector telescopes. These telescopes, comprised of a gas ΔE and silicon E, were used in conjunction with the in-beam recoil catcher wheel to search for ground state proton emission from ^{69}Br and ^{65}As. 90 refs., 24 figs., 8 tabs.

Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Among the unusual features of neutron-rich A≃100 nuclei is a sudden change of nuclear shape. The analysis of B(E2) and B(M1) values from recent level lifetime measurements indicates that Sr (and perhaps also Zr) nuclei obtain their largest deformations for the nuclei at the onset of deformation, which suggest a "phase change" from a spherical to a maximally deformed shape. 15 refs., 6 figs.

43907 (INIS-SU–100, pp. 29-34) **How much does the value of the coefficient of the mixture δ^2(E2/M1) for the 35,48 keV transition in the ^{125}Te nucleus depend on the way of its determination?.** Davidonis, R.J.; Zhirgulevichius, R.K.; Kalinauskas, R.A. and others. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The experiments aimed at measuring small changes of intensity ratios of ^{114m}In gamma-lines when radionuclides are in various chemical compounds, are reported. The effect studied is conditioned by the effect of the chemical change of radionuclide electron structure on the probability of ^{114m}In branch decay occurring by way of electron capture which in this case can be neasured by no other known method. The technique of control and exception of systematic errors is developed. The maximum measurement accuracy in the experiments of this type is estimated. The measurements and results processing are performed using a computerized γ-spectrometer. The sensitivity of determination of the relative change of $\Delta I_\gamma/I_\gamma$ intensity about $1x10^{-4}$, is obtained. The effects at the level of several units on 10^{-4} are observed. 6 refs.; 2 figs.; 1 tab.

Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

In order to populate ^{145}Eu levels above the yrast line, including members on low-lying particle x phonon multiplets, low-spin (p,3n), (t,2n) and (d,n) compound reactions have been used. The ^{145}Eu level scheme is shown. In experiment eleven negative parity states between 1.3 and 1.9 MeV which are assign as members of the two low lying octupole multiplets are found. A synopsis of the calculated and observed octupole mulptiplet members based on the three lowest single proton states $d_5 2/^{-1}$ (0 keV), $g_7 2/^{-1}$ (330 keV), and $h_{11} 2/$(716 keV) is given and these three multiplets are discussed. 8 refs., 5 figs. (author).

43915 Decays of millisecond isomers in odd-odd N=81 nuclei ^{146}Tb, ^{148}Ho and ^{150}Tm. Broda, R. (Purdue Univ., Lafayette, IN (USA)); Daly, P.J.; McNeill, J.H.; Grabowski, Z.W.; Janssens, R.V.F.; Lawson, R.D.; Radford, D.C. *Zeitschrift fuer Physik A: Atomic Nuclei (F.R. Germany),* 334(1): 11-17 (Sep 1989). DOE Contract W-31-109-ENG-38.

Following reactions induced by 245 MeV ^{60}Ni ions, isomers have been identified in the odd-odd N=81 isotones ^{146}Tb, ^{148}Ho and ^{150}Tm with half-lives of 1.18(2), 2.35(4) and 5.2(3) ms, respectively. Their decays have been characterized by γ-ray spectroscopy. The isomers are interpreted as ($\pi h_{11} 2/\nu h^{-1}{}_{11} 2/$)$10^+$ states decaying to members of $\pi h_{11} 2/\nu d^{-1}{}_3 2/$and $\pi h_{11} 2/\nu s^{-1}{}_{1/2}$ multiplets. The observed level spectra and M1 branching ratios are found to be in good agreement with shell model predictions based on empirical and Schiffer-True $\pi\nu^{-1}$ residual interactions. (orig.).

43916 (GANIL-P–89-02) **β-delayed neutron emission of the isotopes ^{20}C, ^{40}P, ^{41}P, ^{42}P and ^{43}S, ^{44}S.** Mueller, A.C.; Guillemaud-Mueller, D.; Anne, R.; Bazin, D.; Detraz, C.; Guerreau, D.; Saint-Laurent, M.G.; Borrel, V.; Jacmart, J.C.; Pougheon, F. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1989. 10p. Order Number DE89908094/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

Very neutron-rich isotopes have been produced by the fragmentation of 55 MeV/u ^{48}Ca projectiles from GANIL onto a ^{181}Ta target. The nuclei were separated by means of the doubly achromatic spectrometer LISE and implanted into a semiconductor telescope for identification in Z and A. Their β-delayed neutron radioactivity is observed by means of a 4 π β-n coincidence detector. The results include first measurements of the halft-life $T_{1/2}$ and the neutron emission probability P_n for the isotopes ^{20}C, ^{40}P, ^{41}P, ^{42}P and ^{43}S, ^{44}S. They are compared to current theoretical predictions.

43917 (INIS-SU–100, pp. 9-14) **Precision of determination of the energies and intensities of transitions from the data on internal conversion electrons.** Sushkov, P.A. (AN SSSR, Leningrad (USSR). Inst. Yadernoj Fiziki); Mak Magon, T.D. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The data on ICE for the ^{103}Rh(n,γe) reaction measured using the magnetic β-spectrometer (BILL), Grenoble, France, are analyzed. About 400 peaks in the 14-800 keV energy range are found in the ICE spectrum. The energies and intensities of ICE peaks are determined, energies and intensities of ^{104}Rh transitions are specified, multipolarities of about 200 transitions are determined. It is shown

that it is possible to determine transition energies with the precision up to 3ppm and transition intensities-with the precision ~ 1% using the ICE spectra. The data on 31 and 77 keV transitions from the ^{103}Rh M3 reaction and E3 multipolarities, respectively, are given. Gamma intensity of 31 keV transition equalling 27,5(14)x10^{-6} kV/100n is obtained. The data for ^{104}Rh Auger electrons are given. 5 refs.; 1 fig.; 3 tabs.

43918 (INIS-SU–100, pp. 15-19) **Precision measurements of the energy of some transitions of the ^{184,184m}Re decay.** Bulgakov, V.V. (AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij); Lashko, A.P.; Sidorenko, L.P. and others. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The magnetic high-resolution beta-spectrometer of the $\pi\sqrt{2}$ type has been used to measure the energy differences of close conversion lines directly in eV. In this case one of the lines referred to ^{183}Re decay where the transition energies are known with high precision, the other - to ^{184,184m}Re decay. The values of transition energies that can be used for spectrometer calibration are obtained. The technique of measurements is discussed. 4 refs.; 1 tab.

43919 (INIS-SU–100, pp. 3-8) **Precision limits for the data, obtained by β-spectrometers $\pi\sqrt{2}$(rho$_0$=50 cm) within the 5-2000 keV electron spectra range.** Kartashov, V.M. (AN Kazakhskoj SSR, Alma-Ata (USSR). Inst. Yadernoj Fiziki); Oborovskij, A.I.; Troitskaya, A.G. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

It is shown that the pulse resolution attained in the devices of this type is ~0.05% in the range E$_e$=5-30 keV and 0.03-0.02% for E$_e$>30keV. In this case we can clearly register lines 10^6 times differing in intensity. The requiremenrs to the quality and thickness of layer of solid radioactive source placed on substrate, to the type of its material, its effect on shape and width of lines in a wide energy range, the order in atom location, medium of electron passing, possibility of spectra calibration (in energy) in the 5-10 keV energy range are discussed. It is shown that the use of relative H$_{rho}$ measurements for two electron lines corresponding to one and the same γ-transition permits to attain precision in energy distribution within the whole range discussed 1x10^{-4}-5x10^{-5}. The relative accuracy of determining the intensity of the strongest lines can reach 0.5%. 8 refs.; 3 tabs.

43920 (INIS-SU–100, pp. 130-132) **On experimental determination of the kind of the decay law at a short period of detection.** Gopych, P.M. (Khar'kovskij Gosudarstvennyj Univ., Kharkov (Ukrainian SSR)); Demchenko, M.N.; Zalyubovskij, I.I. and others. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

A number of theories predict the deviations from the exponential decay for short detection times t/T$_{1/2}$->O: either short-period oscillations or decay deceleration (Zenon quantum effect) are expected. The experimental data of this paper and the literary data are used to analyze the degree of experimental research of the type of the decay law for the nuclei of one "age" for detection period 10^{-10}< or approx. t/T$_{1/2}$ < or approx.10^{-1}. It is shown that the available experimental data do not permit to speak about the detecting (in this time range) of deviations from exponentiality the etails of experiments are discussed. 5 refs.; 1 fig.

43921 (INP–1302/PS, pp. 73-80) **Longlived high-spin states in deformed nuclei-particle alignment and nuclear shape.** Emling, H. (Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.)). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

On the ground of the experimental data a spin dependence of the nuclear shape has been shown. In both regions of transitional rare earth nuclei (of prolate ground-state deformation $\beta\geq$0.2, the N=87, 88 isotopes Er, Dy and the N=104-107 Os isotopes) the two-quasiparticle states ν(i$_{13}$2/) seem to induce triaxial shape. At still higher spins the oblate configuration seems to be energetically favoured against the prelate configuration as was found in the N=87, 88 region. 10 refs., 4 figs. (author).

43922 (INP–1302/PS, pp. 81-99) **Gamma-decay from Dy nuclei at high temperature.** Guttormsen, A. (Oslo Univ. (Norway). Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

States up to high excitation energies have been populated in the ^{161,163}Dy(d,t) and ^{162,163}Dy(^{3}He,αxn) reactions. The γ-decay following the pick-up reactions is investigated using Ge and NaI detectors. Both reactions reveal characteristic γ-ray bumps and the global properties of these bumps are emphasized. The origin of 1 MeV and 2 MeV γ-ray bumps is discussed within a modified Fermi gas model. 8 refs., 11 figs., 1 tab. (author).

43923 (INP–1302/PS, pp. 321-323) **G-factors of collective states of ^{166}Er.** Alzner, A. (ISKP Bonn (Germany, F.R.)); Bodenstedt, E.; Gemuenden, B.; Hoff, J. van den. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The variation of g-factors as a function of angular momentum has been studied for spins up 8$^+$ for the nucleus ^{166}Er. The g-factors of the 4$^+$-265 keV state, the 8$^+$-911 keV state and the 6$^+$-1216 keV state were obtained by use of the integral perturbed γ-angular correlation technique (IPAC). 5 refs., 5 figs. (L.I.).

43924 (INP–1302/PS, pp. 413-416) **Study of the nonequilibrium process for individual channels of the ^{159}Tb(α, charged particle xn) reactions.** Bochev, B. (Bylgarska Akademiya na Naukite, Sofia (Bulgaria). Inst. za Yadrena Izsledvaniya i Yadrena Energetika); Kutsarova, T.; Lieder, R.M.; Morek, T.; Didelez, J.P. DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

Beta decay energies for nuclei located at the end of long chains of alpha decay have been measured in order to determine masses of wide range of nuclei far from the beta stability line. 15 refs., 4 figs., 3 tabs. (author).

43926 (JINR-R–7-88-388) **Production of light nuclei in boron-11 and neon-20 heavy ion reactions with 18-20 MeV/nucleon energies.** Belozerov, A.V.; Borcea, K.; Gul'bekyan, G.G. and others. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Reactions. 1988. 14p. (In Russian). Order Number DE89634676/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The energy and angular distributions of light nuclei with $2 \leq Z \leq 8$ and $3 < A < 20$, formed in the ^{181}Ta (^{232}Th) + ^{20}Ne (18 MeV/nucleon) and ^{181}Ta(^{232}Th) + ^{11}B (20 MeV/nucleon) reactions are presentd. It is shown that isotopes with atomic and mass numbers close to the projectile Z and A values are formed basically in transfer reactions. To the formation of lighter products several processes contribute: prompt and sequential breakup of the projectile after massive transfer, and also cluster evaporation either from an excited composite system or from a residual nucleus. It is found that the yield of Li and Be isotopes rises by about two orders of magnitude when increasing the projectile energy from 8 and 18 MeV/nucleon. Further perspectives for the synthesis of ^{10}He and ^{13}Li and for the production of secondary beams of ^{6,8}He and ^{8,9}Li nuclei are analyzed. 16 refs.; 13 figs.; 2 tabs.

43927 (INIS-SU–100, pp. 35-40) **Precise ICC measurement of the high multipolarity transitions.** Zheltonozhskij, V.A. (AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Yadernykh Issledovanij); Ukhin, M.A. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The methods of γ-spectroscopy are used to measure internal conversion coefficients (ICC) on the K-shell and total ICC for M4,E4,E5-multipolarity transitions. The research is carried out using the ^{202,204}Pb, ^{197}Pt, ^{114}In isomers. The data obtained prove that the observed systematic excess of theoretical ICC for M4-multipolarity transitions as compared with the experimental values is most probably connected with the contribution of "intranuclear" conversion. 13 refs.; 2 figs.

43928 (INP–1302/PS, pp. 236-277) **Laser spectroscopic studies of the isotopic variation of nuclear charge radii.** Rebel, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik 3). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The importance of laser spectroscopic measurements of isotope shifts and hyperfinestructure splittings in long isotopic series of stable and radioactive nuclides for nuclear structure studies is demonstrated by recent experiments with Pb, Sn and Sr-isotopes. First measurements of Am by optogalvanic laser spectroscopy are discussed stressing methodical aspects. 55 refs., 31 figs. (author).

43929 (INP–1302/PS, pp. 346-349) **E0 decay of 0$^+$ states in ^{208}Pb.** Julin, R. (Jyvaeskylae Univ. (Finland). Dept. of Physics); Kantele, J.; Luontama, M.; Passoja, A.; Trzaska, W.; Blomqvist, J. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

A conversion-electron spectrum from the ^{207}Pb(d,p)^{208}Pb reaction at E_d=10 MeV is obtained. It exhibits two strong high-energy E0 lines corresponding to transition energies of 4863±5 keV and 5233±5 keV in Pb. These energies agree with those for the neutron -and proton - pairing vibrational 0$^+$ states. In addition to known E1 transitions from strongly populated 1$^-$ states, many new high-energy electron lines are observed in this spectrum. These lines can be identified with new M2 and E3 transitions from known lines to the ground state in ^{208}Pb. 4 refs., 2 figs. (M.F.W.).

43930 (INP–1302/PS, pp. 365-368) **Evidence for 0$^+$ intruder states in the even-even Pb nuclei.** Van Duppen, P. (Louvain Univ. (Belgium). Inst. for Nuclear- and Radiationphysics); Coenen, E.; Deneffe, K.; Huyse, M.; Wood, J.L. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

We report on the identification of 0$^+$ intruder states in the $^{190-200}$Pb nuclei. The β^+/EC decay of $^{192-200}$Bi was used to search for 0$^+$ states in $^{192-200}$Pb (charactrerised by their E0 groundstate transition). A 0$^+$ state in ^{190}Pb was identified in the α decay of ^{194}Po. 14 refs., 2 figs., 1 tab. (author).

43931 (INS–738) **Alpha decays of ^{221}Pa and ^{218,219}Ac.** Miyatake, H.; Nomura, T.; Kubono, S. and others. Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study. Mar 1989. 22p. Order Number DE89906504/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The α-decays of neutron deficient actinium (^{218,219}Ac) and protoactinium (^{221}Pa) nuclides produced in the ^{16}O-bombardment of ^{205}Tl and ^{209}Bi have been studied using a gas-filled recoil isotope separator (GARIS). Their α-decays were detected with a large Si counter placed at a focal plane of GARIS. The α-decay energy of ^{221}Pa has been measured for the first time to be E_α = 9.08 ± 0.03 MeV. The half-lives of ^{221}Pa, ^{218}Ac and ^{219}Ac were determined more precisely than those reported previously; they are 5.9 ± 1.7, 1.06 ± 0.09 and 11.8 ± 1.5 μs, respectively. The present value for ^{219}Ac is significantly different from the previous measurement. The reduced α-widths of N = 130 isotones are compared with the shell model calculations. (author).

Radioactive ^{241}Am sources have been used extensively for many years for the absolute efficiency calibration of Si(Li) detectors. However in most of these cases the Np X-rays produced by the alpha decay of ^{241}Am have been considered as coming from only four distinct groups, the M, L α, L β and L γ groups. Modern Si(Li) detectors, with resolutions upwards of 140 eV, are capable of resolving more than 20 X-ray lines from these groups between 2 and 25 keV. This fact coupled with the well established γ-ray transitions at 26, 33, 43 and 59 keV make ^{241}Am sources ideal for the absolute efficiency calibration of Si(Li) detectors in the 1 to 60 keV X-ray region. Here we identify some 39 Np M and 39 Np L transitions from the decay of ^{241}Am and present the relative intensities of the 28 resolvable X-ray peaks using a Si(Li) detector. Their ^{241}Am X-ray branching ratios together with the efficiency models presented in earlier papers and the γ-ray relative intensities enable the absolute

calibration of a Si(Li) detector using just one source over the photon energy range 1 to 60 keV.

Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

Using triton projectiles for γ-spectroscopy enabled me to study a few simple configurations close to ^{208}Pb. Particularly some informations on proton-hole states about which very little is known, could be gathered. The g-factor of the $h_{11}2$/hole agrees with that what is expected from its spin-orbit partner, while its effective charge is larger. With heavy ion beams N=126 and N=128 isotones have been studied. Magic N=126 isotones can in part be astonishingly well explained by the most simple pairing model, when the levels of highest spin are taken as the unpaired reference states. The N=128 nuclei show a very steady trend versus proton number, their level schemes and electromagnetic properties agree with shell model except for an increased effective quadrupole charge. 32 refs., 17 figs., 3 tabs. (author).

43936 Multifragment emission observed for the reaction ^{36}Ar + ^{238}U at *E/A*=35 MeV. Kim, Y. D. (National Superconducting Cyclotron Laboratory and Department of Physics Astronomy, Michigan State University, East Lansing, Michigan 48824 (US)); Tsang, M. B.; Gelbke, C. K.; Lynch, W. G.; Carlin, N.; Chen, Z.; Fox, R.; Gong, W. G.; Murakami, T *Physical Review Letters (USA),* 63(5): 494-497 (31 Jul 1989).

The dependence of multifragment-emission processes upon linear momentum transfer to the target residue is determined for ^{36}Ar-induced reactions on ^{238}U at *E/A*=35 MeV. Significantly more intermediate-mass fragments are emitted in central collisions. Multiplicity distributions for intermediate-mass fragments emitted behind the grazing angle resemble Poisson distributions and are consistent with a stochastic production process. Exit channels with up to five intermediate-mass fragments and two fission fragments were observed.

This report contains two papers dealing with giant electric multipole resonances. Included in the 1987 progress report of Italian nuclear theoreticians, the theoretical analyses lie within the framework of the direct-semidirect model for nuclear radiative capture and the interacting boson model for photonuclear reactions. Specifically, the first compares the shell model and phenomenologic approaches to particle-vibrations coupling in the direct-semidirect model of radiative capture of fast nucleons and evaluates effects on the determination of measurable quantities. The second deals with the fragmentation of the giant dipole resonance in an algebraic model.

43942 (GSI–89-45(prepr.)) **Relativistic effects in molecular dynamics simulations of heavy-ion collisions.** Schmidt, R.; Kaempfer, B.; Feldmeier, H.; Knospe, O. Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.). May 1989. 10p. Available from Gesellschaft fuer Schwerionenforschung m.b.H., Darmstadt (Germany, F.R.).

We compare the results of a non-relativistic molecular dynamics simulation with that of an approximate relativistic one which is Lorentz-invariant up to order $(v/c)^2$. We find a drastic increase of the transverse flow caused by the momentum dependence of the relativistic forces. In addition the relativistic retardation effect is clearly seen in time evolution of the mean multiplicity of clusters. (orig.).

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).
The contribution of relativistic spin flip effect into electromagnetic deuteron structure is calculated. It is shown that this effect results in considerable reconstruction of quadrupole form factor and deuteron polarization $T(Q^2)$ in the diffraction minimum region. Spin flip slightly contributes to the charge and magnetic form factors. 4 refs.; 2 figs.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).
The general dependence of cross sections of inclusive and exclusive γd- and ed-interactions on tensor polarization of the target is elucidated. Analysis is carried out for formalism of structure functions. Asymmetry properties caused by tensor polarization of the target for the impulse approximation are established. Numerical estimations of a number of asymmetries for α-vector(e,e'p)n process are carried out on the basis of a relativistic version of the impulse approximation. 20 refs.; 7 figs.

43953 (INIS-SU–96, pp. 51-54) **Disintegration of vector-polarized deuteron by longitudinally polarized electrons and form factors G_{En}.** Rekalo, M.P. (AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Scientific-technical collection of papers.* Order Number DE89012202/JAW. Available from NTIS (US Sales Only), PC A07/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

Sensitivity to electric form factor G_{En} of a neutron of polarization observables in the d-vector(e-vector, e'p)n reaction in the model of relativistic impulse approximation is studied. The effect of different uncertainties (freedom in the choice of a deuteron wave function, experimental data errors for neutron magnetic form factor in the range of medium and large values of transferred 4-momentum squared) on the possibility of G_{En} determination is studied. The method for determining neutron electric form factor G_{En} on the basis of polarizaion observables in the reaction of vector-polarized deuteron target disintegration by longitudinally polarized electrons in the exclusive d-vector(e-vector, e'p)n experiment in the quasielastic scattering region is the least model-dependent one. 6 refs.; 2 figs.

43954 (INIS-SU–96, pp. 59-61) **Determination of magnetic structure functions in electron scattering on deuteron at q^2=0.7...1.2 GeV^2.** Titov, Yu.I. (AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst.); Kasatkin, Yu.A.; Akhmerov, R.V.; Esaulov, A.S.; Nagornyj, S.I.; Smelov, E.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

Electromagnetic form factors and differential cross section of $e^- + d \rightarrow e^- + n + p$ process near the threshold are calculated. Sensitivity of these values to the choice of deuteron wave functions and parametrization of nucleon electromagnetic current outside the mass surface is studied. 10 refs.; 2 figs.

43957 (INIS-SU–96, pp. 72-77) **Deuteron structure in photo- and electrodisintegration reactions.** Kasatkin, Yu.A. (AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst.); Nagornyj, S.I.; Inopin, E.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1987. (In Russian). In *General and nuclear physics. Scientific-technical collection of papers.* Order Number DE89012202/JAW. Available from NTIS (US Sales Only), PC A07/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

On the basis of covariant approach structure effects in deuteron photo- and electrodisintegration reactions are analyzed. In photodisintegration reactions attention is paid to gauge invariant accounting for the deuteron structure and investigation of the role of nucleon electromagnetic form factors. In reactions with electrons the near-threshold region of deuteron breakup is investigated. 16 refs.; 2 figs.

43958 (INIS-SU–96, pp. 78-81) **Masking of quark effects in NN interaction and in electron-nucleus scattering.** Obukhovskij, I.T. (Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Kusainov, A.M.; Neudachin, V.G. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Tsentral'nyj Nauchno-Issledovatel'skij Inst. Informatsii i Tekhniko-Ehkonomicheskikh Issledovanij po Atomnoj Nauke i Tekhnike. 1987. (In Russian). In *General and nuclear physics. Scientific-technical collection of papers.* Order Number DE89012202/JAW. Available from NTIS (US Sales Only), PC A07/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

It is shown in electron scattering on lightest nuclei at high transferred momenta and low excitation energies the contribution into the cross section of the six-quark component is considerably masked by destructive interference of diagonal 6q reversible 6q and nondiagonal NN reversible 6 q transitions. As a result, the dramatic discrepancy between new data on magnetic scattering and hybrid model predictions is eliminated. 17 refs.; 3 figs.; 1 tab.

43959 (INIS-SU–96, pp. 88-90) **Conservation of electromagnetic current and deuteron structure in covariant approach to the $\gamma d \rightarrow pn$ reaction.** Barannik, V.P. (AN Ukrainskoj SSR, Kharkov (Ukrainian SSR). Fiziko-Tekhnicheskij Inst.); Kulish, Yu.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). The multipole analysis of the γd -> pn process is carried out on the basis of experimental data on $d\sigma/d\Omega$, Σ asymmetry, proton polarization of P and T asymmteries caused by deuteron vector polarization at photon energy from 250 to 600 MeV ($2.11 \leq \sqrt{S} \leq 2.40$ GeV). The deuteron photodisintegration amplitudes are determined by contributions of three parts: a set of gradient-invariant pole amplitudes taking into account the deuteron structure, phenomenological amplitudes of pion photoproduction on nucleons and dibaryon resonances. It is shown that the x^2/df functional depends on sets of dibaryon resonances much stronger than on the used deuteron wave functions. 10 refs.; 3 figs.; 1 tab.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

The charge density distribution (CDD) of 1s-1p and 1d-2s-shell nuclei are calculated in the harmonic oscillator model taking into account proton finite dimensions and centre-of-mass motion effects. The population numbers n differ from 0 or 1, and they are determined on the basis of comparison of the calculated CDD values with the model-independent one. It is shown that the rho(0) decrease, when neutrons are added to the nucleus, is caused not only by the oscillator parameter increase, but also by the n population number growth. The CDD calculated and model-invariant data are in good agreement. 1 ref.; 1 tab.

43969 (INIS-SU–96, pp. 116-118) **Isoscalar giant dipole resonances of ^{16}O and ^{40}Ca nuclei.** Gul'karov, I.S. (Tashkentskij Politekhnicheskij Inst., Tashkent (USSR)); Mansurov, M.M. Scientific-technical collection of papers.* Order Number DE89012202/JAW. Available from NTIS (US Sales Only), PC A07/MF A01; INIS.

Voprosy atomnoj nauki i tekhniki.; no. 2(38); no. 3(39).

Form factors and transition charge density (TCD) of giant dipole resonances of ^{16}O and ^{40}Ca nuclei, isospin-forbidden, are calculated on the basis of the sum rules taking into account centre-of-mass motion and modified Steinvedel-Jensen (SJ) model. The calculated results are compared with electron scattering form factors and model-independent (in case of ^{16}O) TCD. The SJ model is in good agreement with the experimental TCD. The reduced dipole resonance transitions with T=0 are rather negligible ($\sim 10^{-3}$ e^2Fm^2) and transition radii are twice as great as root-mean-squared values. 4 refs.; 1 tab.

Relativistic electron wave functions are calculated taking into account the exchange including that with atomic electrons when calculating continuous spectrum wave functions, ICC are calculated for low energy (from 75eV to 2keV) transitions for which the dependence on the method of screening account is especially high. It is found that exchange account turing calculations of continuous spectrum wave functions changes ICC from 30% (the lowest energies) to 7-10% (transition energies close to 2 keV). The comparison of conversion ratios on the subshells with the experiment produces no opportunity now to check up whether the calculations have approached the experimental values due to high measurement error. 13 refs.; 3 tabs.

Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Corrections to the probability of retarded nuclear electromagnetic transitions conditioned by the excitation of the electron shell of the atom (inelastic electron bridge) are considered. The relation of the probability of transition across the inelastic bridge to the probability

of direct nuclear γ-transition is determined. Numeric estimates are made for the M4 transition in ^{93}Nb and ^{193}Ir nuclei. It is shown that the obtained estimates of the relative probability of γ-transition across the inelastic electron bridge agree well with the experimental values for ^{93}Nb and ^{193}Ir. 11 refs.

43977 (INIS-SU–100, pp. 76-81) **Hyperfine shifts of the X-ray levels, excited by internal conversion and subsequent electromagnetic cascade.** Rodionov, A.A. (AN SSSR, Leningrad (USSR). Inst. Yadernoj Fiziki); Fedorov, V.V. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

Nonstatistical, unlike the case of photoexcitation, population of components of the superfine structure of the edge atom K-level is possible in the case of resolved K-capture and internal K-conversion. The X-ray K-line appearing in this case is shifted relative to the fluorescent line, the measurement of such shifts opens new possibilities as regards the determination of nuclear components. The pesent paper presents the theory of effect of superfine shift of X-ray X_1,X_2-lines excited during internal conversion on the arbitrary atom shell and its flollowing discharge by the electromagnetic cascade. 13 refs.

43978 (INIS-SU–100, pp. 54-56) **Ionization, associated with internal conversion.** Drukarev, E.G. (AN SSSR, Leningrad (USSR). Inst. Yadernoj Fiziki); Trzhaskovskaya, M.B. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

When researching ^{125}Sb decay Mazets E,P noted that the energies of 6 ^{125}Te levels of 8 measured with the precision $<10^{-4}$ are multiple energies of the first excited state. This paper shows that the analogous picture is observed for a number of other odd Te,I,Xe,Cs nuclei whose level energies are determined with a rather high accuracy. The data for the levels with the energy <1000 keV are considered. The quantum value is connected with the first level energy and lies in the range 25-40 keV. 3 refs.; 3 figs.; 1 tab.

43980 (INIS-SU–100, pp. 118-120) **Two-nucleon correlations, refinement of the mechanism of pion-nuclear reactions.** Lantsev, I.A. (Novgorodskij Politekhnicheskij Inst., Novgorod (USSR)); Lysenko, I.V.; Ostroumov, V.I.; Pavlov, A.V. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

To clarify the problem of the differences in n,p distribution in nuclei and the establishment of mechanisms of pion interaction with two-nucleon correlations it is necessary to specify the ratio of yields of two fast protons, a neutron and a proton. The modern state of the problem is considered. The results obtained by the authors are analyzed. 4 refs.; 1 tab.

43981 (INIS-SU–100, pp. 146-151) **Realization of the gamma-resonance of natural width in the non-Moessbauer energy and temperature region.** Vysotskij, V.I. (Kievskij Gosudarstvennyj Univ., Kiev (Ukrainian SSR)); Kuz'min, R.N. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The possibility of a very sharp increase of resonance unenxpanded gamma-line probability (amplitude) in the range of high energies and temperatures due to the consequent account of nonlinear dynamics of the crystal lattice during intensive ultrasound excitation in a crystal is suggested and calculated. The estimates prove that using feasable ultrasonic crystal excitation at the frequency $\Omega\sim$10-100 MHz$<$H/h with the relative amplitude $\sigma\sim10^{-3}$ the increase in the probability of realization of natural gamma-resonance in the energy range E$>$300-400 keV by 100 and more times without line splitting and expansion as compared with the case of the conventional Moessbauer effect i.e. its increase from the $f<10^{-4}$ value (not permitting such a resonance) to the value $f^* \geq 10^{-2}$ permitting the realization of gamma resonance, for example, in the ^{149}Sm nucleus with E$\sim$350 keV, is possible. 6 refs.; 1 fig.

43982 (INIS-SU–100, pp. 108-114) **Characteristic of the deformed nuclei beta- and gamma bands.** Grigor'ev, E.P. (Leningradskij Gosudarstvennyj Univ., Leningrad (USSR)). AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The energies of rotational levels in γ-bands and E2 transition probabilities in ^{156,162}Dy, ^{152}Sm, ^{164}Gd, ^{158,164,166}Er, ^{166,170}Yb nuclei are analyzed. The cases of closely located levels with similar spins and parities and their mutual effect are noted. It is shown that the knowledge of precise energy values permits to predict the position of levels in a band. 4 refs; 3 figs.; 1 tab.

43983 (INIS-SU–100, pp. 115-117) **Peculiarities of the octupole bands in thorium nuclei.** Grigor'ev, E.P. (Leningradskij Gosudarstvennyj Univ., Leningrad (USSR)); Gomes Saunders, M. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The levels of "long" bands in even-even thorium isotopes were excited. The energy decrease of the first excited levels and nucleus deformation increase with the growth of neutron number was established. The bands with negative parity in a number of heavy elements are located very low. This brings about the assumption on the static octupole deformation of such nuclei. Rotation (or quasirotation) levels in thorium isotopes are considered. It has shown that the inversion of 0^- and 1^- levels takes place. 1 ref.; 2 tabs.

43984 (INP–1302/PS, pp. 47-72) **Shape and electric-quadrupole moments at high-spin states.** Hamamoto, I. (Lund Inst. of Tech. (Sweden). Dept. of Mathematical Physics). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89012206/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

Electric quadrupole matrix-elements of rotating nuclei are investigated in connection with the possible triaxial shape at high spin. It is shown that the signature dependence of the $\Delta I=1$ E2 transition rates in odd-A nuclei indicates the deviation of nuclear shape from axial-symmetry. Comments are made on the importance of taking into account of the wobbling motion in the analysis of measured quadrupole matrix-elements, especially for small angular-momentum and for small γ-values. 26 refs., 9 figs. (author).

43985 (INP–1302/PS, pp. 142-163) **Test of nuclear models with neutron-rich nuclei.** Sistemich, K. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The spectroscopy of fission products provides unique possibilities to test several nuclear models. Thus one of the rare doubly magic nuclei, $_{50}{}^{132}Sn_{82}$, belongs to the neutron-rich isotopes and its study allows the test of the shell model at medium masses and far from stability. The nuclei at A $\sim$ 100 are influenced by subshells and deformation-driving forces. A rapid transition from spherical to deformed shapes can be studied. In this report some investigations are discussed which were performed at the fission-product separator JOSEF, or where members of the JOSEF group have contributed. Evidence has been obtained for strong shell closures at ^{132}Sn. In the A $\sim$ 100 region it was found that high-lying levels in ^{97}Y have single-particle character while ^{99}Y exhibits all properties of a symmetric rotor. This is of special interest since both the experimental knowledge on even-even nuclei and theoretical predictions indicate complex structures (e.g. shape coexistence and asymmetries) as well as softness against deformation for the immediate neighbours. 58 refs., 11 figs., 1 tab. (author).

43986 (INP–1302/PS, pp. 218-235) **New regions of nuclear deformation.** Lister, C.J. (Manchester Univ. (UK). Dept. of Physics); Varley, B.J. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

It has long been expected from general theoretical considerations that nuclei with Z and N far removed from major shell closures should exhibit considerable collectivity and may be deformed in their groundstates. A number of calculations have recently attempted to quantify these expectations through detailed predictions of nuclear shapes across the periodic table. In this contribution we review predictions and experimental data for the regions with (Z,N)$\sim$(40,40) and (64,64) which are well off the valley of stability. Emphasis is placed on new results from the light rare earth region where evidence for axially symmetric nuclei with E>0.3 has been found. 24 refs., 9 figs., 2 tabs. (author).

43987 (INP–1302/PS, pp. 278-280) **Scission-point model of nuclear fission.** Moreau, J. (Ghent Rijksuniversiteit (Belgium). Lab. voor Kernfysica); Heyde, K.; Waroquier, M.; Isacker, P. van; Jolie, J.; Ryckebusch, J. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

Experimental data and calculated values for the mass distribution in the fission of ^{235}U is compared. Various discrepancies between theoretical calculations and experimental results on mass and kinetic energy distributions indicate that the collective kinetic energy at the scission point is certainly not independent of the various collective degrees of freedom. In order to obtain the precise relation, the dynamic aspects of the fission process and associated intrinsic excitation energy is studied. 5 refs., 2 figs. (L.I.).

43988 (INP–1302/PS, pp. 324-328) **Residual neutron-proton interaction in rotating odd-odd rare earth nuclei.** Frisk, H. (Lund Inst. of Tech. (Sweden). Dept. of Building Technology). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The GM-splitting and the Newby-shift are calculated. A few examples where several spin states have been observed in both members of the Gallagher-Moszkowski doublet are compared and illustration of possible effects caused by the residual interaction calculated. Two quasiparticle Routhians of two different $[h_{11}2/]_p[i_{13}2/]_n$ configurations are shortly described. 8 refs., 3 figs. (L.I.).

43989 (INP–1302/PS, pp. 331-345) **Superdeformation of fast rotating nuclei.** Blocki, J. (Institute for Nuclear Studies, Otwock-Swierk (Poland)). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

Calculation within Liquid Drop Model (LDM) leading to the stable superdeformed shapes of light nuclei are shown. Possible ways of deexcitation of these nuclei formed in Heavy Ion Collisions are discussed. In addition calculations using folding potential and their comparison with a LDM idealization are also presented. 15 refs., 5 figs., 1 tab. (author).

43990 (INP–1302/PS, pp. 356-361) **Study of the σtau$_+$ strength in ^{148}Tb in the framework of the Quasiparticle-Random-Phase Approximation (QRPA).** Conci, C. (Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik). Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The σtau$_+$ strength in the nucleus ^{148}Tb using the Quasiparticle-Random-Phase Approximation is studied. It is investigated how and how much conventional nuclear structure effects , like pairing effect and ground state correlations can account for the missing GT$^+$ strength. 7 refs., 1 fig. (author).

43991 (INP–1302/PS, pp. 398-412) **Nuclear collective motion within the generator coordinate method.** Gozdz, A. (Regensburg Univ. (Germany, F.R.). Naturwissenschaftliche Fakultaet 2 - Physik); Pomorski, K.; Brack, M.; Werner, E. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The generator coordinate method (GCM) and the Gaussian approximation for the overlap (GOA) of generating functions are used to multidimensional collective vibrations. The proper collective Schroedinger equation is derived, starting from a mean field potential depending on some collective parameters and including a residual pairing interaction. The mass parameters for the shape vibrations estimated in the cranking and in the GCM approximations are compared. It is also shown that within GCM + GOA method it is relatively simple to restore the broken symmetries, e.g. the approximate projection for good particle number and angular momentum of the BCS vawe function. 15 refs., 7 figs. (M.F.W.).

43992 (INP–1302/PS, pp. 394-397) **Spontaneous fission half-life-times for double-odd actinide nuclei.** Lojewski, Z. (Uniwersytet Marii Curie-Sklodowskiej, Lublin (Poland). Inst. Fizyki); Baran, A. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

A hidrance factor H is calculated for actinide nuclei (A≥242). Spontaneous fission half-life times for double odd actinide nuclei are shown. The calculated results are compared with experimental data. 4 refs., 6 figs. (M.F.W.).

43993 (INP–1302/PS, pp. 417-423) **On the interpretation of monopole interacting Boson Model (IBM) bosons in terms of the collective pairing field.** Szpikowski, S. (Uniwersytet Marii Curie-Sklodowskiej, Lublin (Poland). Inst. Fizyki); Zajac, K. Institute of Nuclear Physics, Cracow (Poland). 1985. (CONF-8504342–: 20. winter school on physics, Zakopane (Poland), 13-26 Apr 1985). In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

It has been already recognized that the quadrupol bosons (d-bosons) are connected to the quadrupol phonons of the collective nuclear model of Bohr and Mottelson. The scalar s-bosons, on the other hand, seem to be the building blocks for description of the microscopic pairing interaction. The seminar is devoted to show, in an explicite way, such a connection. 12 refs., 1 fig. (author).

43994 (ITP–87-156) **Vertex constant of T->d+n in a two-body potential approach.** Petrov, N.M. AN Ukrainskoj SSR, Kiev (Ukrainian SSR). Inst. Teoreticheskoj Fiziki. 1988. 8p. Order Number DE89634637/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

The nuclear vertex constant G^2_{Tdn} is calculated within the two-body potential theory. To describe the nd-interaction the use is made of the Hulten potential whose parameters are consistent with triton binding energy E_T and doublet nd-scattering length A_2 corresponding to different nucleon-nucleon potentials. For the majority of NN-potentials a good quantitative agreement of the value G^2_{Tdn} calculated in a two-body potential model with the same value found from the solution of exact three-particle equations is obtained. The values of the vertex constant G^2_{Tdn} and the asymptotic parameter G^2_T corresponding to experimental triton binding energy and the doublet nd-scattering length are defined. 23 refs.; 1 tab.

43995 (JINR-N–6(32)-88, pp. 17-21) **Nuclear structure functions in the boundary region of the single-particle kinematics.** Kaptar', L.P.; Umnikov, A.Yu. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012205/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; INIS.

A theoretical analysis of nuclear functions in the region x~1 is given. It is shown that the contributions of pure nucleons and multiquak components of the nuclear wave function in this region are comparable and the binding effects and Q^2-evolution lead to softening of the quark distributions in nucleus. Numerical predictions for the carbon structure function in the cumulative region were made. 9 refs,; 2 figs.

43996 (JINR-N–6(32)-88, pp. 11-16) **Space-time picture of deep inelastic lepton-nucleus collisions.** Eliseev, S.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics); Kamal, M.; El-Naghy, A. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. (In Russian). In *JINR rapid communications. Collection of papers.* Order Number DE89012205/JAW. Available from NTIS (US Sales Only), PC A03/MF A01; INIS.

Space-time characteristics of inelastic intranuclear interactions are determined by analysing νE_m collisions at high energies. Particular attention is given to the new data obtained at the hybrid emulsion spectrometer earlier used for studying the production cross sections and lifetimes of charmed particles. 8 refs.; 6 figs.

43997 (JINR-R–4-88-539) **Static deformation of atomic nuclei and giant quadrupole resonance.** Bal'butsev, E.B.; Molodtsova, I.V. Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics. 1988. 10p. (In Russian). Order Number DE89634622/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Submitted to the journal Yad. Fiz.

The energies and probabilities B(E2)-factors of giant quadrupole resonances (GQR) in dependence on deformation are calculated in the framework of the method of moments. Splitting of GQR energy obtained here is in good agreement with the experimental values of broadening of CQR. The leading role of operator of kinetic energy in originating of static deformation of atomic nuclei is demonstrated. 11 refs.; 2 figs.; 1 tab.; submitted to the journal Yad. Fiz.

43998 (Juel-Spez–486) **Elastic K^+-nucleus scattering with a microscopical K^+-nucleon t-matrix.** Wyborny, P. Kernforschungsanlage Juelich G.m.b.H. (Germany, F.R.). Inst. fuer Kernphysik. Dec 1988. 118p. (In German). Order Number DE89796018/JAW. Available from NTIS (US Sales Only), PC A06/MF A01.

The elastic scattering of K^+-mesons from nuclei is studied to access the possibility of a hadronic scale change in nuclear matter. The K^+-meson is the appropriate probe for such studies because of its large mean free path of $\simeq$ 7 fm in nuclei. The total and the elastic differential cross sections are calculated for the reactions K^+-deuteron, K^+-^{12}C and K^+-^{40}Ca at various incident energies (450 MeV/c $\leq p_{lab} \leq$ 800 MeV/c) using an optical potential which was constructed in lowest order multiple scattering theory (t_ρ-factorisation in momentum space). The density p was taken from electron-scattering experiments corrected for the finit size of the proton. The (K^+-N) t-matrix was constructed by Buettgen and Holinde. The off-shell behavior of the microscopic K^+-N t-matrix is examined. Using this microscopic K^+-N t-matrix in the construction of the K^+-nucleus optical potential we get an excellent description of total and elastic differential cross sections for deuteron, ^{12}C and ^{40}Ca. We also obtain a good description of the measured ratio $\sigma^{K\pm 12c}$ total / $\sigma^{K\pm deuteron}$ total over a wide incident energy range. The reason for this good aggreement is due to a different interference pattern of the scattering phase shifts using experimental phase shifts or phase shifts calculated from microscopic meson exchange model. (orig.).

43999 (Lund-MPh–88/14) **An approximate method for calculating the deformation of rotating nuclei.** Lind, P. Lund Univ. (Sweden). Dept. of Mathematical Physics. 7 Nov 1988. 55p. Order Number DE89796487/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

The author presents as a collective model where the potential surface at spin I=0 is calculated in the Nilsson-Strutinsky model, an analytical expression for the moment of inertia is used which depends on the deformation and the pairing gaps for protons and neutrons, and the energy is minimized with respect to these gaps. Calculations in this model are performed for ^{16}Oyb. (HSI).

44000 (RCNP-P–100) **Report of study meeting on giant resonance.** Osaka Univ., Ibaraki (Japan). Research Center for Nuclear Physics. 1988. 234p. (In Japanese). Order Number DE89906614/JAW. Available from NTIS (US Sales Only), PC A11/MF A01.

The research on the giant resonance of atomic nuclei taking the opportunity of the discovery of E2 giant resonance about 15 years ago has developed to the discovery of E0, E3 and E4 giant resonances, GT and MI resonances and others. The recent development seems to proceed toward the more basic understanding of the oscillation mode of atomic nuclei themselves through the research on giant resonance carried out so far. Taking the opportunity of the discovery of GT and MI resonances and others, the role of Δ nucleons in atomic nuclei has been actively discussed, and this is one of the good examples. In order to understand more comprehensively the behavior of nucleons in atomic nuclei and the nuclear force acting mutually on nucleons, it is effective to study on respective excitation modes after separating the response spectra of atomic nuclei into spin, isospin and exciting angular momentum. It is important also to search for a new excitation mode of atomic nuclei. In order to put the present status in order and to discuss the new direction of development about the giant resonance of atomic nuclei, the study meeting 'Giant resonance' was held on June 21 - 23, 1988 in the Nuclear Physics Research Center, Osaka University. In this report, the discussions and reports at the meeting are collected. (K.I.).

44001 **Predictions of $B(E2; 0^+_1 \rightarrow 2^+_1)$ values for even-even nuclei.** Raman, S. (Oak Ridge National Laboratory, Oak Ridge, Tennessee 37831 (US)); Nestor, C. W. Jr.; Kahane, S.; Bhatt, K. H. *Atomic Data and Nuclear Data Tables (USA)*, 42(1): 1-54 (May 1989). DOE Contract AC05-84OR21400;AS05-76ER04936.

Adopted values (from a previous compilation) for the energy, *E*, and the reduced electric quadrupole transition probability, *B*(*E*2)↑, for the first-excited 2^+ state of 276 even-even nuclei are tabulated. The adopted *B*(*E*2)↑ values are employed to test the various systematic, empirical, and theoretical relationships that have been proposed to exist among these *B*(*E*2)↑ values on a global, local, or regional basis. On the basis of these systematics, predictions of unmeasured *B*(*E*2)↑ values for 181 additional nuclei are made in the tabulation. © 1989 Academic Press, Inc.

44002 (AD-A–206209/9/XAB) **Stopping powers and mean excitation energies of the transition metals from iron to zinc.** Sabin, J.R. Florida Univ., Gainesville, FL (USA). Quantum Theory Project. 1 Feb 1989. 9p. Available from NTIS, PC A02/MF A01.

Pub. in Physical Review A, Vol. 39, No. 3, 1033-1040(1 Feb 1989).

The Z 2-1 dependent (Bethe) stopping powers of metallic Fe, Co, Ni, Cu, and Zn targets for protons in the energy range 2 keV < Ep< 100 MeV are calculated using the kinetic theory of stopping. The necessary electron velocity distributions are obtained from measured solid-state Compton profiles. The mean excitation energies are obtained by matching the calculated stopping curves to experimental data in the projectile energy range 1 MeV < Ep < 30 MeV, a range where the projectile velocity is too large for deviations from Bethe stopping to be important, and too small for relativistic corrections to be unimportant. The results obtained in this manner yield stopping curves that agree quantitatively with experimental measurements in the whole projectile energy region where Bethe theory should be valid, and which behave in the expected manner outside this region. It is demonstrate that the decomposition of the mean excitation energy into orbital contributions is important for determination of the stopping cross section. We conclude that assigning different orbital mean excitation energies to different shells leads to rather large modifications of the commonly accepted total mean excitation energy.

44003 (AECL–9185) **Analysis of neutron small angle scattering data for molecules of arbitrary shape.** Ahmed, F.U.; Martel, P. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Oct 1986. 28p. Order Number DE89634618/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The spherical modification of the Debye method proposed by Glatter has been programmed to analyze small angle neutron scattering (SANS) data in terms of various complicated molecular shapes. In the calculational procedure the molecule is simulated by a large number of overlapping small spheres which fill the space occupied by the molecule. A technique is described for fitting the resolution-broadened model scattering function to experiment by varying selected model parameters and normalization factors so as to obtain the best fit (minimum chi^2). At each stage of iterative procedure the radius of gyration is computed. When the model shape can be represented by a combination of simple analytic forms the program itself defines the coordinates and radii of the small spheres and automatically minimizes boundary effects. If this representation cannot be made then the user must specify the coordinates and radii of the small spheres as well as their number lying within the specified boundaries of the model shape. This report gives a description of the program (COBRA) and directions for its use.

Dept. of Physics. 27 Jul 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76ER03342. Order Number DE89016660/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A search for a novel coupling interaction between the Pendelloesung periodicity which is formed in a diffracting crystal and the Larmor precession of neutrons in a magnetic field has been carried out. This interaction is expected to exhibit a resonant behavior when the two spatial periodicities become matched upon scanning the magnetic field being applied to the crystal. Observations on a diffracting, perfect crystal of silicon with neutrons of wavelength 1 Angstrom show the expected resonant action but some discrepancy between the observed magnitude of the resonance effects remains for interpretation. 16 refs.

A benchmark experiment proposal.** Batistoni, P.; Bertalot, L.; Martone, M.; Pillon, M. ENEA, Rome (Italy). May 1985. 28p. Order Number DE89761998/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Contribution of ENEA to the European Fusion Technology Program Task B3 (Neutronics Benchmark Experiment), Frascati (Italy) 13-15 Dec 1984.

The shielding problem for a fusion reactor could, in principle, be similar to the fission reactor problem solved thirty years ago. Nevertheless, the large difference in the energy of neutrons (14 MeV for fusion, about 1 MeV for fission) requires, in connection with the shield design for a fusion reactor, improvement in the present calculation methods and key experiments in order to gain confidence in these calculations. This report presents the proposal of a neutron streaming experiment, to be used as a benchmark to test neutron code calculation. As measured by R.T. Santoro, neutron and gamma-ray energy spectra, resulting from the streaming of 14 MeV neutrons through a 0.3 m/diameter iron duct, are compared with spectra calculated by the use of 3-D Monte Carlo MORSE and MCNP codes.

44010 (JAERI–1316) **RADHEAT-V4: a code system to generate multigroup constants and analyze radiation transport for shielding safety evaluation.** Yamano, Naoki; Minami, Kazuyoshi; Koyama, Kinji; Naito, Yoshitaka. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1989. 315p. Order Number DE89906496/JAW. Available from NTIS (US Sales Only), PC A14/MF A01.

A modular code system RADHEAT-V4 has been developed for performing precisely neutron and photon transport analyses, and shielding safety evaluations. The system consists of the functional modules for producing coupled multi-group neutron and photon cross section sets, for analyzing the neutron and photon transport, and for calculating the atom displacement and the energy deposition due to radiations in nuclear reactor or shielding material. A precise method named Direct Angular Representation (DAR) has been developed for eliminating an error associated with the method of the finite Legendre expansion in evaluating angular distributions of cross sections and radiation fluxes. The DAR method implemented in the code system has been described in detail. To evaluate the accuracy and applicability of the code system, some test calculations on strong anisotropy problems have been performed. From the results, it has been concluded that RADHEAT-V4 is successfully applicable to evaluating shielding problems accurately for fission and fusion reactors and radiation sources. The method employed in the code system is very effective in eliminating negative values and oscillations of angular fluxes in a medium having an anisotropic source or strong streaming. Definitions of the input data required in various options of the code system and the sample problems are also presented. (author).

Neutron scattering gives direct information about properties of condensed matter that can be obtained in no other way. At this time and for the foreseeable future, the best neutron scattering facilities are in Europe. The best reactor source is at the ILL, while ISIS, the best pulsed source, is at RAL. The reactor source is more versatile, but the pulsed source can be superior in specialized cases. This report contains an account of our studies on magnetism and superconductivity at the ILL and measurements to be made on the excitation spectra of iron at ISIS. At the ILL, we concentrated on the heavy fermion system UBe_{13}, but we also made measurements on the high-temperature superconductors. We were particularly interested in magnetic effects in the new electron-doped materials like $Pr_2(Ce)CuO_4$. The ISIS burned out a magnet and was not running at the time I was there, but we got the experiment set up, and it will be run as soon as the machine starts. We also made plans to do an experiment utilizing the muon precession apparatus (mSR) on the one-layer 2201 BiSrCuO superconductor.

44013 (PB–89-188809/XAB) **DCTDOS: neutron and gamma penetration in composite duct systems.** Spencer, L.V. National Bureau of Standards, Washington, DC (USA). Center for Radiation Research. Feb 1987. 93p. (NBSIR–87/3534). Available from NTIS, PC A05/MF A01.

The paper describes computer methods for estimating neutron and gamma-ray fluence rate, dose, and even spectral features due to penetration through a series of duct segments. The procedure links together data for individual segments – straight sections and bends – in arbitrary combinations; and the resulting composite can include computations for a room at the end, if there is one. This particular method was developed for rapid estimates in the protection problems against nuclear weapons, but the concepts employed are more broadly applicable.

44014 (PNL–6500-Pt.4, pp. 25-27) **Doubly differential ionization cross section for the intermediate-velocity heavy ions.** Toburen, L.H.; DuBois, R.D.; Goldhagen, P. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

For a complete description of the energy deposition by fast neutrons in tissue, one must understand the interaction process for charged-particle recoils including hydrogen, helium, carbon, oxygen and nitrogen ions. Although our primary emphasis has been on hydrogen and helium ions, the predominant particles induced by neutron reactions in tissue, we have also initiated measurements for carbon and oxygen ions. During the past year, analysis of data of the doubly differential cross sections for interaction of oxygen ions with water vapor molecules has continued. The data for ion energies from 1.3 to 3.3 MeV and charge states 1 to 3 enable a detailed study of the charge state dependents on electron emission cross sections. Cross sections are available for electron emission angles ranging from 15 to 130 degrees and ejected energies from a few eV to 1500 eV.

44015 (PNL–6500-Pt.4, pp. 29) **Ionization in small sites.** Wilson, W.E.; Metting, N.F.; Paretzke, H.G. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Our treatment of the ionization and energy deposition in submicron sites produced by crossing protons was significantly reworked. A theoretical basis for the major part of the dependence on ion energy and site size was developed. Also, an analytical solution to an equation was discovered which obviated a requirement for a numerical solution. These improvements resulted in a more sound and concise algorithm for describing the distributions.

44016 (PNL–6500-Pt.4, pp. 29-30) **Microdosimetric aspects of 0.3- to 20-MeV proton tracks, I. crossers[a].** Wilson, W.E.; Metting, N.F.; Paretzke, H.G. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Track structures of fast protons obtained by computer simulation using a detailed-history Monte Carlo method were evaluated to obtain stochastic frequency distributions for energy imparted and number of ionizations. These microdosimetric quantities were calculated for 0.3- to 20-MeV protons passing through spherical sites of 2 nm to 1 μm diameter in unit density water. From the distributions, the dependencies of their first two moments on ion energy, site size, and position of the track within the site were computed. The frequency distributions were fitted by simple analytical functions to fitted by simple analytical functions to facilitate their use in further microdosimetric considerations.

44017 (PNL–6500-Pt.4, pp. 30) **Analytic model for ionization distributions produced in nanometer volumes by recoil protons[a].** Wilson, W.E.; Paretzke, H.G. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

A concise mathematical model is presented for the microdosimetric ionization distributions produced in subcellular volumes by energetic protons of 0.3 to 20 MeV. The model is based on the results of extensive Monte Carlo computer simulations of high-LET charged particle tracks and can be used to estimate, with only a modest computing effort, straggling and delta-ray transport effects in the nanometer dosimetry of high-LET radiations.

44018 (PNL–6500-Pt.4, pp. 30) **Microdosimetric aspects of 0.3- to 20-MeV proton tracks. II. Touchers.** Wilson, W.E.; Paretzke, H.G. Pacific Northwest Lab., Richland, WA (USA). Jun 1988. In *Pacific Northwest Laboratory Annual Report for 1987 to the DOE Office of Energy Research: Part 4, Physical Sciences.* Order Number DE88014094/JAW. Available from NTIS, PC A05/MF A01.

Protons that pass outside the site but which deposit energy via secondary electrons, so-called touchers, are significant events for very small sites inasmuch as nearly 50% of the stopping power is borne by delta-rays. Toucher-event modeling has focused on trying to discover the systematics of the ionization distributions. The probability for a nanometer site experiencing any ionization deposition was proportional to the solid angle of the site as seen from the ion path, and to the total ionization cross section, i.e., proportional to the number of delta-rays produced per unit path length. The data was scaled by the real trigonometric solid angle for near distances, various effective eccentricities were tried, and partial cross sections were used that realistically reflected the production of only those delta-rays capable of reaching the site. Some of the variations were helpful over small regions of the parameters, ion energy for example. But none, alone or collectively, produced universal simplicity or insight into the problem. The set of computed ionization distributions was inadequate for the task.

44019 A neutronic study of an accelerator-based neutron irradiation facility for boron neutron capture therapy. Wang, C.K.C. (9521095); Blue, T.E.; Gahbauer, R. *Nuclear Technology (USA),* 84(1): 93-107 (Jan 1989).

A neutronic study of an accelerator-based neutron irradiation facility (ANIF) for boron neutron capture therapy (BNCT) was performed using three-dimensional Monte Carlo transport calculations. The major components of the ANIF are a radio-frequency quadrupole proton accelerator, a ^{7}Li target, and a moderator assembly. Neutrons are generated by bombarding the ^{7}Li target with 2.5-MeV protons. The neutrons emerging from the ^{7}Li target are too energetic to be used for BNCT and must therefore be moderated. Calculations show that, among all materials for the ANIF, beryllia (BeO) and heavy water (D_2O) are the best moderators. Between them, beryllia provides better neutron spectra, but D_2O gives higher neutron intensities. Adding alumina (Al_2O_3) to D_2O improves the neutron spectra, but it also increases gamma-ray contamination.

44020 Fine-mesh limit of one-dimensional nodal transport equations. Gelbard, E.M. (9520850); Liu, Y.W.H.; Olvey, L. *Nuclear Science and Engineering (USA),* 101(2): 166-178 (Feb 1989).

Embedded in multidimensional nodal transport computations is the solution of transverse-integrated one-dimensional transport equations. Since, in these embedded one-dimensional computations, fluxes on boundaries are double P_1 DP_1, it is generally assumed that the one-dimensional solutions, in the small-mesh limit approach DP_1 solutions. It is shown that this is not necessarily true. Small-mesh limits of nodal equations are derived, and it is shown that these are substantially worse than the DP_1 equations under certain circumstances. Alternative nodal equations (which do have a DP_1 small-mesh limit) are proposed.

44021 (CANMET–84-11E) **Lead-210 in certified uranium reference ores DL-1a, BL-4a, DH-1a and BL-5.** Smith, C.W.; Steger, H.F. Canada Centre for Mineral and Energy Technology, Ottawa, ON (Canada). Mining Research Labs. Dec 1984. 27p. Order Number DE89635402/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Lead-210 radioactivity in uranium reference ores BL-4a and BL-5 and uranium-thorium reference ores DL-1a and DH-1a was determined by an interlaboratory program. Ten of eleven participating laboratories employed Amersham Corporation certified ^{210}Pb solutions for calibration for measurements by gamma-ray spectrometry, beta-counting of ^{210}Bi or alpha spectrometry of ^{210}Po following radiochemical separations. No significant methodological bias was detected. Recommended values for ^{210}Pb activities and associated parameters were determined by statistical treatment of the results. The recommended values for the activity of ^{210}Pb are 1.40, 15.5, 30.8 and 866 Bq g^{-1} for DL-1a, BL-4a, DH-1a and BL-5, respectively. These values are consistent with secular equilibrium in the ^{238}U decay series in each material.

44022 (GSF–3/89) **Tomographic anthropomorphic models. Pt. 1. Construction technique and description of models of an 8 week old baby and a 7 year old child.** Veit, R.; Zankl, M.; Petoussi, N.; Mannweiler, E.; Drexler, G.; Williams, G. Gesellschaft fuer Strahlen- und Umweltforschung m.b.H. Muenchen, Neuherberg (Germany, F.R.). 1989. 58p. Contract EG B16-F-133-D. Order Number DE89911154/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

The first generation of heterogeneoeous anthropomorphic mathematical models to be used in dose calculations was the MIRD-5 adult phantom, followed by the pediatric MIRD-type phantoms and by the GSF sex-specific phantoms ADAM and EVA. A new generation of realistic anthropomorphic models is now introduced. The organs and tissues of these models consist of a well defined number of volume elements (voxels), derived from computer tomographic (CT) data; consequently, these models were named voxel or tomographic models. So far two voxel models of real patients are available: one of an 8 week old baby and of a 7 year old child. For simplicity, the model of the baby will be referred to as BABY and that of the child as CHILD. In chapter 1 a brief literature review is given on the existing mathematical models and their applications. The reasons that lead to the construction of the new CT models is discussed. In chapter 2 the technique is described which allows to convert any physical object into computer files to be used for dose calculations. The technique which produces three dimensional reconstructions of high resolution is discussed. In chapter 3 the main characteristics of the models of the baby and child are given. Tables of organ masses and volumes are presented together with three dimensional images of some organs and tissues. A special mention is given to the assessment of bone marrow distribution. Chapter 4 gives a short description of the Monte Carlo code used in conjunction with the models to calculate organ and tissue doses resulting from photon exposures. Some technical details concerning the computer files which describe the models are also given. (orig./HP).

44023 (IAE–4528/3) **Risk and safety discussed from system dynamics point of view.** Kuz'min, I.I.; Romanov, S.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1987. 28p. (In Russian). (T–18888). Order Number DE89635277/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

One of possible approaches to solution of the problem of optimizing espenditure for population protection is presented. The most general indeces of public health the total mortality coefficient and mean life time from burth-were used as the measure of safety. Technique, based on methods of system dynamics, quantitative estimation of technogenic risk and calculation of the maximal efficiency of expenditure for technical safety systems, is presented. 16 refs.; 8 figs.

44024 (INFO–0266) **'Alive' searches as complementing death searches in the epidemiological follow-up of Ontario miners.** Fair, M.E.; Newcombe, H.B.; Lalonde, P.; Poliquin, C. Atomic Energy Control Board, Ottawa, ON (Canada). Feb 1988. 47p. Order Number DE89635278/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

'Alive' searches have been used to complement the 'death' searches, in a study of the mortality experience of a cohort of Ontario miners. The purpose has been to develop a way of distinguishing between those cohort members who are 'confirmed' alive at a given time, and those who are 'lost to follow-up'. A total of 30,000 Workers' Compensation Board (WCB) records with valid Social Insurance Numbers (SIN) were used to search the income tax files by computer over two consecutive years (1977 and 1978) representing nearly 27 million tax returns. These tax file searches using SIN numbers have provided information on the procedures to be used in, and likely success of, the corresponding searches of the tax files that could be carried out where the SIN number is not available on the work records. The latter kind of search would have to be based on names, birth dates and such, and would be probabilistic in nature. The results of the study were as follows: After the

initial death search, it was found that 7.5% of the cohort had died in Canada and their records were found on the Mortality Data Base. The remaining 92.5% has been 'assumed alive' in the earlier analysis. After the 'alive' follow-up using the income tax file, one was able to confirm that 89.1% of the 'assumed alive' had filed an income tax after the study period. Thus only 3.4% of the cohort remained untraced. Among those there could be an admixture of deaths outside of Canada, persons who have moved outside of Canada and are still alive, and/or persons alive within Canada, but who have not filed an income tax return. This study has indicated that the procedures developed are useful for purposes of 'alive' follow-up, for evaluation of the quality of the Mortality Data Base-cohort death file searches, for improving the accuracy of analytical results of epidemiological studies, and for reducing the cost and labour of resolving doubtful death searches.

44025 (INFO–0269) **Morbidity follow-up feasibility study.** Carpenter, M. Atomic Energy Control Board, Ottawa, ON (Canada). Feb 1988. 38p. Order Number DE89635279/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The report reviews the available sources of data within Canada for undertaking morbidity follow-up studies to both supplement and complement studies using Canadian mortality data. Such studies would permit earlier detection and more sensitive measures of differences in risk for exposures to radiation and allow timely measures to be taken to minimize any occupational and environmental health risk to radiation workers. The technical feasibility of using these sources was reviewed using the criteria of adequate personal identifying information, automation of data records, file size and the accuracy of the morbidity diagnosis information. At the present time certain of the provincial cancer registry files meet these criteria best. A work plan was prepared suggesting a morbidity pilot study to clarify the role of occupational factors in the incidence of cancer among radiation workers using the Alberta Cancer Registry file and the National Dose Registry (NDR) file of radiation workers. For the longer term a full cohort study using the National Cancer Incidence Reporting System (NCIRS) and the NDR workers as the study population would provide information on all radiation workers on a national basis. A work plan was prepared and some initial format conversion of historical data was undertaken to begin developing the NCIRS into a data base suitable for long-term health studies.

Ionizing radiation is used extensively in the field of scientific research. The risk of uncontrolled exposure to both the worker and the environment is ever present. The purpose of this Code is to set out practices considered by the CSIRO Health and Safety Committee to be appropriate for CSIRO staff and, if followed, they will result in appropriate protection for research staff and the environment. The Code does not cover sources of non-ionizing radiation such as microwave ovens, RF generators and laser sources.

In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

The method of restoring scintillation spectra for precise measurements of low rate exposure doses in a wide range of gamma-radiation energies, is described. The solution of the problem of separation of complex multiplets into separate spectral components (up to 30 in one multiplet) in the case of apriori information on their energy, is considered. The estimates of precision of problem solution depending on statistics, spectrometer resolution ability and the range of changes of component intensities in the spectrum are obtained. The effect of apriori information on the shape and parameters of the response function of equipment on the errors of component intensities is discussed. 5 refs.; 5 figs.

In this contribution the possibilities of the thermoluminiscence dosimetry method under the difficult conditions of total body irradiation at low dose rate are illustrated. (H.W.). 2 res.; 1 fig.

44039 (RERF-TR–10-88) **Salivary gland doses from dental radiographic exposures.** Hoshi, Masaharu; Kato, Kazuo; Wada, Takuro; Antoku, Shigetoshi; Russell, W.J. Radiation Effects Research Foundation, Hiroshima (Japan). Jan 1989. 9p. (In Japanese, English). Order Number DE89906460/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

Salivary gland doses incurred during dental radiography were measured by phantom dosimetry, and these dose data and data obtained during a two-week survey of Hiroshima and Nagasaki dental hospitals and clinics were used to estimate the respective doses to members of the populations of the two cities. The results obtained were used to supplement previously determined doses to the thyroid gland, lens, and pituitary gland from dental radiography. No significant differences in doses were observed by age, sex or city. Doses to the salivary glands during dental radiography are probably not sufficiently large to cause bias in assessments of atomic bomb survivors for late radiation effects. However, the steadily increasing use of dental radiography underscores the need for continued monitoring of dental radiography doses in the interests of these assessments. (author).

44040 **Beamline and irradiation chamber for dosimetry and biology studies using synchrotron radiation.** Meger, C. M. (Department of Medical Physics, University of Wisconsin-Madison, Madison, Wisconsin 53706 (US)); Pearson, D. W.; DeLuca, P. M., Jr.; Wells, G. M.; Cerrina, F.; Gould, M. N. *Review of Scientific Instruments (USA),* 60(7): 2235-2238 (Jul 1989).

Ultrasoft x rays are a useful probe for mechanistic studies of radiation damage in living cells. The highly localized energy deposition from a low energy x-ray occurs in a volume comparable to the sensitive biological targets within a cell, so that these low-energy x rays can be used as a tool to investigate radiation effects on the subcellular level. In the ultrasoft x-ray energy region the bright intensity and tunable energy selection of synchrotron radiation is unmatched by conventional sources. A beamline and irradiation chamber for dosimetry and radiation biology studies has been set up at the ES-0 exposure station of the Center for X-ray Lithography at Aladdin. The beamline includes a 10-μm-thick Be entrance window and a combination filter and single synthetically fabricated multilayer mirror for energy selection. The irradiation chamber contains another Mylar window for isolation, a two-dimensional scanning system allowing a 400-cm^2 exposure area with scanning rates up to 3.5 cm/s, a rotating feedthrough system that enables motion in the third dimension, several viewports and a specially designed cell sample holder which can be filled with gases at various pressures and holds up to 18 cell culture dishes. The system has been characterized with a gas flow proportional counter to determine energy bandpass and spectral purity and a calorimeter and ionization chamber to assess photon intensity at various energies within the range 500–2000 eV.

44041 **Data acquisition and beamline control software.** Brennan, S. (National Institute of Standards and Technology, Quantum Metrology Division, Gaithersburg, Maryland 20899 (US)); Cowan, P. L. *Review of Scientific Instruments (USA),* 60(7): 2253-2256 (Jul 1989).

A fortran program is described that runs on a 16-bit minicomputer under a single-user real-time operating system. This program combines interrupt-driven data collection, beamline positioning, and data analysis in a way that allows analysis of previously collected data while the program is collecting new data. It has been successfully used for several years on beamline X-24A at the National Synchrotron Light Source for fluorescence spectroscopy studies, surface extended x-ray absorption fine structure, and back-reflection standing-wave measurements.

Pub. in High Pressure Chemistry and Biochemistry, 193-235(1987).

This review covers various aspects of nuclear magnetic resonance spectroscopy and laser Raman and Rayleigh spectroscopy at high pressure. The presentation is organized into the following main sections: 1. Introduction; 2. Experimental High Pressure NMR Techniques; 3. Experimental High-Pressure Laser Scattering Techniques; 4. Applications of NMR at High Pressure; 5. Applications of Laser Raman Scattering at High Pressure. The main emphasis is on studies aimed towards improving our fundamental understanding of the dynamic structure of fluids but several examples dealing with disordered solids are also included.

Brief discussions are given in this progress report on the following topics: the 4f-quadrupolar moment of Yb in $YbCu_2Si_2$; thermodynamics of the n-channel Kondo problem in a magnetic field; the two-impurity Kondo problem; critical behavior of Heisenberg chains; spin-wave theory of the two-dimensional antiferromagnet with impurities; one-dimensional Hubbard model with attractive on-site U; the Gutzwiller dynamic susceptibility; and high-temperature superconductivity. (LSP)

44044 (DOE/ER/45376–1) **Dynamics of surface melting: Progress report, September 1, 1988–December 31, 1989.** Elsayed-Ali, H.E. Rochester Univ., NY (USA). Lab. for Laser Energetics. Jul 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-88ER45376. Order Number DE89016337/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The objectives of this program is to study the phenomena of surface melting of single crystals of metals, to test for its existence, and to investigate its dynamics using picosecond reflection high-energy electron diffraction (RHEED). In this year, the UHV facility containing picosecond RHEED has become fully operational with a dedicated laser system and image acquisition capabilities. Details of this facility are described. This system was utilized to study surface heating and cooling of a PB(110) crystal subjected to picosecond laser irradiation. Diffraction pattern sensitivity to temperature is due to the surface Debye-Waller factor which results in a reduced number of elastically scattered electrons with lattice heating. Development of a picosecond time-resolved surface temperature probe is a key step to study the dynamics of surface melting that was well demonstrated in our present work. A heat diffusion model of surface heating and cooling has also been constructed. Results on static RHEED experiments on surface melting of Pb(110) crystal are presented. The existence of a surface melting (disordering) transformation at temperatures at least 50°K below the bulk melting point was observed in our experiments. Quantitative RHEED study of this phenomena are in progress.

Short note; 2 refs.

44078 (INIS-SU–98, pp. 57) **Orientational dependences of characteristic X-ray and elastically scattered 0.75 MeV proton yields from a Si monocrystal.** Shchagin, A.V.; Ryzhkov, V.I.; Dzen'kovskij, V.G.; Nikolajchuk, L.I.; Khizhnyak, N.A. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 1 fig.

44079 (INIS-SU–98, pp. 58) **Study of peculiarities of generation of K-lines of characteristic radiation in Ni monocrystal excited by proton channeling.** Shchagin, A.V.; Pristupa, V.I.; Khizhnyak, N.A. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44080 (INIS-SU–98, pp. 59) **Study of peculiarities of charged particle interaction with monocrystalline targets.** Anufriev, O.V.; Grigor'ev, A.N.; Nikolajchuk, L.I.; Kharchenko, N.I.; Khizhnyak, N.A. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 1 ref.; 1 fig.

44081 (INIS-SU–98, pp. 60) **Experimental study of parametric X radiation from silicon, quartz and diamond crystals.** Adishchev, Yu.N.; Apanasevich, A.P.; Afanasenko, V.P. and others. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 1 tab.

44082 (INIS-SU–98, pp. 61) **Ultrasonic wave resonant effect on the formation of parametric X radiation.** Baryshevskij, V.G.; Polikarpov, I.V. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44083 (INIS-SU–98, pp. 62) **Polarization of parametric X radiation.** Adishchev, Yu.N.; Verzilov, V.A.; Vorob'ev, S.A.; Pleshkov, G.A.; Potylitsyn, A.P.; Uglov, S.R. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44084 (INIS-SU–98, pp. 63) **Multiple scattering effect on relativistic electron passage through monocrystals.** Vorob'ev, S.A.; Vyatkin, E.G.; Dolgikh, V.A. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44085 (INIS-SU–98, pp. 64) **Effect of thermal lattice vibrations on the characteristics of channeled relativistic electron radiation from diamond-like crystals.** Vorob'ev, S.A.; Vyatkin, E.G.; Dolgikh, V.A. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 1 fig.

44086 (INIS-SU–98, pp. 65) **Resonant effect of hypersonic acoustic waves on channeled positron radiation in monocrystals.** Mkrtchyan, A.R.; Gasparyan, R.A.; Gabrielyan, R.G. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44087 (INIS-SU–98, pp. 66) **Radiation of high energy particles in oriented monocrystals. Status of theory and experiment.** Bajer, V.N.; Katkov, V.M.; Strakhovenko, V.M. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44088 (INIS-SU–98, pp. 67) **Electron-positron pair production on a photon in oriented crystals. Contemporary relation of theory and experiment.** Bajer, V.N.; Katkov, V.M.; Strakhovenko, V.M. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44089 (INIS-SU–98, pp. 68) **Coherent X radiation of 1200 MeV electrons in a silicon crystal.** Morokhovskij, V.L.; Adejshvili, D.I.; Blazhevich, S.V.; Bochek, G.L.; Kas'yan, S.V.; Maslov, N.I.; Pristupa, V.I.; Shchagin, A.V. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 1 ref.; 1 fig.

44090 (INIS-SU–98, pp. 69) **Quasimonochromatic parametric X-ray spectra.** Kas'yan, S.V.; Morokhovskij, V.L.; Pristupa, V.I.; Shchagin, A.V. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 1 fig.

44091 (INIS-SU–98, pp. 71) **Channeled electron line radiation from natural diamond monocrystals.** Bazylev, V.A.; Mikheev,

S.A.; Tulupov, A.V. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44092 (INIS-SU–98, pp. 72) **Suppression of relativistic particle coherent radiation in crystals. Theory and experiment.** Laskin, N.V.; Shul'ga, N.F. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.; 1 fig.

44093 (INIS-SU–98, pp. 73) **Relativistic electron multiple scattering effect on the linear polarization extent of coherent bremsstrahlung in crystals.** Mondrus, I.N.; Nasonov, N.N.; Samin, V.M.; Truten', V.I. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44094 (INIS-SU–98, pp. 74) **Relativistic electron incoherent scattering effect on their radiation in crystals.** Nasonov, N.N.; Fomin, S.P.; Shul'ga, N.F. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44095 (INIS-SU–98, pp. 75) **Dislocation effect on channeled electron spontaneous radiation.** Kovaleva, E.A.; Malyshevskij, V.S. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44096 (INIS-SU–98, pp. 76) **Study of electron radiation in a thick diamond monocrystal.** Avakyan, R.O.; Avetisyan, A.Eh.; Asatryan, R.A.; Dallakyan, K.R.; Gyurdzhyan, V.A.; Danagulyan, S.S.; Kozogyan, O.S.; Matevosyan, Eh.M.; Tarosyan, S.P. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44097 (INIS-SU–98, pp. 77) **Radiation spectrum of particles channeling in a two-dimensional periodic model potential. Exact solution.** Golinej, I.Yu.; Rud'ko, V.N. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44098 (INIS-SU–98, pp. 78) **Parametric X-ray spectrum in case of a three-wave diffraction.** Ivashin, A.V.; Feranchuk, I.D. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44099 (INIS-SU–98, pp. 79) **On the increasing spectral-angular energy density of oscillator diffractive radiation.** Zege, A.V.; Tikhomirov, V.V. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44100 (INIS-SU–98, pp. 80) **Optical parametric radiation by relativistic particles.** Batrakov, K.G.; Dubovskaya, I.Ya. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44101 (INIS-SU–98, pp. 80-81) **Study of the effect of particle bremsstrahlung energy losses on the parametric X radiation from crystals.** Savenko, D.M. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44102 (INIS-SU–98, pp. 81) **Radiation spectra of positrons channeling in a bent crystal.** Taratin, A.M. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44103 (INIS-SU–98, pp. 82) **Peculiarities of accelerated particle radiation transitions from forbidden (Borman diffraction) zones into channeling levels in crystals.** Vysotskij, V.I.; Kuz'min, R.N.; Maksyuta, N.V. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with*

crystals. Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44104 (INIS-SU–98, pp. 83) **Peculiarities of radiation by a charged particle moving in the field of modulated randomly oriented crystal domains.** Vysotskij, V.I.; Kyz'min, R.N.; Maksyuta, N.V. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44105 (INIS-SU–98, pp. 84) **Hypersonic wave effect on particle channeling in crystals.** Avakyan, A.R.; Shi, Ya. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44106 (INIS-SU–98, pp. 88) **Applications of the β-particle channeling effect in an external periodical wave field.** Vel'ko, A.V.; Kalashnikov, N.P. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44107 (INIS-SU–98, pp. 96) **Coherent photoproduction of electron-positron pair-type in crystals.** Darbinyan, S.M.; Ispiryan, K.A.; Margaryan, A.T. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44108 (INIS-SU–98, pp. 153) **Study of the sputtered substance spatial distributions under argon ion bombardment of a copper polycrystal in a wide range of incidence angles.** Dodonov, A.I.; Krylova, E.A.; Mashkova, E.S.; Molchanov, V.A.; Fayazov, I.M.; Fedorovich, S.D. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44109 (INIS-SU–98, pp. 155) **Energy and angular distributions of primary recoils atom knocked out of crystals under ion bombardment.** Borisov, A.M. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.

44110 (INIS-SU–98, pp. 156) **Isotopic effect in energy spectra of an ionized sputtered component.** Nikitenkov, N.N.; Kositsyn, L.G.; Markova, N.M.; Shulepov, I.A. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short Communication

44111 (INIS-SU–98, pp. 157) **Reflection coefficients of a light ion beam from layer-inhomogeneous targets.** Afanas'ev, V.P.; Manukhin, V.V.; Naueks, D. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.
Short note; 2 refs.; 1 fig.

44112 (INIS-SU–98, pp. 158) **Study of heavy multicharged ion tracks in a metal surface.** Geguzin, Ya.E.; Monastyrenko, V.E.; Ter-Ovanes'yan, E.A. AN SSSR, Moscow (USSR); Moskovskij Gosudarstvennyj Univ., Moscow (USSR). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki. 1988. (In Russian). (CONF-8805309–: 18. All-Union conference on charged particle interaction with crystals, Moscow (USSR), 30 May - 1 jun 1988). In *Summaries of reports of the 18. All-union conference on charged particle interaction with crystals.* Order Number DE89012189/JAW. Available from NTIS (US Sales Only), PC A08/MF A01; INIS.

44126 (INIS-SU–100, pp. 152-155) **Selection of the geometry of the Moessbauer experiment on scattering taking into account cosine spectra distortion.** Belozerskij, G.N.; Semenov, V.G.; Sokolov, A.Yu. AN Litovskoj SSR, Vilnyus (USSR). Inst. Fiziki; AN SSSR, Moscow (USSR). Nauchnyj Sovet po Yadernoj Spektroskopii. 1988. (In Russian). (CONF-8805315–: 7. seminar on precise measurements in nuclear spectroscopy, Vilnyus (USSR), 26-27 May 1988). In *Problems of precision in nuclear spectroscopy. Collection of materials.* Order Number DE89012201/JAW. Available from NTIS (US Sales Only), PC A09/MF A01; INIS.

It is reported that cosine distortion for the Moessbauer spectrum brings about line expansion, decrease in its amplitude and the shift of its position to higher velocities. These changes are the more pronounced the further is the line from velocity zero in the spectrum and the higher is its body angle value. The application of a source with the minimum possible spot diameter with the retention of its activity is suggested, and the collimation conditions are discussed. 3 refs.; 1 fig.

44127 (INIS-SU–102) **Experimental and theoretical physics. Collection.** Kratkie soobshcheniya po fizike. no. 9. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. V (In Russian). Available from NTIS (US Sales Only), PC A04/MF A01; INIS.
Kratkie soobshcheniya po fizike.; no. 9.

The effect of magnetic point defects, causing coercive force in high-quality ferrite-garnet films, on dynamics of an isolated domain wall (DW) is investigated. It is experimentally proved that DW interaction with defects results in effective reduction of DW mobility. 7 refs.; 3 figs.

44128 (INIS-SU–102, pp. 32-33) **Lanthanum and yttrium oxisulfide films grown from the vapor phase.** Maksimovskij, S.N.;

Sidorov, P.P. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Experimental and theoretical physics. Collection.* Order Number DE89012199/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 9.

For the first time lanthanum and yttrium oxysulfide films are grown by light evaporation. The structure, photoluminescence, optical IR transmission of these films are investigated. Luminescent films of Y_2O_2S:Eu; La_2O_2S:Tb; La_2O_2S:Yb, Er are grown on sapphire, molten quartz, barium fluoride sbstrates. It is shown that the films are characterized by intensive photoluminescence, and emission lines of activator rare earth ions belong to, at least, two centre types. While studying IR transmission of La_2O_2S:Tb thin films absorption lines are observed in the 8-18μm range, which cannot be observed in three-dimensional monocrystals. 4 refs.

In *Selected topic in nuclear structure. V. 1. Proceedings of 20 winter school, 13-26 April 1985, Zakopane, Poland.* Order Number DE89632395/JAW. Available from NTIS (US Sales Only), PC A19/MF A01 - OSTI; INIS.

The case of perfect alignment of the magnetic field in the direction of the z-axis of the EFG is considered. Isomeric state produced and aligned by nuclear reaction in a single crystal with hexagonal structure is analysed and experiments at the cyclotron (on isomeric states) of ^{71}Ge, ^{69}Ge are described. 11 refs., 13 figs. (L.I.).

44130 (KEK–88-9, pp. 109-115) **High energy magnetic excitations.** Endoh, Yasuo (Tohoku Univ., Sendai (Japan). Dept. of Physics). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The report emphasizes that the current development in condensed matter physics opens a research field fit to inelastic neutron scattering experiments in the eV range which is easilly accessed by spallation neutron sources. Several important subjects adopted at thermal reactors are shown. It is desired to extend the implementation of the spectroscopic experiments for investigation of higher energy magnetic excitations. For La_2CuO_4, which is the mother crystal of the first high Tc materials found by Bednortz and Muller, it seems to be believed that the magnetism is well characterized by the two-dimensional Heisenberg antiferromagnetic Hamiltonian, and it is widely accepted that the magnetism is a most probable progenitor of high Tc superconductors. The unusual properties of spin correlations in this crystal have been studied extensively by standard neutron scattering techniques with steady neutrons at BNL. FeSi is not ordered magnetically but shows a very unique feature of temperature induced magnetism, which also has been studied extensively by using the thermal neutron scattering technique at BNL. In these experiments, polarized neutrons are indispensable to extract the clean magnetic components out of other components of non-magnetic scattering. (N.K.).

44131 (KEK–88-9, pp. 116-122) **Dynamic structure factor S(Q, ω) in liquids.** Okada, Isao (Tokyo Inst. of Tech. (Japan)). National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). Dec 1988. (CONF-8710488–: Workshop on neutron scattering research with intense spallation neutron source, 6-7 Oct 1987). In *Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tomorrow'. First meeting of Japan-UK collaboration in neutron scattering research.* Order Number DE89906380/JAW. Available from NTIS (US Sales Only), PC A10/MF A01.

The dynamic structure factor S(Q, ω) can be determined by inelastic neutron scattering of liquids. This quantity can be derived also from molecular dynamics (MD) simulation. Recently, the S(Q, ω) determination of some simple molten salts by neutron scattering has intensively been done by McGreevy's group at University of Oxford. The present report introduces their work and compare some of their results with those obtained from molecular dynamics (MD) simulation by Dixon. Results on the total dynamic structure factor for molten $Cs^{37}Cl$ and $Cs^{N}Cl$ at 973K, and quasi-dispersion curves for molten CsCl are shown and discussed. The total static structure factor $S_T(Q)$ derived from $S_T(Q, \omega)$ by integration with respect to ω agrees well with that obtained by diffraction. Dixon has carried out MD simulation for NaI. The experimental data by McGreevy et al. are compared with the data derived by the MD simulation. The general shape of the experimental curves, including the de Gennes narrowing, is predicted reasonably by the MD simulation. In conclusion, the single-particle motion is represented by $S_+^s(Q, \omega)$ and $S_-^s(Q, \omega)$. The longitudinal 'acoustic' type modes are represented by $C_{mm}{}^L(Q, \omega)$. The longitudinal 'optic' type modes are represented by $C_{qq}{}^L$. It is expected that many of the features of the Spallation Neutron Source at the Rutherford Appleton Laboratory will make it ideally suited for extending this kind of work. (N.K.).

44132 (LA-UR–89-2419) **High-temperature/high-pressure x-ray diffraction: Recent developments.** Schiferl, D.; Johnson, S.W.; Zinn, A.S. Los Alamos National Lab., NM (USA). [1989]. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890798–6: AIRAPT and EHPRG international high pressure science and technology conference, 17-21 Jul 1989). Order Number DE89015255/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have developed two Merrill-Bassett diamond-anvil cells for specialized high-temperature uses. The first is constructed largely of rhenium to provide uniform, constant P and T on the order of 20 GPa at 1200 K for extended periods. The second is for single-crystal x-ray diffraction, but can be heated to 630 K at 20 GPa to grow single-crystal samples which cannot be produced at room temperature. With this cell, the crystal structure of ε-O_2 was shown to be monoclinic with a = 3.649 A, b = 5.493 A, c = 7.701 A, and B = 116.11° at 19.7 GPa. 15 refs.

44133 (ORNL/FTR–3341) **[Sir Roger Elliott 60th birthday symposium, Oxford, England, United Kingdom Atomic Energy Agency, Harwell, and Rutherford Appleton Laboratory, Didcot, July 10–14, 1989]: Foreign trip report.** Cooke, J.F. Oak Ridge National Lab., TN (USA). 31 Jul 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC05-84OR21400. Order Number DE89016394/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The author attended the Sir Roger Elliott 60th Birthday Symposium held at the Clarendon Laboratory, Oxford, England. After this three-day symposium the author spent two days at the Rutherford Appleton Laboratory and presented a seminar on excitations in magnetic systems. This visit was intended to provide continuity to a long-standing and productive collaboration with members of the scientific staff. During a visit to Harwell, the author participated in discussions about Harwell's theoretical physics program and their work on cold fusion.

44134 (RAL–89-031) **Permanent recording of transient lattice perturbations.** Russell, F.M. Rutherford Appleton Lab., Chilton (UK). Apr 1989. 15p. Order Number DE89634306/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A new solid-state recording mechanism has been identified which is capable of recording the tracks of charged light leptons and the tracks of uncharged supra-ballistic phonons. The dynamic range for recording charged leptons exceeds 50:1 with a minimum sensitivity of dE/dx $\simeq$ 0.01 MeV/cm. For supra-ballistic phonons their energy must exceed $\simeq$ 10eV to be recorded. The recording mechanism depends upon the presence in a crystal of muscovite of a low concentration of mobile impurity atoms which are normally energetically unable to accrete. The passage of a charged particle or of an energetic ballistic phonon locally modifies the crystal internal potentials to allow the impurity atoms to accrete, driven by their thermal energy, to form stable nucleation sites. Further accretion of the impurity at the nucleation sites causes massive decoration giving a lateral magnification of upto 10^5 and so rendering the tracks visible to the unaided eye. (Author).

44135 (SSI–89-01) **The neutrino - an indirectly ionizing radiation.** Persson, L. National Inst. of Radiation Protection, Stockholm (Sweden). 13 Jan 1989. 8p. Order Number DE89796488/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

In this note a description of the neutrino interaction with matter is given indicating that the neutrino is an indirectly ionizing radiation. (orig.).

44136 (UCRL–99314) **Analysis of DC magnetron sputtered beryllium films.** Price, C.W.; Hsieh, E.J.; Lindsey, E.F.; Pierce, E.L.; Norberg, J.C. Lawrence Livermore National Lab., CA (USA). Oct 1988. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8810401–1: High power laser optical components topical meeting, 24-25 Oct 1988). Order Number DE89015727/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We are evaluating techniques that alter the columnar grain structure in sputtered beryllium films on fused silica substrates. The films are formed by DC magnetron sputtering, and the columnar structure, which is characteristic of this and most other deposition techniques, is highly detrimental to the tensile strength of the films. Attempts to modify the columnar structure by using RF-biased sputtering combined with nitrogen pulsing have been successful, and this paper describes the analyses of these films. Sputtered beryllium films are quite brittle, and the columnar structure in particular tends to form a distinct intergranular fracture; therefore, the grain structure was analyzed in fractured specimens using the high-resolution capability of a scanning electron microscope (SEM) equipped with a field emission gun (FESEM). Ion microanalysis using secondary-ion mass spectroscopy (SIMS) was conducted on some specimens to determining relative contamination levels introduced by nitrogen pulsing. The capability to perform quantitative SIMS analyses using ion-implanted specimens as standards also is being developed. This work confirms that the structure of DC magnetron sputtered beryllium can be improved significantly with combined nitrogen pulsing and RF-biased sputtering. 8 refs.

44137 Diffraction effects along the normal to a grain boundary. Vitek, J.M. (9501970); Vaudin, M.D.; Ruhle, M.; Sass, S.L. *Scripta Metallurgica (USA)*, 23(3): 349-354 (Mar 1989).

Much work has been done in recent years on studying the structure and properties of grain boundaries and interfaces in general. Included in these studies is work done by the authors on diffraction effects from grain boundaries along the reciprocal lattice direction which passes through the origin and is normal to a planar boundary. These studies considered the simplified case of kinematical diffraction effects caused by distortions normal to the planar interface in the boundary region and are distinct from extensive electron and X-ray diffraction studies of extra reflections resulting from periodicities in the plane of a grain boundary. Discrepancies exist in the results of these different studies. Differences were found between the calculated intensity distributions. These differences were attributed to the calculation procedures. Second, the effect of crystal shape on the diffraction calculations was disputed. Finally, the application of the results to experimental work and the interpretation of experimental results were matters of controversy. The intent of the present paper is to clarify and resolve these differences, including some issues that have not been raised previously in the literature.

44138 Low-energy He^+ scattering from deuterium adsorbed on Pd(110). Bastasz, R. (Sandia National Laboratories, Livermore, California 94551 (US)); Felter, T. E.; Ellis, W. P. *Physical Review Letters (USA)*, 63(5): 558-561 (31 Jul 1989). DOE Contract AC04-76DP00789.

We show that low-energy, helium ion scattering in the forward direction provides a surface specific means for directly observing adsorbed deuterium. Energy spectra of 1-keV $^4He^+$ scattered at angles less than 30° from a surface with adsorbed D contain the two maxima predicted for classical single scattering. Angular studies indicate that D atoms adsorbed on the Pd(110) surface at room temperature reside in the troughs between atom rows.

44139 Ion dose dependence of the sputtering yield of Ru(0001) at very low fluences. Burnett, J. W. (Materials Science and Chemistry Divisions, Argonne National Laboratory, Argonne, Illinois 60439 (US)); Pellin, M. J.; Calaway, W. F.; Gruen, D. M.; Yates, J. T., Jr. *Physical Review Letters (USA)*, 63(5): 562-565 (31 Jul 1989). DOE Contract W-31-109-ENG-38.

The neutral sputtered flux from a Ru single crystal oriented along the (0001) axis has been determined as a function of primary ion dose in real time using nonresonant photoionization techniques coupled with time-of-flight mass spectrometry. The data reveal, surprisingly, that the sputtering yield is twice as large from an undamaged surface as that from a slightly damaged surface. The sputtering yield decreases until steady state is reached at a primary ion fluence of only 2×10^{15} ions cm^{-2}. Data analysis results in an estimated cross section for damage of $(2.7\pm1.0)\times10^{-15}$ cm^2.

44140 Growth dynamics of sputter deposition. Bales, G. S. (School of Physics, Georgia Institute of Technology, Atlanta, Georgia 30332 (US)); Zangwill, A. *Physical Review Letters (USA)*, 63(6): 692-692 (7 Aug 1989).

A Comment on the Letter by R. P. U. Karunasiri, R. Bruinsma, and J. Rudnick, Phys. Rev. Lett. 62, 788 (1989).

44141 Finite-temperature defect properties from free-energy minimization. LeSar, R. (Department of Materials Science and Engineering, University of Michigan, Ann Arbor, Michigan 48109 (US)); Najafabadi, R.; Srolovitz, D. J. *Physical Review Letters (USA)*, 63(6): 624-627 (7 Aug 1989).

We present two simple, but accurate, techniques for calculating the finite-temperature atomic structure and free energy of any solid defect (point or extended). The finite-temperature equilibrium atomic structure and thermodynamic properties of defects in solids are obtained *self-consistently* by minimizing the *reenergy* of the solid with respect to the coordinates of the atoms. Application of the two methods to a perfect crystal and one with a vacancy show that both methods yield excellent agreement with Monte Carlo calculations for temperatures up to at least 75% of the melting point.

44142 Theory of the acoustical properties of symmetric multilayer structures. Martin, B. G. (Analysis Consultants, El Toro, California 92630 (US)). *Journal of Applied Physics (USA)*, 66(5): 1931-1934 (1 Sep 1989).

A theoretical investigation has been made of the acoustical properties of symmetrical multilayer structures. Acoustic symmetric multilayers (ASMs) exhibit behavior analogous to that of optical symmetric multilayers. For a three-layer ASM, a range of effective acoustic impedances is possible merely by varying the thickness of the middle layer for a given frequency. This has the advantage that one can design an antireflection coating for virtually any substrate impedance. Some illustrative examples are given.

44143 Spectroscopy of positronium emission from alkali halides. Tuomisaari, M. (Lawrence Livermore National Laboratory, Livermore, California 94550 (US)); Howell, R. H.; McMullen, T. *Physical Review [Section] B: Condensed Matter (USA)*, 40(4): 2060-2069 (1 Aug 1989). DOE Contract W-7405-ENG-48.

Energy and angular distributions of the positronium emitted from single-crystal samples of the alkali halides LiF, NaF, KCl, KBr, and KI following bombardment of the surfaces with 0.1–4-keV positrons are reported. Energetically narrow positronium distributions were formed at the positron implant depth, and this hot positronium diffused to the surface, losing energy in the process. An analysis of the data using a diffusion model yields an estimate of the strength of the positronium-phonon coupling. This coupling is found to be energy dependent, with the effective deformation potential decreasing as the positronium energy increases. Positronium work functions and binding-energy estimates are also given. The angular distributions of the emitted positronium from all samples except LiF were sharply peaked in the forward direction. The energy distributions from the LiF samples also differed from those of the other alkali halides by showing two distinct energy components instead of a single peak.

44144 Self-consistent phonon approach to thermal vibrations in model small clusters. Shimamura, S. (Department of Physics, Virginia Commonwealth University, P.O. Box 2000, Richmond, Virginia 23284-2000 (US)); Khanna, S. N.; Jena, P. *Physical Review [Section] B: Condensed Matter (USA)*, 40(4): 2459-2463 (1 Aug 1989).

Thermal atomic vibrations in small clusters have been studied theoretically using the self-consistent phonon method. We have calculated the free energy for model clusters in which constituent atoms interact with each other through a pairwise potential and are vibrating with a frequency ω_n for the nth atom. Thermal softening and thermal expansion are investigated as a function of temperature for different structures of cluster sizes, N=7, 9, and 13. A structure with pentagonal caps is shown to be more stable vibrationally than a section of cubic structure of the same size. The instability temperature in the present model clusters is discussed in the context of melting in small clusters.

44145 Trapping model for thermal and nonthermal positrons in metals. Gramsch, E. (Physics Department, Brookhaven National Laboratory, Upton, New York 11973-6000 (US)); Lynn, K. G. *Physical Review [Section] B: Condensed Matter (USA),* 40(4): 2537-2540 (1 Aug 1989). DOE Contract AC02-76CH00016.

In order to correct the discrepancies of the simple two-state trapping model currently being used to explain the temperature dependence of positron annihilatoin in metals, we have modified the standard trapping model to implicitly include nonthermal trapping of positrons in vacancies and divacancies. A positron-energy-loss function and energy-dependent trapping rates were used to calculate the mean lifetime and intensity of the trapped and untrapped positrons. We have fitted this model to the lifetimes for aluminum measured by Jackman *et al.* Results obtained for the formation enthalphy of vacancies and divacancies show the feasibility of the model to fit the experimental data.

44146 Mean-field theory for the *t-J* model. Jayaprakash, C. (Department of Physics, The Ohio State University, Columbus, Ohio 43210 (US)); Krishnamurthy, H. R.; Sarker, S. *Physical Review [Section] B: Condensed Matter (USA),* 40(4): 2610-2613 (1 Aug 1989).

We present a new mean-field theory for the *t-J* model using a representation in which singly occupied sites or spins are represented by bosons and empty sites or holes by fermions. We obtain a phase diagram which includes ferromagnetic, antiferromagnetic, spiral (with the pitch inversely proportional to the density of holes), and disordered spin-liquid phases, with a clear separation of charge and spin excitations. We comment on the conditions for obtaining superconductivity in the model.

44147 Spin-1 *XXZ* model on the square lattice. Lin, H. Q. (Department of Physics, Brookhaven National Laboratory, Upton, New York 11973 (US)); Emery, V. J. *Physical Review [Section] B: Condensed Matter (USA),* 40(4): 2730-2732 (1 Aug 1989). DOE Contract AC02-76CH00016.

We compute the ground-state energy and spin-spin correlations on various finite square lattices exactly for the spin-1 *XXZ* model. Estimates of the ground-state energy and order parameters are obtained by extrapolation to infinite lattice. Our results are consistent with the existence of long-range order for all values of anisotropy Δ.

The breakdown of the Meissner-Ochsenfeld effect in the three-dimensional Bose gas as the applied field passes through its critical value is an entropy-driven weakly first-order transition, rather than the second-order transition usually ascribed to the system. The transition is second order at the usual Bose condensation temperature Tc as well as T=O, with a line of first-order transitions connecting these critical points. The first-order transitions make the Bose gas resemble familiar superconductors, and a Landau-Ginzburg analysis indicates that the Bose gas is always a type-I superconductor.

A review is given of recent neutron scattering measurements on $La_{2-x}Sr_xCuO_4$ and Y $Ba_2Cu_3O_{6+x}$ single crystals. Well defined, modulated magnetic excitations are observed in a high quality single crystal of $La_{1.85}Sr_{0.15}CuO_4$. This crystal exhibits a sharp superconducting transition at 33 K with a high Meissner effect. For magnetic excitation energies of 9 MeV and lower, the intensity drops substantially below 150K. Similar magnetic scattering of $YBa_2Cu_3O_{6+x}$ in the superconducting region is now being sought. 10 refs., 2 figs.

Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Structural properties of the high temperature oxide superconductor $Y_1Ba_2Cu_3O_{7-x}$ have been studied by static lattice simulation methods. Empirical (ionic) potentials, derived on the basis of experimental data, are used to describe the basic structural properties of the superconducting oxides. Several potential models, with different location of the extra charge for the O_7 compound, have been tested with respect to experimental lattice parameters. Fair parameterizations have been found in almost all cases, but they are usually valid only for a specific oxygen content. However, potential models, consistent both for O_6 and O_7, have been found. We present the best of our ionic models, where, in O_7, two thirds of the holes are distributed in the sheet-site oxygens and one third in oxygens between the sheet and chain planes. 12 refs.

Kratkie soobshcheniya po fizike.; no. 10.

A new model of the state of third group impurities in A_4B_6 superconductors is suggested. The model is based on results of the study, where the potential of impurity caused perturbation $v_d(r)$ is approximated by the sum of seven functions, located symmetrically in points, where the product of $V_d(r)$ and density of valent electrons in the crystal is maximal. $V_d(r)$ potential splits two states of s-symmetry from zones: σ-from zone of Pb,S (symmetrical combination of six p-functions Te)-from valent zones. the suggested model explains the difference in In and Te behaviour in PbTe. Superconductivity in PbTe(Tl) is discussed. 11 refs.; 2 figs.

Kratkie soobshcheniya po fizike.; no. 10.

Qualitative explanation of anomalous behaviour of same characteristics of high-temperature superconductors near T_c is suggested on the basis of assumption about carrier pairing from a wide band through their interaction with the system of local pairs. The mentioned anomalies can appear due to strong fluctuations of local pair concentration in such two-band system. Experimental results, obtained for $YBa_2Cu_3O_7$ are in qualitaive agreement with the suggested model. 23 refs.; 2 figs.

The results of neutron diffraction experiments performed on high-T_c superconductors of the 1-2-3 type by using the time-of-flight diffractometer are discussed. The final profile R-factor is 2,7%. Ncutron diffraction on $YBa_2Cu_3O_7$ and $GdBa_2Cu_3O_7$ single crystals has been measured with the aim to reveal possible long-period modulation of the atomic structure. The incommensurate peaks are also absent, the lowest limit for the period of modulation is as high as 400A. The structure of $YBa_2(Cu_{1-x}Fe_x)_3O_{7-\sigma}$ has been determined at x=0,006 and 0,10. Some indications of occupying (2q) positions in the centre of octahedra with Fe atoms have been received. The (1a) positions on Cu-O chains contain both Fe-atoms and vacancies. 13 refs.; 4 figs.; 4 tabs.

44158 (JINR-N–4(30)-88, pp. 49-54) **Neutron scattering study of $YBa_2Cu_3O_{6+\sigma}$ ($0<\sigma<0,8$) oxides.** Balagurov, A.M. (Joint Inst. for Nuclear Research, Dubna (USSR). Neutron scattering study of $YBa_2Cu_3O_{6+\sigma}(\sigma)$=0-0,8 compounds is performed. For σ=0,08 we observed tetragonal crystal structure with lattice parameters a=3,840 A and c=11.737 A and an additional diffractional peak which may be considered as (1/2 1/2 1) magnetic reflection. Any other magnetic reflections corresponding to AF Structure suggested earlier have not been found within the limits of the experimental resolution and intensity. 7 refs.; 3 figs.; 1 tab.

44159 (JINR-N–4(30)-88, pp. 55-62) **On determination of the magnetic field penetration depth in oxide superconductors by polarized neutrons reflection.** Korneev, D.A.; Chernenko, L.P. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

The $R_+(k_{perpendicular})$ reflection coefficients are calculated for $YBa_2Cu_3O_7$ film sprayed on $SrTiO_3$ ($k_{perpendicular}$) is a normal to the surface component, of a wavevector of neutrons using the quatum mechanical model describing the reflection of neutrons from the surface of a thin superconducting film. The dependence of $S(k_{perpendicular})R_+(k_{perpendicular})/R_-(k_{perpendicular})$ on the depth of magnetic field penetration into a superconductor Λ on the external magnetic field H, and on a film thickness d is analysed. The possibility is motivated of carrying out experiments on determination of Λ under conditioncompared favourably with those under which the experiments with ceramic samples of high temperature superconductor have been conducted. 7 refs.; 4 figs.; 1 tab.

44160 (JINR-N–4(30)-88, pp. 63-66) **μSR-investigation of the high-T_c superconductor $HoBa_2Cu_3O_7$.** Duginov, V.N. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems); Grebinnik, V.G.; Graboj, I.E. and others. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

A high-T_c superconductor $HoBa_2Cu_3O_{7-\sigma}$ ($T_c \sim 93$ K) has been investigated by the μSR-method in a zero external magnetic field, the sample being cooled from the temperature much higher than T_c to T=4,2 K. The fast increasing of the muon spin depolarization in the temperature range 10-4,2 K is observed, which indicates the fluctuating production of the magnetic ordering in this sample. 3 refs.; 3 figs.

44161 (JINR-N–4(30)-88, pp. 67-72) **Positron annihilation in a high-temperature superconductor $YBa_2Cu_3O_{7-\sigma}$.** Wawryszczuk, J. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Nuclear Problems); Lewandowski, M.; Rybakov, V.N.; Yutlandov, I.A.; Goworek, T.; Mazurek, P.; Uchevatkin, I.F. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Positron annihilation as a function of temperature in high-temperature superconductors $YBa_2Cu_3O_{7-\sigma}$ has been investigated. It is shown that a change in the annihilation character at the transition into superconducting state is relatively small. The change of tau_1 and tau_2 positron lifetimes as well as of the intensity of the component with tau ~J_2 and Doppler broadening S parameter allows one to assume that transition into superconducting state is accompanied with a certain decrease in electron density and with decreasing number of defects or increasing their size. 9 refs.; 1 fig.

44162 (JINR-N–4(30)-88, pp. 73-77) **Effect of high energy radiation on critical parameters of superconducting ceramics $YBa_2Cu_3O_7$.** Aleksandrov, A.S. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of High Energy); Astapov, A.A.; Drobin, V.M. and others. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. In *JINR rapid communications. Collection of papers.* Order Number DE89012196/JAW. Available from NTIS (US Sales Only), PC A06/MF A01; INIS.

Critical temperature (T_c) and critical current density (j_c) of high temperature superconducting (HTSC) ceramics $YBa_2Cu_3O_7$ were measured as functions of dose from $5x10^3$ Gy to $3x10^8$ Gy. Samples were irradiated at room temperature by protons with energies 0,66 and 8,09 GeV and by ^{12}C with energy 3,65 GeV/nucleon. Radiation degradation of critical parameters j_c and is obviously connected with the formation of disordered regions, leading to the electron localization and to the infractions of Josephson contacts between ceramics grains. 8 refs.; 2 figs.; 1 tab.

44163 (LA-UR–89-2469) **Superconductivity from valence fluctuations with finite u.** Brandow, B.H. Los Alamos National Lab., NM (USA). 1989. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890718–17: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, 23-28 Jul 1989). Order Number DE89015302/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The finite-U paring mechanism of Newns is found to be opposed by a magnetic tendency arising from Gutzwiller renormalization of the hybridization. This competition restricts superconductivity and also reproduces the parabolic rise and fall of T_c in $La_{2-x}Sr_xCuO_4$ with increasing x. 9 refs.

44164 (LA-UR–89-2587) **High-energy helium backscattering for the compositional analysis of thin-film oxide-superconductors.** Hubbard, K.M.; Martin, J.A.; Muenchausen, R.E.; Tesmer, J.R.; Nastasi, M. Los Alamos National Lab., NM (USA). [1989]. 9p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8906186–2: Materials Research Society materials analysis workshop, 14-17 Jun 1989). Order Number DE89015277/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Recent experiments have demonstrated that the broad elastic-scattering resonance for 8.8 MeV helium bombardment of oxygen can be exploited to measure the oxygen content of YBaCuO thin films. A potential difficulty with such measurements is distortion of the backscattering spectrum due to resonant scattering from the substrate elements, which could prevent the accurate integration of peak areas. We have measured the elastic scattering cross sections for Sr and Ti, relative to Gd, with He ions in the energy range of 2.2–8.8 MeV, and a scattering angle of 166°. The results verify that resonant scattering from the substrate does not interfere with the high-energy compositional analysis of YBaCuO films deposited on $SrTiO_3$. Scattering cross sections for Ca, measured relative to Ba, have also been determined for application to the analysis of BiSrCaCuO and TlCaBaCuO films. Because of resonant scattering from Ca at beam energies above 6 MeV, two backscattering measurements are required for these materials: one at 8.8 MeV to determine the O content, and one at or below 6 MeV to determine the Ca content. Anticipating a more general applicability of this technique to the analysis of metal-oxide films, data are also presented for a number of elements, as an empirical guideline, which give the beam energies above which scattering cross sections deviate from their Rutherford values, and must be determined experimentally. 10 refs., 6 figs., 4 tabs.

44165 (LBL–27402) **Specific heat of the high-T_c superconductor $(Bi_{1.66}Pb_{0.34})Ca_2Sr_2Cu_3O_{10}$.** Fisher, R.A.; Kim, S.; Wu, Y.; Phillips, N.E.; Ledbetter, H.M.; Togano, K. Lawrence Berkeley Lab., CA (USA). Jun 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-890718–16: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, Stanford, CA (USA), 23-28 Jul 1989). Order Number DE89015343/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The specific heat (C) was measured for H = 0 and 7T in the ranges 0.4 to 20K and 65 to 125K. The coefficient of the low-temperature linear term in C was 0 ± 0.5 mJ/K^2-mole. On initial cooling, an anomaly in C was observed at T_c, but there were dramatic temperature hysteresis effects. 5 refs., 4 figs.

44166 (UCRL–100539) **Calculation of the nuclear quadrupole resonance spectra of $YBa_2Cu_3O_{7-x}$.** Winter, N.W.; Violet, C.E. Lawrence Livermore National Lab., CA (USA). Jun 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-48. (CONF-890718–20: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, Stanford, CA (USA), 23-28 Jul 1989). Order Number DE89016646/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Nuclear quadrupole resonance (NQR) and nuclear magnetic resonance (NMR) studies on $^{63,65}Cu$ have demonstrated the the resonance properties of these nuclei can give important information about the electronic structure of the high temperature superconductor $YBa_2Cu_3O_{7-x}$ as well as the exchange coupling energy between the Cu(2) sites. Measurements for various oxygen stoichiometries have given insight into the effect of oxygen content on the valence state of the Cu. In the work reported here, the electric field gradient (EFG) tensors at the Cu(1) and Cu(2) sites in $YBa_2Cu_3O_{7-x}$, have been determined from calculations on large clusters for x = 0 and 1. 13 refs., 2 tabs.

44167 (UCRL–101311) **Criterion for the superfluid/superconducting phase transition in two dimensions.** Peters, D.S.; Alder, B.J. Lawrence Livermore National Lab., CA (USA). Jun 1989. 3p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890718–21: International conference on materials and mechanisms of superconductivity - high-temperature superconductors, Stanford, CA (USA), 23-28 Jul 1989). Order Number DE89016642/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

It has been found that He^4 films undergo a superfluid transition when the degeneracy parameter $\lambda^*/a \simeq 1$. This criterion also holds for the high temperature superconductors and, numerically, for Bose-Coulomb systems in two dimensions. 5 refs., 1 fig., 1 tab.

44168 Static Coulomb model for high-temperature superconductivity. Mahan, G. D. (Department of Physics and Astronomy, University of Tennessee, Knoxville, Tennessee 37996-1200 (US)). *Physical Review [Section] B: Condensed Matter (USA),* 40(4): 2200-2204 (1 Aug 1989). DOE Contract AC05-84OR21400.

Superconductivity in copper oxide planes is calculated using the static Coulomb model. This model is based upon the attractive nature of the Fourier transform of the Coulomb interaction for wave vectors near $a\mathbf{Q}=\pi(\pm1,\pm1)$. Values of λ and $\Delta(\mathbf{k})$ are calculated at $T=0$ and also at T_c where the gap equation becomes a linear matrix equation. For some regions of parameter space values of λ are near unity. The gap $\Delta(\mathbf{k})$ is anisotropic.

44169 Charge distributions and valency in copper oxide crystals related to superconductivity. Goodman, G. L. (Argonne National Laboratory, Argonne, Illinois 60439 (US)); Ellis, D. E.; Alp, E. E.; Soderholm, L. *Journal of Chemical Physics (USA),* 91(5): 2983-2992 (1 Sep 1989). DOE Contract W-31-109-ENG-38.

We present an overview of the discrete variational method for calculating orbital states of a molecular cluster in the local density approximation. Then we introduce a new method of embedding a finite molecular cluster in a crystal lattice. This new technique of cluster weighting is based on the bulk stoichiometry of the crystal and the Mulliken populations for chemically complete atoms—those atoms that have all their covalently bonded nearest neighboring atoms also in the cluster. We have applied our new approach to calculate linear-combination-of-atomic-orbitals ground states for seven copper oxide crystals and Cu metal. The average net Mulliken charges calculated for Cu atoms in this way are shown to correlate well with the observed energies of the Cu *K* edge feature in x-ray absorption spectra of these materials. Several of these compounds are important to understanding the high T_c superconductivity of copper oxides.

44170 (AD-A–205837/8/XAB) **Nonlinear systems of conservation laws. Final report, July 1987-September 1988.** Shearer, M. North Carolina Univ., Chapel Hill, NC (USA). Dept. of Mathematics. 21 Nov 1988. 6p. Available from NTIS, PC A02/MF A01.

This final report covers research in the following three areas: (1) Non-strictly hyperbolic conservation laws: Change of type of equations modeling three-phase flow in porous media, solution of Riemann problems; (2) Plastic flow in two dimensions: Linear stability of homogeneous deformations, justification of the quasidynamic approximation; and (3) Glimm's method for the vibrating string' discovery of exact solutions related to a periodic motion.

44171 (AD-A–206158/8/XAB) **Comparison of basis function and iteration solutions to the Fredholm integral equation of the first kind. Master's thesis.** Carter, M.F. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). Mar 1989. 71p. (AFIT/GNE/ENP–89M-1). Available from NTIS, PC A04/MF A01.

The purpose of this thesis is to compare methods for solving the Fredholm integral equation of the first kind. The Fredholm equation has several practical applications including geology, superconductivity, and aerodynamics. Of specific interest is its application to determining radiation spectra using data from underground nuclear-effects simulations. The two basic solution methods studied were the basis function and the iteration methods. The basis function method is a representation of the unfolded spectrum by a series of Planckian or cubic spline functions. The iteration method scales the unfolded spectrum so that its weighted integral over a given interval matches that of the actual spectrum. Both basis function methods produced excellent results when the actual spectrum was a sum of its basis functions. The cubic spline method produced unfolded spectra which were good approximations for discontinuous actual spectra. However, there was a significant dropoff of the spectrum for the cubic spline for higher energies. The iteration method produced accurate approximations for actual spectra that were both basis function and discontinuous spectra. There were two problems with this method: the unfolded spectra were discontinuous at the discontinuities of the weighting function and noisy data sometimes produced large discontinuities in the unfolded spectra.

44172 (BiBoS–354/89) **Charge-monopole interaction in Kaluza-Klein theory: A path integral treatment.** Bernido, C.C. Bielefeld Univ. (Germany, F.R.). Forschungszentrum Bielefeld-Bochum-Stochastik (BiBoS). 1989. 17p. (CONF-8901145–: 3. international conference on path integrals from meV to MeV, Bangkok (Thailand), 9-13 Jan 1989). Available from Bielefeld Univ. (Germany, F.R.). Forschungszentrum Bielefeld-Bochum-Stochastik (BiBoS).

The charged particle-monopole system in a five-dimensional spacetime is analyzed by using the Feynman path integral approach. Space and time transformations are necessary in carrying out the path integration. The Green's function is obtained for distances much larger than the radius of the compactified fifth dimension. (orig.).

44173 (BiBoS–357/89) **On a realistic theory for quantum physics.** Duerr, D.; Zanghi, N.; Goldstein, S. Bielefeld Univ. (Germany, F.R.). Forschungszentrum Bielefeld-Bochum-Stochastik (BiBoS). 1989. 20p. Available from Bielefeld Univ. (Germany, F.R.). Forschungszentrum Bielefeld-Bochum-Stochastik (BiBoS).

We discuss some ideas about quantum physics which we think are of relevance for the future evolution of the field. These ideas, though old, are either unknown or misunderstood. Out point here is that a strong realistic position has consequences: It offers a completely natural understanding of 'standard quantum mechanics'; it fully reveals the non-local character of nature; it guides the search of a fundamental unified theory of the microscopic and macroscopic world. (orig.).

44174 (ENEA-RT-TIB–85-28) **Comments on the binomial states of the quantized radiation field.** Dattoli, G.; Gallardo, J.; Torre, A. ENEA, Frascati (Italy). Centro Ricerche Energia. Oct 1985. 12p. Order Number DE89761934/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

In a recent paper, the binomial state (B.S.) of the quantized radiation field was introduced. This new state describes a binomial probability distribution of photons and reduces, under appropriate limits, to either a coherent or to a number state. These states are well-known, their properties have been studied in detail since the pioneering days of quantum optics. They may be generated in many different ways. For example, a classical current generates states with a Poissonian counting probability. Furthermore, it has been stressed that the Jaynes-Cummings Hamiltonian may lead to a binomial counting distribution when, initially, the two-level atom is in the excited state and the field is the vacuum. The interest for the B.S. is mainly due to the fact that, under specific conditions, it produces light which is antibunched, sub-poissonian and squeezed. It has also been shown that the B.S. interpolates between the number and coherent states in the sense that it shares the properties of both. In this paper, a simple physical model is discussed which shows that B.S., or at least binomial counting distributions, can be obtained in the simple physical picture of an electron moving in the field of two counterpropagating waves. Furthermore, it is also pointed out that the antibunched (bunched) radiation can be obtained in a stimulated Thomson scattering.

44175 (INIS-SU–102, pp. 3-6) **Theory of invariants and symmetry of many-particle quantum systems.** Karasev, V.P. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Experimental and theoretical physics. Collection.* Order Number DE89012199/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 9.

Symmetry of many-particle quantum systems with fundamental "internal" SU(n) symmetry is analyzed. In the space of SU(n)-invariant states a new algebra class of dynamic symmetry generalizing algebras, describing the Green parastatistics at n2, is determined. The possible applications of the results are discussed. 17 refs.

In *Experimental and theoretical physics. Collection.* Order Number DE89012199/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 9.

Stable (one-dimensional and multi-dimensional) accurately solvable (AS) and quasi-accurately solvable (QAS) quantum mechanical models are classified. Requirements for hamiltonian hermittivity and model stability cause definite restrictions on spectral parameters. The whole variety of AS an QAS models results from B(λ) function degeneration. The Schroedinger equations for these models are given. It is shown that trigonometrical, hyperbolic and elliptical QAS models exist only in curved spaces and can be classified using the given diagrams. 5 refs.

44177 (INIS-SU–103/A, pp. 34-36) **On the classical formulation of quantum mechanics problems.** Maglaperidze, T.I.; Ushveridze, A.G. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). Kratkie soobshcheniya po fizike.; no. 12.

Regular method of polynomial two-dimensional exact problem solution is suggested. It is based on conformal transformation of Schroedinger equation (SE). Two cases are considered; when the energy in SE is fixed (separate spectrum point is sought) and when it is arbitrary (the whole spectrum is sought). Three classes of exact solutions for discrete spectrum of two-dimensional SE with special form polynomial potentials are constructed. 4 refs.

44179 (IYF–88-105) **Vector fields and gravity on the lattice.** Khatsymovsky, V.M. AN SSSR, Novosibirsk (USSR). Inst. Yadernoj

Fiziki. 1988. 15p. Order Number DE89633885/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The problem of discretization of vector field on Regge lattice is considered. Our approach is based on geometrical interpretation of the vector field as the field of infinitesimal coordinate transformation. A discrete version of the vector field action is obtained as a particular case of the continuum action, and it is shown to have the true continuum limit. 26 refs.; 3 figs.

44180 (JINR-D–17-88-95, pp. 55-58) **Equations of quantum statistical mechanics and equations with counterterms of quantum field theory.** Biryukov, A.A. (Kujbyshevskij Gosudarstvennyj Univ., Kuibyshev (USSR)). Joint Inst. for Nuclear Research, Dubna (USSR). 1988. (In Russian). (CONF-8708341–: 4. International symposium on selected topics in statistical mechanics, 25-29 Aug 1987). In *4. International symposium on selected topics in statistical mechanics.* Order Number DE89012150/JAW. Available from NTIS (US Sales Only), PC A21/MF A01; INIS.

Equations of quantum statistical mechanics and quantum field theory with counterterms are considered. The main feature of the equations consists in the presence of additional components to the system Hamiltonian with certain physical content. An explicit form of these correlation Hamiltonians is ascertained in particular models. To illustrate the proposed equations a quantum electrodynamics model is considered in the secondary quantization presentation. 2 refs.

44181 (JINR-R–4-88-829) **Some problems of relativistic quantum mechanics with a set number of degrees of freedom.** Lev, F.M. Joint Inst. for Nuclear Research, Dubna (USSR). 1988. 104p. (In Russian). Order Number DE89633869/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

116 p.

Consideration is given to some problems of relativistic quantum mechanics (RQM) of systems with assigned number of degrees of freedom. The arguments are given for the fact that RQM doesn't violate QFT at low energies. From the thechnical point of view RQM is more simple, than QFT, therefore it is suitable for calculation of different relativistic effects at low energies. Method of Sokolov packing operators is discussed in detail. It prescribes the method of construction of generators of Poincare group representation with automatic fuldilment of conditions of relativistic invariance and cluster separability. Particular attention is paid to apparent calculation of hamiltonian of N-particle system in $1/c^2$ approximation, addition of interactions in the framework of Sokolov method. The study is designated for specialists, dealing with calculations of concrete processes in few-nucleon systems, with calculations of relativistic correlations for binding energies.

44182 (ROM2F–89-004) **Variational principles for a relativistic stochastic mechanics.** Marra, R.; Serva, M. Rome Univ. II (Italy). Dipt. di Fisica. 1989. 4p. Order Number DE89633886/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

An extension to the relativistic case of the stochastic variational principles both of Lagrangian and Eulerian type is proposed. The action used is the mean classical action evaluated on the paths of relativistic covariant diffusions. The resulting equations of motion are the relativistic stochastic Lagrange equations. 17 refs.

44183 (SFB–237-49(prepr.)) **Dirichlet forms and generalized Schroedinger operators.** Albeverio, S.; Brasche, J.; Roeckner, M. Bochum Univ. (Germany, F.R.). Sonderforschungsbereich 237 - Unordnung und Grosse Fluktuationen; Bochum Univ. (Germany, F.R.). Inst. fuer Mathematik. May 1989. 31p. Available from Bochum Univ. (Germany, F.R.). Sonderforschungsbereich 237 - Unordnung und Grosse Fluktuationen.

In these lectures we show how Dirichlet forms can be used in order to study very singular perturbations of Schroedinger operators. We also sketch the relation between Dirichlet forms, Markov semigroups and Markov processes. Let us mention that it is precisely the close relations between Dirichlet forms as analytic tools and probabilistic tools which gives a special charm to the theory and its full power. (orig./HSI).

44184 **Random multiplication in a diffusive medium.** Rosenbluth, M. N. (Department of Physics, B-019, University of California, San Diego, La Jolla, California 92093 (US)). *Physical Review Letters (USA),* 63(5): 467-469 (31 Jul 1989).

We consider the problem of multiplication in a diffusive random medium. For time-independent one-dimensional white-noise multiplication "potential" we find asymptotic growth $\sim\exp(t^3)$, while for a "potential" with finite-range correlation we find asymptotic growth $\sim\exp(t^2)$.

44185 **Multivariable Wilson polynomials.** Tratnik, M. V. (Center for Nonlinear Studies and Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)). *Journal of Mathematical Physics (New York) (USA),* 30(9): 2001-2011 (Sep 1989).

A multivariable biorthogonal generalization of the Wilson polynomials is presented. These are four distinct families, which in a special case occur in two complex conjugate pairs, that satisfy four biorthogonality relations among them. An interesting limit case is the multivariable continuous dual Hahn polynomials.

44186 **Discrete symmetries in periodic-orbit theory.** Robbins, J. M. (Department of Physics, University of California, Berkeley, California 94720 (US)). *Physical Review [Section] A: General Physics (USA),* 40(4): 2128-2136 (15 Aug 1989).

The application of periodic-orbit theory to systems which possess a discrete symmetry is considered. A semiclassical expression for the symmetry-projected Green's function is obtained; it involves a sum over classical periodic orbits on a symmetry-reduced phase space, weighted by characters of the symmetry group. These periodic orbits correspond to trajectories on the full phase space which are not necessarily periodic, but whose end points are related by symmetry. If the symmetry-projected Green's functions are summed, the contributions of the unperiodic orbits cancel, and one recovers the usual periodic-orbit sum for the full Green's function. Several examples are considered, including the stadium billiard, a particle in a periodic potential, the Sinai billiard, the quartic oscillator, and the rotational spectrum of SF_6.

44187 **First-passage time in a bistable potential with colored noise.** Ramirez-Piscina, L. (Department d'Estructura i Constituents de la Materia, Facultat de Fisica, Universitat de Barcelona, Diagonal 647, 08028 Barcelona, Spain (ES)); Maria Sancho, J.; Javier de la Rubia, F.; Lindenberg, K.; Tsironis, G. P. *Physical Review [Section] A: General Physics (USA),* 40(4): 2120-2127 (15 Aug 1989).

A precise digital simulation of a bistable system under the effect of colored noise is carried out. A set of data for the mean first-passage time is obtained. The results are interpreted and compared with presently available theories, which are revisited following a new insight. Discrepancies that have been discussed in the literature are understood within our framework.

44188 (IREQ–7909) **The Varennes tokamak.** Grek, B.; Bolton, R.; Johnston, T.W.; Shkarofsky, I.P.; Van Andel, H. Institut de Recherche d'Hydro-Quebec, Varennes, PQ (Canada). 1979. vp. (CE–02664). Available from CANMET/TID, Energy, Mines and Resources Canada, 555 Booth St., Ottawa, Ont., Canada K1A 0G1; $3.40 CAN minimum, plus $0.25/p after 10 pages.

This report summarizes the scientific and technological guidelines for the Varennes tokamak, both machine and program, and includes a very preliminary estimate of cost and schedule. The role of the Varennes magnetic fusion facility in the Canadian national fusion program and the international fusion effort is outlined. Design parameters, machine and plasma, physics, plasma diagnostics, the operation of the machine, and the technological and diagnostic programs are discussed. Impurity control, divertors investigation, and the need for longer plasma pulses in order to simulate the operation of an industrial reactor, are underlined. 2 refs., 26 figs., 1 tab.

Attention is focused on the possibility of resonance-enhanced deuteron Coulomb barrier penetration. Because of the many-body nature of the interactions of room-temperature deuterons diffusing through a lattice possessing deuterons in many of the interstitial positions, the diffusing deuterons can resonate on the atomic scale in the potential wells bounded by the ascending walls of adjacent Coulomb barriers and thereby penetrate the Coulomb barriers in a fashion vastly underestimated by two-body calculations in which wells for possible resonance are absent. Indeed, perhaps the lack of robust reproducibility in cold fusion originates from the narrowness of such transmission resonances. 4 refs., 1 fig.

44190 (UCRL–101583) **Cold confusion.** Chapline, G. Lawrence Livermore National Lab., CA (USA). Jul 1989. 10p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-8905143–9: NATO international advanced courses on the nuclear equation of state, Peniscola (Spain), 12 May - 3 jun 1989). Order Number DE89016654/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

On March 23 two chemists, Martin Fleischmann and Stanley Pons startled the world with a press conference at the University of Utah where they announced that they had achieved nuclear fusion at room temperatures. As evidence they cited the production of "excess" amounts of heat in an electrochemical apparatus and observation of neutron production. While the production of heat in a chemical apparatus is not in itself unusual the observation of neutrons is certainly extraordinary. As it turned out, though, careful measurements of the neutron production in electrochemical apparatus similar to that used by Fleischmann and Pons carried out at dozens of other laboratories has shown that the neutron production fails by many orders of magnitude to support the assertion by Fleischmann and Pons that their discovery represents a new and cheap source of fusion power. In particular, independent measurements of the neutron production rate suggest that the actual rate of fusion energy production probably does not exceed 1 trillionth of a watt. This paper discusses the feasibility that cold fusion is actually being achieved. 7 refs.

44191 (DOE/ER/53201–2) **Stellarator Transport Theory.** Hitchon, W.N.G. Wisconsin Univ., Madison, WI (USA). [1989]. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-85ER53201. Order Number DE89016371/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A program of research in Stellarator Transport Theory is described, with emphasis on kinetic modeling of divertor plasmas. We have developed a very efficient numerical solution of the kinetic equation. It was implemented first for the ions, self-consistently with the electrostatic potential, Φ, assuming quasineutrality and a Boltzmann distribution of electron density. The presheath problem has been solved, confirming analytic work in the collisionless limit and extending the earlier work to collisional cases. The effect of a transverse electric field on divertor flows in IMS is to redistribute the diverted flux. We have shown (experimentally) that $\vec{E} \times \vec{B}$ drifts are responsible. We thus used the 'presheath' model to examine the effect of magnetic mirrors along a diverted field line, both on the diverted fluxes and on the electrostatic potential. The calculated variation $\Delta\Phi \sim O(T_e)$ can be expected to set up significant flows. Numerical calculations of the stellarator ambipolar electric field and bootstrap current have been done. Further analytical and computational work on ripple transport is under way, in conjunction with IPP-Garching and as part of the US-USSR collaboration. Our earlier analytic calculations of stellarator ripple transport have also been modified to apply to tokamaks. 11 refs., 5 figs.

44192 (DOE/ER/53244–10) **Reversed field pinch experiments: Progress report.** Colorado Univ., Boulder, CO (USA). Dept. of Chemistry. [1989]. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract FG02-87ER53244. Order Number DE89016114/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This report covers the first four months of the eight-month period from 3/24/89 to 11/23/89. This period of time is relatively short, nevertheless significant progress has been made. The paragraphs below describe progress in the following areas: installation of new computers and data acquisition equipment, measurement of ion temperature by Doppler broadening, development of an insertable probe, an experimental study of shell current, and a study of the dependence of ion temperature on fill density. Also described are projects to be completed before November 23, a detailed study of the dependence of resistive wall modes on vertical field index, and a study of the effect of controlled field perturbations on RFP performance. Our plans to increase the plasma current in FY89 by expanding the ohmic heating bank have been modified. The plasma current will be increased by adding an iron core in FY90. The reason for this change is discussed in the FY90 research plan.

44193 (DOE/ER/53266–26) **Equilibrium and stability studies for an iron-core tokamak with a poloidal divertor.** Solano, E.R.; Neilson, G.H.; Lao, L.L. Texas Univ., Austin, TX (USA). Fusion Research Center. 21 Jul 1989. 25p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER53266. (FRCR–338). Order Number DE89016107/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A study of plasma equilibrium and stability in a tokamak with an unsaturated iron core is presented. A spool model is developed for the iron. Both, a simplified force balance code and a Grad-Shafranov solver are used to study the plasma equilibrium. It is observed that the iron can strongly modify the conditions for equilibrium and stability, and in some cases an infinite cylinder model for the iron core is not adequate. New criteria for plasma position stability in the presence of an iron core are introduced. 17 refs., 4 figs., 3 tabs.

44194 (DOE/ER/53266–27) **Plasma position stability studies for TEXT-Upgrade.** Solano, E.R.; Neilson, G.H. Texas Univ., Austin, TX (USA). Fusion Research Center. 21 Jul 1989. 21p. Sponsored by U.S. DOE Energy Research. DOE Contract FG05-88ER53266. (FRCR–339). Order Number DE89016108/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A study of the vacuum vessel action on the plasma as a passive stabilizer is presented. The position feedback system is modelled in frequency domain to ascertain if the plasma in TEXT-Upgrade can be stabilized. 4 refs., 3 figs., 3 tabs.

44195 (ENEA-RT-FUS–87-38) **JET high resolution bent crystal spectrometer.** Bartiromo, R.; Bombarda, F.; Giannella, R.; Mantovani, S.; Panaccione, L.; Pizzicaroli, G. ENEA, Frascati (Italy). Centro Ricerche Energia. Jun 1988. 24p. Order Number DE89761965/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

This paper describes the bent crystal spectrometer, of the Johann type, built for the JET tokamak. This high resolution (Lambda/Delta Lambda approx. equivalent to 20000) instrument is characterized by a very long focal length (25 m) allowing the crystal and the position sensitive detector to be placed outside the JET torus hall, in order to keep the background radiation induced noise to an acceptable level. By means of the shape analysis of X-ray lines emitted by medium Z, highly ionized impurities present in the plasma, the ion temperature can be evaluated. Relevant information about other plasma parameters such as electron temperature, impurity ionization equilibrium and concentration, and plasma toroidal velocity can be obtained by means of the analysis of different lines present in the spectra and of their wavelengths. Examples of the results obtained during the first year of operation of this instrument are also illustrated.

44196 (ENEA-RT-FUS–88-06) **Confinement and diffusion in Tokamaks.** McWilliams, R. ENEA, Frascati (Italy). Centro Ricerche Energia. Sep 1988. 17p. Order Number DE89761846/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The effect of electric field fluctuations on confinement and diffusion in tokamaks is discussed. Based on the experimentally determined cross-field turbulent diffusion coefficient, D sub perpendicular approx. = 3.7 cT_e /e B (delta n_i /n_i) rms which is also derived by a simple theory, the cross-field diffusion time, tp = a^2 /D

sub perpendicular, is calculated and compared with experimental results from 51 tokamaks for standard Ohmic operation.

44197 (GA-A–19634) **Recent electron cyclotron heating experiments with low field launch of the ordinary mode on the DIII-D tokamak.** Lohr, J.; Edlington, T.; Groebner, R.J.; Ilin, V.; James, R.A.; Janz, S.; Kalmykov, S.; Luce, T.; Matsuda, Kyoko; Moeller, C.P. General Atomics, San Diego, CA (USA). Jun 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER51114. (CONF-8905159–2: Joint IAEA technical committee meeting on ECE and ECRH and 7th joint workshop on ECE and ECRH (EC-7), 8-11 May 1989). Order Number DE89016665/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

In recent ECH experiments on DIII-D, the H-mode regime of improved confinement has been observed using low field launch of the ordinary mode at power levels in excess of 1 MW. This result has been obtained for both the fundamental and second harmonic resonances using ECH as the sole source of auxiliary heating. The approximately linear scaling of the H-mode power threshold with toroidal field has been extended to 2.1 T. The largest stored energies, about 150 kJ for 1.5 MW total input power, occurred when the fundamental resonance was at the center of the discharge, and the stored energy decreased monotonically to the Ohmic value as the resonance location was scanned to the small major radius of the torus. The time derivative of the total energy at the start of the ECH pulse was calculated. Under the questionable assumption that the energy confinement time does not immediately degrade with application of ECH, this indicated that, for central heating, slightly less than half of the injected ECH power was absorbed by the plasma at the fundamental resonance and approximately one third was absorbed when the toroidal field was reduced so that heating was at the second harmonic resonance. Calculated single pass absorption was 85% and 12%, respectively, for these cases. In the case of the second harmonic, substantial conversion to the extraordinary mode takes place upon reflection from the wall following the first pass through the plasma. Despite the poor calculated absorption for the second harmonic, the H-mode transition was clear and showed the characteristic behavior previously observed with extraordinary mode heating. 7 refs., 10 figs.

44198 (GA-A–19676) **A review of recent results with electron cyclotron heating in tokamaks.** Prater, R. General Atomics, San Diego, CA (USA). May 1989. 10p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER51114. (CONF-8905120–21: 8. American Physical Society topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989). Order Number DE89015217/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Many experiments using Electron Cyclotron Heating (ECH) of plasmas in tokamaks have been reported over the past two years. At a power level of 4 MW, ECH has achieved electron temperatures as high as 10 keV in the T-10 tokamak, and the H-mode has been attained in divertor discharges in DIII-D and JFT-2M. Regarding global energy confinement in either L-mode or H-mode, ECH appears to be quite similar in efficiency to neutral injection, but in addition to bulk heating it has been useful for many purposes, including study of local electron heat diffusivity through pulse modulated heating; suppression of sawteeth, Edge Localized Modes, and other MHD activity; suppression of disruptions; preionization and startup; and current drive. In this paper, progress in these areas which has been reported since the IAEA meeting in 1986 will be summarized. 44 refs.

44199 (IAE–4663/6) **Toroidal rotation retordation and ion anomalous transport by drift waves in a tokamak.** Osipenko, M.V.; Pogutse, O.P.; Shurygin, R.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 20p. (In Russian). Order Number DE89634427/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A set of equations of anomalous rotating plasma hydrodynamics in a weak collision mode with allowance for running - away and trapped particles has been obtained in terms of quasilinear theory taking into account spectra close to those measured experimentally. It is shown that in a banana regime the anomalous transport is determined by ions, the viscosity and thermal conductivity coefficients coinciding within the numerical factor. The scaling obtained for the time of a toroidal rotation slowing down due to anomalous viscosity is in reasonable agreement with the experiment. 14 refs.

44200 (INIS-SU–103/A, pp. 59-61) **On the oscillation spectrum of a thin-wall tubular plasma cylinder excited by REB in a waveguide.** Rukhadze, A.A. (AN SSSR, Moscow (USSR). Inst. Obshchej Fiziki); Selivanov, I.A.; Shkvarunets, A.G. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Quantum radiophysics. Collection.* Order Number DE89012203/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 12.

Results of numerical analysis of electromagnetic oscillation frequency spectrum of a thin-wall tubular plasma cylinder, excited by REB in a circular metallic waveguide under Cherenkov resonance with arbitrary intensity of longitudinal external magnetic field, are presented. 4 refs.; 1 fig.

44201 (INIS-SU–109/A, pp. 35-37) **Influence of a finite magnetic field on the frequency spectrum of electromagnetic oscillations excited by REB in a plasma waveguide.** Guseva, G.I. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Experimental and theoretical physics.* Order Number DE89012198/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 10.

Approximate solution of dispersion equation in a finite magnetic field was obtained for the case of high oscillation modes excited by REB in a plasma waveguide. It is shown that new branches of oscillation spectrum appear as compared to approximation of an infinite magnetic field. This affects sufficiently the character of radiation frequency dependence on plasma density. 4 refs.; 1 fig.

44202 (INIS-SU–109/A, pp. 45-47) **Plasma filament ellipticity effect on eigen modes of fast magnetoacoustic wave.** Moroz, P.E. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Experimental and theoretical physics.* Order Number DE89012198/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 10.

It is shown that plasma filament ellipticity doesn't prevent the existence of eigen modes of fast magnetoacoustic wave. Field structure and conditions of excitation of various eigen modes were found. 3 refs.; 2 figs.

44203 (IPPCZ–275) **On the stochastic interaction of monochromatic Alfven waves with toroidally trapped particles.** Krlin, L.; Pavlo, P.; Tluchor, Z.; Gasek, Z. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Jul 1987. 45p. Order Number DE89634428/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Monochromatic Alfven wave interaction with toroidaly trapped particles in the intrinsic stochasticity regime is discussed. Both the diffusion in velocities and in the radial position of bananas is studied. Using a suitable Hamiltonian formalism, the effect of wave parallel components E-tilde$_{paral}$ and B-tilde$_{paral}$ is investigated. The stochasticity threshold is estimated for plasma electrons and for thermonuclear alpha-particles (neglecting the effect of B-tilde$_{paral}$) by means of direct numerical integration of the corresponding canonical equations. Stochasticity causes transfer between trapped and untrapped regimes and the induced radial diffusion of bananas. The latter effect can considerably exceed neoclassical diffusion. The effect of B-tilde$_{paral}$ was only estimated analytically. It consisted in frequency modulation of the banana periodic motion coupled with a possible Mathieu instability. Nevertheless, for B-tilde$_{paral}$ corresponding to E-tilde$_{paral}$, the effect seems to be weaker than the effect of E-tilde$_{paral}$ when the thermonuclear regime is considered. (author). 14 figs., 36 refs.

44204 (IPPCZ–276) **Numerical simulation of high current relativistic electron flow.** Astrelin, V.T.; Vrba, P. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Jun 1987. 18p. (In Russian). Order Number DE89634364/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The numerical results are presented of electron beam generation in high-current diodes with various cathode shapes in the presence of an external longitudinal magnetic field. It is shown that current density near the anode surface strongly depends on the shape of the cathode; for a concave cathode the quasi-hollow beam is generated, for a conical one the beam is almost homogeneous. The propagation of the hollow relativistic electron beam through the anode foil into an evacuated or plasma filled drift tube is also studied. The stationary current of an uncompensated electron beam propagating through the evacuated drift tube is limited by the value of the space-charge limiting current. The numerical simulation of hollow beam propagation through the plasma column showed that the limiting current could be exceeded when an external longitudinal magnetic field was applied. Two-dimensional relativistic electromagnetic current line code "POISSON2" is very useful to optimize the diode design and is capable of determining the beam characteristics in the steady state when no reflexing point is established. (author). 13 figs., 6 refs.

44205 (IPPCZ–278) **Ultrasoft X-ray diagnostics of short living plasmas.** Raus, J.; Piffl, V. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Sep 1987. 15p. Order Number DE89634387/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Ultrasoft X-ray plasma diagnostics was implemented by using X-ray diodes with Al photocathodes and submicrometer nitrocellulose filters. The design, clibration and characteristic properties of the apparatus are described. The main results of REB-heated plasma diagnostics are presented as an example of use. (author). 8 figs., 10 refs.

44206 (IPPCZ–279) **Comments on edge turbulence during lower hybrid current drive experiment on CASTOR tokamak.** Stoeckel, J.; Kryska, L.; Zacek, F.; Nanobashvili, S. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Mar 1988. 21p. Order Number DE89634365/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Edge plasma electrostatic turbulence is discussed from the point of view of its role in inducing anomalous particle transport. Preliminary results are presented of plasma edge fluctuation measurements obtained in the CASTOR tokamak by using the Langmuir probe technique. The level of edge turbulence found is sufficiently high to explain the anomalous particle losses observed in the ohmic heting regime of the tokamak discharge. On the other hand, it decreases appreciably during the combined lower hybrid current drive and ohmic heating regimes, the particle confinement time simultaneously increasing about twice. Thus, the fluctuation induced transport seems to be responsible for the anomalous particle transport in the CASTOR tokamak. (J.U.). 10 figs., 26 refs.

44207 (IPPJ–892) **Courant condition free modified partially-implicit method. Revised electromagnetic particle code PS2M for bounded plasmas with conducting walls.** Abe, Hirotada; Nakajima, Sadanojyo. Nagoya Univ. (Japan). Inst. of Plasma Physics. Oct 1988. 21p. Order Number DE89906585/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The distortion of the dispersion of the light waves or the nonphysical frequency alias exists in the Courant condition relaxed methods already proposed. The present note proposes a method for correcting this distortion without generating the alias. The proposed method is obtained by merging the merit of one type of methods to another type of method. Nielson and Lindman have developed a 2-dimensional electromagnetic code in which the Maxwell equations are differenced implicitly with respect to time only for the transverse quantities while the equations for the longitudinal quantities and the equations of motion for the charged particles are differenced explicitly. In the present study, the implicit difference equations are modified to remove the Courant restriction of $ck_{max}\Delta t<2$ and to remedy the distortion of numerical dispersion relation of the light waves without affecting its numerical stability and without generating frequency alias. Thus, new equations for the maxwell equations are derived. The proposed method is embodied to the particle code PS2M. It is verified that the method is more effective than those previously presented as for correcting distortion of the dispersion of the light waves without generation of the nonphysical frequency alias. (N.K.).

44208 (IPPJ-DT–143) **Rotating magnetic probe.** Fujiwaka, Setsuya; Matsuura, Kiyokata. Nagoya Univ. (Japan). Inst. of Plasma Physics. Nov 1988. 7p. (In Japanese). Order Number DE89906388/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

A rotating magnetic probe is proposed to measure the plasma current and position of the current channel of tokamaks in long pulse or steady operations; in tokamaks these measurements are important for plasma position control. Basic idea of the structure of the rotating magnetic probe and its characteristics are described. (author).

44209 (IYF–88-116) **Spectroscopic studies of plasma produced in hydrogen-cesium discharge.** Antsiferov, V.V.; Beskorovajnyj, V.V.; Bel'chenko, Yu.I.; Derevyankin, G.E.; Maksimov, A.M.; Pan'kin, V.G.; Skripal', L.P. AN SSSR, Novosibirsk (USSR). Inst. Yadernoj Fiziki. 1988. 21p. (In Russian). Order Number DE89634388/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The plasma of high-current glow hydrogen-cesium discharge with planotron geometry of electrodes is investigated by means of spectroscopic methods. Element and charge composition of the plasma is determined. Dynamics of certain spectral lines of hydrogen, cesium and electrode material - molybdenum at different charge parameters is investigated. Change in densities of atom hydrogen, atom and ionized cesium and electrode sputtering during a charge pulse is traced. H_α and H_β lines per one pulse (10^{-3} s) of a charge are measured with high spectral resolution. Estimations of hydrogen atom temperature and electron concentration in the plasma are obtained. The charge plasma radiation energy in the spectrum range from 400 to 800 nm is measured. 17 refs.; 12 figs.

44210 (JAERI-M–89-020) **Characteristics of edge localized mode in JFT-2M H-mode.** Matsumoto, Hiroshi; Funahashi, Akimasa; Goldston, R.J. and others. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1989. 31p. Order Number DE89906498/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Characteristics of edge localized mode (ELM/ERP) during H-mode plasma of JFT-2M were investigated. It was found that ELM/ERP is mainly a density fluctuation phenomena in the edge, and electron temperature in the edge except just near the separatrix is not very much perturbed. Several experimental conditions to controll ELM/ERP are, plasma density, plasma ion species, heating power, and plasma current ramping. ELM/ERPs found in low density deuterium discharge are suppressed by raising the density. ELM/ERPs are pronounced in hydrogen plasma compared with deuterium plasma. ELM/ERPs seen in hydrogen plasma or in near marginal H-mode conditions are suppressed by increasing the heating power. ELM/ERPs are found to be suppressed by plasma current ramp down, whereas they are enhanced by current ramp up. MHD aspect of ELM/ERP was investigated. No clear MHD features of ELM/ERP were found. However, reversal of mode rotation seen imediately after ELM/ERP suggests the temporal return to L-mode during the ELM/ERP event. (author).

44211 (JAERI-M–89-033) **Review of JT-60 experimental results from June to October, 1988.** Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1989. 273p. Order Number DE89906468/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

After the achievement of AEC (Atomic Energy Commission) milestone in October, 1987, a new divertor coil has been installed to produce divertor plasmas with a single null at the buttom. A pellet injector was also installed during the same shut down period. This report presents the results from the experiment held from June to October in 1988. Major experimental issues during this phase are: (1) confinement and (2) divertor characteristics of lower X-point discharges, (3) enhancement of confinement with pellet injection, (4) ion heating with ICRF of LHRF, (5) current drive with LHRF or ICRF, and evaluation of bootstrap current. (J.P.N.).

44212 (JET-R–89-02) **Coupling of slow waves near the lower hybrid frequency in JET: implications for the launcher design.** Litaudon, X.; Moreau, D. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. 1989. 23p.

Order Number DE89634366/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The physical and coupling properties of the JET Lower Hybrid antenna have been investigated numerically with a 2-D computer code based on the linear coupling theory. The antenna utilises an array of multijunction units and their "self-adaption" property is analysed. The geometrical parameters of the multijunction unit have been properly optimised (choice of the location of the E-plane junctions, wall thickness) and their values have been taken into account in the launcher manufacture. With such an optimisation, power reflection coefficient below 1.5% and directively based on the current drive efficiency between 60% to 70% are expected at the optimum plasma density ($n_e \simeq 10^{18}$ m^{-3}). Edge effects are minimised using two shorted passive waveguides on each side of the antenna. Finally the accessibility limit on the coupling is investigated. (Author).

44213 (JET-R–89-03) **Neoclassical transport calculations using the impurity transport code 'STRAHL'.** Behringer, K. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. 1 Feb 1989. 47p. Order Number DE89634392/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The impurity transport code 'Strahl', already providing some rudimentary neoclassical transport facilities, has been described in a previous report. The code has been amended to include different collisionality regimes of impurity and plasma ions, and to allow a second impurity species to be specified and included in the transport calculations. More input parameters have been defined, which were necessary for the more detailed transport coefficients, but also give greater flexibility in the modelling of actual plasma pulses. Finally, the possibility of following the evolution of plasma parameters by means of a sequence of code re-entries has been facilitated, and a number of minor changes were made, which were thought to be necessary or convenient. The present report gives an account of the equations used in the above amendments, and of the ideas behind other changes made. New listings of the code 'STRAHL' and relevant subroutines are appended. Furthermore, a brief description and a listing of the program 'NEPLO' are included, an indispensable prerequisite for displaying all input parameters to 'STRAHL', which is using the same subroutines for calculating transport coefficients, as well as atomic data and radiation. (Author).

44214 (JET-R–89-05) **Transport analysis using the TRANSP code.** Balet, B.; Stubberfield, P.M. Commission of the European Communities, Abingdon (UK). JET Joint Undertaking. 1989. 52p. Order Number DE89634393/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

TRANSP is a time dependent transport analysis code. Experimental data is used wherever possible to define plasma parameters, and models similar to those found in simulation codes are used to supplement this data. TRANSP first solves the magnetic field diffusion equation and then uses the particle and energy conservation equations to calculate local transport coefficients. The code also produces simulations of certain diagnostic measurements which can be used as consistency checks. Obtaining good results from TRANSP is strongly dependent on the reliability of the experimental data and on an understanding of the limitations of the various diagnostic measurements. This report contains a detailed discussion of a typical transport analysis. Section II describes the various experimental data which can be provided as input to TRANSP either through a namelist or in a user PPF and indicates the relative importance of specific data in a simulation. Section III gives details of some of the additional physical quantities which must be defined before running TRANSP and some of the controls that are available to determine the way in which the data is used within the code. Section IV is a description of a full transport analysis of a typical JET H-mode shot. Section V contains conclusions and general remarks on transport analysis using TRANSP. (Author).

44215 (LA–11622-MS) **Electron temperature measurements of field-reversed configuration plasmas on the FRX-C/LSM experiment.** Rej, D.J. Los Alamos National Lab., NM (USA). Sep 1989. 46p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. Order Number DE89016187/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

A single-point Thomson scattering diagnostic is used to determine the electron temperature T_e of field-reversed-configuration (FRC) compact toroids generated in the θ-pinch source of the Los Alamos FRX-C/LSM experiment. Measurements are performed close to the axial midplane and near the magnetic and geometric axes. A broad range of plasma conditions is investigated and electron temperatures vary, on average, between 90 and 190 eV. For a given condition, T_e remains relatively constant during the 60 μs measurement interval between formation and the onset of the n = 2 rotational instability. T_e increases with plasma diameter and external magnetic field, and decreases slightly with fill pressure. The temperature at the geometric axis is consistently 10–20% lower than that near the field null. The temperature is approximately 35% higher than observed previously on the smaller FRX-C device. The implications of these measurements on plasma confinement properties are discussed. 25 refs., 18 figs., 8 tabs.

44216 (LA-UR–89-2474) **Observations of azimuthal asymmetry for certain FRC operating regimes.** Wright, B.; Barnes, D.; Chrien, R.; Crawford, E.; Milroy, R.; Okada, S.; Siemon, R.; Tuszewski, M.; Webster, R. Los Alamos National Lab., NM (USA). 1989. 3p. Sponsored by U.S. DOE Energy Research. DOE Contract W-7405-ENG-36. (CONF-8903100–4: 9. U.S. compact toroid symposium, Union. WA (USA), 14-15 Mar 1989). Order Number DE89015300/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The FRX-C/LSM experiment has been operated with additional diagnostics for studies of FRC structure in the θ-pinch source. Data were taken over ranges of fill pressure and bias field that lead to the formation of FRCs with confinement properties that are consistently good (e.g., at 3 mtorr at 0.7 kG bias) and consistently poor (e.g., at 5 mtorr at any bias). The pertinent diagnostics were end-on soft x-ray imaging, arrays of external B_θ and B_r probes, and five chords of interferometry. The data show that easily observed departures from azimuthal (θ) symmetry occur in some cases and that further research into the cause and nature of these asymmetries would benefit our studies of FRC stability and confinement. 4 refs.

44217 (LBL–26813) **Analytic theory of ICRF minority heating.** Ye, H.; Kaufman, A.N. Lawrence Berkeley Lab., CA (USA). Apr 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905120–22: 8. American Physical Society topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989). Order Number DE89015222/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We present a one-dimensional analytic theory of the ICRF gyroresonant absorption and mode-conversion, for the problem of minority fundamental resonance. Using the wave phase-space method, and the theory of linear mode conversion therein, we obtain explicit expressions for the coefficients of transmission (T), reflection (R), conversion (C), absorption (A). 7 refs., 2 figs.

44218 (LBL–27108) **Scattering of an ICRF magnetosonic wave by plasma density turbulence.** Cook, D.R.; Kaufman, A.N. Lawrence Berkeley Lab., CA (USA). Apr 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-76SF00098. (CONF-8905120–20: 8. American Physical Society topical conference on radio frequency power in plasmas, Irvine, CA (USA), 1-3 May 1989). Order Number DE89015223/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

A fast ICRF magnetosonic wave, launched into a tokamak plasma, scatters off turbulent density fluctuations in the plasma edge. We use cold-fluid theory to calculate the angular distribution of the scattered wave and find it to be predominantly perpendicular to the incident wavevector for second harmonic majority heating. We calculate the mean free path and find it to be large compared to the size of tokamak devices. Therefore, scattering of ICRF magnetosonic waves by density turbulence is an utterly negligible effect. 2 refs., 1 fig.

44219 (PPPL–2640) **The effect of ICRF antenna phasing on metal impurities in TFTR.** Stevens, J.E.; Bush, C.; Colestock, P.L.; Greene, G.J.; Hill, K.W.; Hosea, J.C.; Phillips, C.K.; Stratton, B.; von Goeler, S.; Wilson, J.R.; Gardner, W.; Hoffman, D.; Lysojvan, A. Princeton Univ., NJ (USA). Plasma Physics Lab. Jul 1989. 17p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03073. Order Number DE89014009/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

ICRF power levels of up to 2.8 MW were achieved during the 1988 experimental run on TFTR. Metal impurity concentrations (Ti, Cr, Fe, Ni) and Z_{eff} were monitored during ICRF heating by x-ray pulse height analysis and uv spectroscopy. Antenna phasing was the key variable affecting ICRF performance. No increase in metallic impurities was observed for $P_{rf} \lesssim 2.8$ MW with the antenna straps 0-Π, while a measurable increase in titanium (Faraday screen material) was observed for $P_{rf} \gtrsim 1.0$ MW with 0-0 phasing. 18 refs., 8 figs.

44220 (UCID–21636) **Simultaneous multiple frequency interferometry: An application of homodyne phase measurement.** Bolton, P.R. Lawrence Livermore National Lab., CA (USA). 1 May 1989. 19p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89013975/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Microwave interferometry of plasmas involving only multiple homodyne phase measurement is considered in the limits of very low and very high collisionality. Starting with an assumed Langevin model of a weakly ionized gaseous plasma the expressions for the complex propagation constant(s) of probe(s) are simplified for these limiting cases. Emphasis is on the imaginary component of the propagation constant which accounts for the phase shifting phenomena. Simultaneous use of two probing frequencies enables phase determination of both the time-dependent electron density and 'effective' collision rate which are line-integrated along the probe propagation length. Extension to a triple frequency interferrometric system allows additional determination of the line-integrated square of the electron density due to the incorporation of higher order terms in a Taylor series expansion. If a reasonable functional form for the longitudinal variation in plasma density is assumed, the plasma spatial profile can then be estimated. Throughout, plasmas are assumed to be transversely uniform. In addition, physical interpretation of a real 'effective' collision rate can be simplified in these collisional limits to be directly proportional to an energy distribution averaged momentum transfer rate. 8 refs., 1 fig.

44221 (UCRL–21188) **Generation of $(3/2)\omega_0$ radiation in inhomogeneous plasmas under the irradiation of intense electromagnetic waves: Final report, April 3, 1987–September 30, 1988.** Wong, A.Y.; Bauer, B.S. Lawrence Livermore National Lab., CA (USA); California Univ., Los Angeles, CA (USA). Dept. of Physics. Feb 1989. 116p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. Order Number DE89015723/JAW. Available from NTIS, PC A06/MF A01 - OSTI; GPO Dep.

We have investigated several phenomena of importance to laser-plasma interactions that are associated with cavitons generated at the critical layer of a nonuniform plasma by resonant absorption of intense electromagnetic radiation. The emission, from deep cavitons, of electromagnetic radiation at half-harmonics of the pump frequency, has been examined. Caviton formation has been shown to be most efficient for shallow density gradients at the critical layer. Huge electron plasma waves, with attendant wave-breaking and energetic particle production, have been generated. Experimental results are consistent with LLNL and UCLA computer simulations.

44222 Research opportunities below 300 nm at the NBS free-electron laser facility. Debenham, P.H. (9500984); Johnson, B.C. vp. of Free-electron laser applications in the ultraviolet. Optical Society of America, Washington, DC (1988). (CONF-880318–: Topical meeting on free-electron laser applications in the ultraviolet, Cloudcroft, NM (USA), 2-5 Mar 1988).

A free-electron laser (FEL) user facility is being constructed at the Center for Radiation Research of the National Bureau of Standards in collaboration with the Plasma Physics Division of the Naval Research Laboratory. The FEL, which is driven by the NBS-LANL cw racetrack microtron (RTM), is operated as an oscillator with the fundamental wavelength variable from approximately 200 nm to 10 μm. The presence of harmonics should allow for operation in the VUV and EUV spectral regions. The NBS-LANL cw RTM consists of a 5 MeV injector section and a 12 MeV, cw, rf linear accelerator (linac). The linac is placed between two uniform-field end magnets that recirculate the beam on successive orbits through the linac. The beam can be deflected out of the RTM after completing up to and including 15 passes through the linac, so that the final beam energy is 17 MeV to 185 MeV.

44223 Whistler-mode electron cyclotron emission from the Phaedrus-B end cell. Cui, B. (9525160); Probert, P.H.; Brooker, P.D.; Nonn, P.D.; Keil, D.L.; Hershkowitz, N.; Majeski, R.P.; Breun, R.A.; Ellis, R.F. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(1): 34-40 (Feb 1989).

Measurements of whistler-mode electron cyclotron emission have been made in the Phaedrus-B tandem mirror end cell. The receiving horn was located on the axis of the machine just outboard of the end cell. Under normal conditions, the signal had a component which was identified as blackbody emission, and an electron temperature was obtained which was in good agreement with electron end loss energy-analyzer data. In addition, the signal contained short bursts of unknown origin. Significant heating of the electrons due to end-cell ICRF was seen. Comparison of end loss and Thomson scattering data showed that emission from hotter edge electrons was responsible for a large part of the total signal.

44224 Electron temperatures of intense electron-beam-produced plasmas. Brake, M.L. (4142000); Repetti, T.E. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(1): 60-61 (Feb 1989).

A method of estimating the electron temperatures in intense, relativistic, electron-beam-produced plasmas is presented. This method compares spectral line intensities obtained from visible emission spectroscopy to those expected from LTE plasmas. The line intensities, however, particularly those originating from highly excited states, are corrected dor the effects of the fast beam electrons.

44225 Ray tracing study of the electron cyclotron current drive in DIII-D using 60 GHz. Matsuda, K. (9524084). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(1): 6-11 (Feb 1989).

The efficiency of the electron cyclotron current drive using 60 GHz sources in the DIII-D tokamak has been numerically investigated for the following cases: The inside-launched fundamental extraordinary mode, the outside-launched fundamental ordinary mode, and the outside-launched second harmonic extraordinary mode. In the limit-weak ECH power and for plasma parameters relevant for experiments, illumination of the plasma with inside-launched fundamental extraordinary mode is found to have the highest efficiency.

44226 Experimental study of CF_4 conical theta pinch plasma expanding into vacuum. Pedrow, P.D. (9500381); Nasiruddin, A.M. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(1): 17-23 (Feb 1989).

Langmuir probe, photodiode, and optical multichannel analyzer (OMA) measurements have been made on a pulsed CF_4 conical theta pinch plasma. A cloud of CF_4 gas was puffed into a conical theta pinch coil, converted to plasma, and propelled into the vacuum region ahead of the expanding gas cloud. At a position 67 cm away from the conical theta pinch coil, the plasma arrived in separate packets that were about 20 μs in duration. The average drift velocity of these packets corresponded to an energy of about 3 eV. The OMA measurements showed that the second packet contained neutral atomic fluorine as well as charged particles.

44227 Summary of the National Aeronautics and Space Administration Lunar Helium-3/Fusion Power Workshop, Cleveland, Ohio, April 25-26, 1988. Epstein, G.L. (Congress of the United States Office of Technology Assessment, Washington, DC (US)); Plescia, J.B.; Gabris, E.A. *Fusion Technology (USA),* 15(1): 67-77 (Jan 1989).

The National Aeronautics and Space Administration (NASA) Lunar Helium-3/Fusion Power Workshop was held April 25-26, 1988, in Cleveland, Ohio, to discuss the feasibility of mining ^{3}He from the lunar regolith for use in terrestrial fusion applications, which was said to offer an economic payoff for space missions. The development of the moon as a source of materials for use on earth is being studied by NASA's Office of Exploration as a potential next step in extending human presence into the solar system. The discovery in 1985 of useful quantities of ^{3}He on the moon makes this assessment particularly timely. Forty-five experts from the nuclear fusion,

mining, and lunar communities participated. An overview of mining ^{3}He from the moon and two applications concepts were presented at the opening session of the workshop.

44228 Recycling and neutral transport in the DIII-D tokamak. Allen, S.L. (Lawrence Livermore National Lab., CA (USA)); Rensink, M.E.; Hill, D.N.; Perkins, D.E.; Jackson, G.L.; Ali Mahdavi, M. DIII-D Research Team. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 162-164: 164 (Apr 1989). DOE Contract W-7405-ENG-48;AC03-84ER51044. (CONF-8805285–: 8. international conference on plasma surface interactions in controlled fusion devices (PSI-8), 2-6 May 1988).

Also published as report GA-A–19292; CONF-880512–7.

Several diagnostics have been used to characterize the edge plasma in the DIII-D divertor region and thereby to understand the particle recycling and neutral particle transport in an open divertor. An array of Langmuir probes mounted on the carbon divertor plates determines that generally the electron temperature is low ($T_e \simeq$10-20 eV), and the electron density is high ($n_e \simeq 5x10^{19}$ m^{-3}). The edge plasma temperature and density are also measured by a moveable Langmuir probe mounted at the midplane of the plasma; the data from these shot-by-shot edge radial scans are then connected with the data for the core plasma obtained by Thomson scattering. The heat flux to the divertor plates is measured by an absolutely calibrated infrared camera; a plasma model is used to compare the heat flux with the measured T_e and n_e. The molecular neutral pressure at the edge of the plasma at several poloidal and toroidal locations is obtained from absolutely-calibrated pressure gauges; a gas puff enables in-situ gauge calibrations before each plasma shot. Typically, the divertor pressure is 10-50 times larger than that at the midplane. Time-resolved H_α brightness measurements are obtained from an absolutely calibrated television camera viewing the divertor region from above; both strike points are viewed simultaneously. The emission from the inner and outer strike points are usually equal after the H-mode transition, but are often unequal after the first ELM in H-mode and during some phases of L-mode discharges. A tangential camera measures the falloff in emission from the X-point to the plasma midplane. (orig./KP).

44229 Boundary asymmetries and plasma flow to the ALT-II toroidal belt pump limiter. Corbett, W.J. (California Univ., Los Angeles, CA (USA). Inst. of Plasma and Fusion Research); Goebel, D.M.; Conn, R.W.; McGrath, R.T.; Dippel, K.H.; Finken, K.H. *Journal of Nuclear Materials, on Metallurgy, Ceramics and Solid State Physics in the Nuclear Energy Industry (Netherlands),* 162-164: 164 (Apr 1989). DOE Contract FG03-85ER51069. (CONF-8805285–:).

The ALT-II toroidal belt pump limiter is constructed with 8 radially adjustable limiter blade segments located 45^0 below the outboard horizontal midplane of TEXTOR. An array of Langmuir probes installed in the plasma scoops measures the total ion current to each neutralizer plate, including asymmetries in flow incident from above and below the belt. Recent measurements indicate that 10-50% more current is collected by neutralizers with flux tubes connecting to the electron drift side, on the outboard side of ALT-II. The source of the particle collection asymmetry is deduced from profile measurements in the scrape-off layer (SOL). On the outboard midplane, a scanning double probe measures λ_n=1.4 cm, while profiles obtained with a Li-beam diagnostic located at the bottom of TEXTOR show λ_n=0.9 cm. The primary source of the asymmetric particle collection at the neutralizers is therefore the difference between e-folding lengths on the electron and ion drift sides. During ohmic discharges, the electron temperature in the center of the scoops (3 cm into SOL) is 8-12 eV, tending to decrease with rising line average density in the core. Corresponding edge plasma densities are in the range (2-5)x10^{11} cm^{-3}. In this paper, we report on measurements in the SOL behind ALT-II to emphasize the role of asymmetric decay lengths on particle collection by the ALT-II toroidal belt pump limiter. (orig.).

44230 Armature formation in a railgun using a two-stage light-gas gun injector. Hawke, R.S. (9513035); Susoeff, A.R.; Asay, J.R.; Hall, C.A.; Konrad, C.H.; Hickman, R.J.; Sauve, J.L. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(3): 378-385 (Jun 1989).

During the past decade several research groups have tried to achieve reliable acceleration of projectiles to velocities in excess of 8 km/s by using a railgun. All attempts have met with difficulties. However, in the past four years the researchers have come to agree on the nature and causes of the difficulties. The consensus is that the hot plasma armature - used to commutate across the rails and to accelerate the projectile - causes ablation of the barrel wall; this ablation ultimately results in parasitic secondary arc formation through armature separation and/or restrike. The subsequence deprivation of current to the propulsion armature results in a limit to the achievable projectile velocity. Methods of mitigating the process are under study. One method uses a two-stage light-gas gun as a preaccelerator/injector to the railgun. The gas gun serves a double purpose: It quickly accelerates the projectile to a high velocity, and it fills the barrel behind the propulsive armature with insulating gas. While this approach is expected to improve railgun performance, it also requires development of techniques to form the propulsive armature behind the projectile in the high-velocity, high-pressure gas stream. This paper briefly summarizes the problems encountered in attempts to achieve hypervelocities with a railgun. Included is a description of the phenomenology and details of joint Sandia National Laboratories, Albuquerque/Lawrence Livermore National Laboratory (SNLA/LNLL) work at SNLA on a method for forming the needed plasma armature.

44231 Operating characteristics and modeling of the LLNL 100-kV electric gun. Osher, J.E. (9513035); Barnes, G.; Chau, H.H.; Lee, R.S.; Lee, C.; Speer, R.; Weingart, R.C. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(3): 392-402 (Jun 1989).

In the electric gun, the explosion of an electrically heated metal foil and the accompanying magnetic forces drive a thin flyer plate up a short barrel. Flyer velocities of up to 18 km/s make the gun useful for hypervelocity impact studies. The authors briefly review the technological evolution of the exploding-metal circuit elements that power the gun, describe the 100-kV electric gun designed at Lawrence Livermore National Laboratory (LLNL) in some detail, and present the general principles of electric gun operation. They compare the experimental performance of the LLNL gun with a simple model and with predictions of a magnetohydrodynamics code.

44232 Computer-based on-line pulsed ionization chamber plasma diagnostic system. Choi, W.Y. (Univ. of Florida, Gainesville (USA)); Park, J.S.; Baumgartner, M.J.; Ellis, W.H. *Transactions of the American Nuclear Society (USA),* 57: 306-308 (1988). (CONF-881011–: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

A pulsed ionization chamber (PIC) plasma diagnostic system described previously for use in the study of ionized gas kinetics for rare gases and their mixtures including He(UF_6)-a candidate gas core reactor/magnetohydrodynamic (MHD) converter working fluid and a component in wide range radiation field measurement systems has been upgraded in performance to include computer-controlled data acquisition, storage, processing, graphic analysis, and presentation. The current automated system, whose performance is being reported and whose block diagram is shown, is developed around a Macintosh SE microcomputer, IEEE-488 (GPIB) instruments, and a National Instruments interface controller. The results shown not only demonstrate the improved wide-range voltage signal measurement capability of the new PIC system (e.g., from millivolts to tens of volts) but also illustrate the system's capability of easily producing print-ready graphics of experimental data. From automation to report preparation, the new system promises to greatly facilitate the overall process of our experimental plasma diagnostic program and should aid in the implementation in our study of a series of gas core reactor fuel gas/MHD converter working fluids.

44233 Magnetic-probe diagnostics for railgun plasma armatures. Parker, J.V. (9512470). *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(1): 487-500 (Jun 1989).

Magnetic probes were employed on the first plasma armature railgun experiments, and they have been used continuously since then for position determination and qualitative determination of the armature current. In the last few years, improvements in experimental

technique and analysis have permitted more accurate measurements of the plasma-armature current distribution. This paper reviews the various probe configurations in use today and presents analytic approximations for the dependence of the probe signal on probe location and railgun geometry. Rail current and armature current probes are compared and contrasted with respect to resolution and accuracy. Further improvements in measurement accuracy are predicted for close-spaced magnetic-probe arrays.

44234 Ion thermal confinement in the enhanced-confinement regime of the TFTR tokamak. Fonck, R. J. (Princeton Plasma Physics Laboratory, Princeton, New Jersey 08543 (US)); Howell, R.; Jaehnig, K.; Roquemore, L.; Schilling, G.; Scott, S.; Zarnstorff, M. C.; Bush, C.; Goldston, R.; Hsuan, H.; and others. *Physical Review Letters (USA),* 63(5): 520-523 (31 Jul 1989). DOE Contract AC02-76CH03073.

Central ion temperatures up to 30 keV and rotation speeds up to 8×10^5 m/sec have been confirmed with new diagnostic measurements in the TFTR hot-ion enhanced-confinement regime, and the ion thermal diffusivity is found to be non-neoclassical and comparable to the anomalous electron thermal diffusivity. The dominant effect of strong rotation is the down-shifting of the neutral beam energies in the plasma frame, which results in reduced ion and electron heating on axis, and the presence of off-axis ion heating from viscous damping of the plasma rotation.

44235 Warm plasma dispersion relation of the fast Alfven wave for asymmetrical heating current drive. Gahl, J.M. (9523873); Hagler, M.O.; Kristiansen, M. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(3): 520-523 (Jun 1989).

Experimental observation of current drive by asymmetrical heating of ions in the Texas Tech Tokamak suggests that penetration of the fast Alfven wave near the fundamental ion-cyclotron resonance is restricted. The numerical study of the warm plasma dispersion relation near the ion-cyclotron resonance does indeed show this effect. The study reveals that as the wave approaches the resonant layer from the high or low field side of the torus, it first passes through a region where asymmetrical heating takes place and the wave energy is absorbed by ions moving with high velocity parallel to the magnetic field.

44236 Quasilinear ballooning mode saturation. Riedel, K. S. (Courant Institute of Mathematical Sciences, New York University, New York, New York 10012 (US)). *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1780-1787 (Sep 1989).

At small amplitudes, resistive ballooning modes form a quasilinear sheet current, which opposes the magnetic flux reconnection. In the ensuing Rutherford regime [Phys. Fluids **16**, 1903 (1973)] the sheet current at each resonance surface decays. To remain in a quasistatic equilibrium, magnetic islands form and thereby flatten the pressure at each resonance surface. For local instabilities, a spectrum of modes are excited, each flattening the pressure gradient at its resonance surface. The resulting averaged quasilinear pressure profile has a Cantor setlike structure. Using the equivalence of harmonics, the calculation of the saturated amplitudes is reformulated as a nonlinear eigenvalue problem of an integral differential equation with the quasimode formalism.

44237 Self-adjoint formulation of plasma heating in the ion-cyclotron range of frequencies. Romero, H. (Department of Physics, University of California, Los Angeles, California 90024-1547 (US)); Morales, G. J. *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1805-1810 (Sep 1989).

It is shown that second-order (ρ/L) corrections in the expression for the equilibrium distribution function are required to obtain a self-adjoint system of equations for ion cyclotron range of frequencies (ICRF) wave propagation in a nonuniform plasma (ρ denotes the ion-Larmor radius and L the gradient scale length). Self-adjointness results in energy conservation in the absence of absorption mechanisms, as expected. A Lagrangian density is obtained, which yields both the wave operator and its adjoint, and directly results in the conservation law of the truncated system.

44238 The effect of low-frequency turbulence on flux, particle, and energy confinement in a field-reversed configuration. Krall, N. A. (Krall Associates, Del Mar, California 92014 (US)). *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1811-1817 (Sep 1989).

A recent stability calculation solved the dispersion matrix to find three distinct unstable modes in three distinct regions of the field-reversed configuration (FRC). In the present work the transport produced by these three low-frequency modes is calculated, and both global transport scaling estimates and local transport coefficients are obtained. The result is that low-frequency drift wave transport agrees with most present experimental measurements of particle, flux, and energy loss both in terms of magnitude and scaling, becoming less dominant as the collision frequency decreases.

44239 Wave propagation in the ion cyclotron range of frequencies through the turbulent edge. Thayer, D. R. (Lawrence Berkeley Laboratory, University of California, Berkeley, California 94720 (US)). *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1818-1826 (Sep 1989).

It is pointed out that the turbulent tokamak edge can significantly affect the transmission of a wave in the ion cyclotron range of frequencies during auxiliary heating at the resonant layer. Because of the large edge density fluctuations, it is necessary to consider an order unity expansion parameter for the general propagator theory of wave propagation. Consequently, a renormalized theory for the scattering process is developed and utilized to determine the backscattering (one dimensional) and spectral wavenumber spread (two dimensional) of incident energy.

44240 Results of counterneutral beam injection on the DIII-D tokamak. Schissel, D. P. (General Atomics, San Diego, California 92138 (US)); Allen, S. L.; Burrell, K. H.; DeBoo, J. C.; Groebner, R. J.; Kellman, A. G.; Ohyabu, N.; Petersen, P. I.; Sager, G. T.; Snider, R. T.; and others. *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1843-1849 (Sep 1989).

Limiter, single-null, and double-null divertor plasmas have been heated by hydrogen neutral beam injection in the direction opposite to that of the plasma current. The H-mode power threshold is reduced by approximately 25% for counterinjection. Sawtooth suppression was possible only for high neutral beam power and for high values of the safety factor. No confinement improvement over similar coinjection discharges was observed in H-mode, L-mode, or limiter discharges. In plasmas without sawteeth, metallic impurity buildup in the central region of the plasma eventually leads to a reduction in confinement. The parametric dependence of energy confinement for both L-and H-mode plasmas was found to behave in the same manner during similar coinjection experiments. H-mode confinement increased linearly with increasing plasma current (65 msec/MA at 9 MW). Both L-mode and H-mode energy confinement decreased with increasing neutral beam power. At 1.25 MA, the L-mode plasmas had a confinement time that was less than that predicted by Kaye–Goldston scaling.

44241 Evidence for the modification of half-harmonic spectral shifts by plasma flow. Gabl, E. F. (KMS Fusion, P.O. Box 1567, Ann Arbor, Michigan 48106 (US)); Berger, R. L.; Busch, G. E.; Campbell, P. M.; Schroeder, R. J.; Shepard, C. L.; Tarvin, J. A. *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1850-1854 (Sep 1989).

The (3)/(2) ω_0 harmonic emission has been observed from a laser-produced plasma using exploding foil targets illuminated by 1.053 μm laser light with a 300 psec square pulse. The shift of the measured wavelength from (2)/(3) λ_0 is found to depend markedly on the target thickness. Variation of the flow velocity and thus the Doppler shifts of the wave frequency with target thickness is found to be more important than variation of the electron temperature. Adjusting the measured wavelength by Doppler shifts calculated with flow velocities from simulations brings the measurements from different target thicknesses into agreement. These results indicate that previous predictions of electron temperatures from analyses of half-harmonic spectra from inertial confinement fusion plasmas are up to a factor of 2 too small.

44242 Propagation of a Gaussian beam in a nonhomogeneous plasma. Mazzucato, E. (Plasma Physics Laboratory, Princeton University, Princeton, New Jersey 08543 (US)). *Physics of Fluids B: Plasma Physics (USA),* 1(9): 1855-1859 (Sep 1989).

The asymptotic theory of Choudhary and Felsen [IEEE Trans. Antennas Propag. **AP-21**, 827 (1973)] on the propagation of scalar inhomogeneous waves in two-dimensional isotropic media is extended to the case of three-dimensional vector fields. The theory is applied to the propagation of Gaussian beams in nonhomogeneous media. The wave trajectory equations are then reformulated for anisotropic media and used for tracking a Gaussian beam in a tokamak plasma.

44243 Observation of enhanced x-ray emission from long-pulse-width laser-produced plasmas. Ze, F. (Lawrence Livermore National Laboratory, University of California, Livermore, California 94550 (US)); Kania, D. R.; Langer, S. H.; Kornblum, H.; Kauffman, R.; Kilkenny, J.; Campbell, E. M.; Tietbohl, G. *Journal of Applied Physics (USA)*, 66(5): 1935-1939 (1 Sep 1989). DOE Contract W-7405-ENG-48.

Experiments investigating the pulse-width dependence of thermal x-ray conversion efficiencies ($h\nu$<1.5 keV) in laser-heated gold plasmas are described. The results show that the instantaneous ratio of the emitted x-ray flux to the laser energy deposition rate increases throughout a 4-ns laser pulse. The studies were carried out using single arms of the 10-beam Nova laser facility. The irradiance was ~4–5x10^{14} W/cm^2 in the target plane as we varied the laser pulses' FWHM from 2 to 4 ns. The laser pulses were nominally flat-topped and contained between 1 and 2 kJ of (1)/(3) μm light. Time-resolved plasma radiation was monitored with a broadband, streaked x-ray spectrograph that has a roughly 30-ps time resolution and channels that are roughly 100–150 eV wide. One-dimensional numerical models run with the lasnex code produce a conversion efficiency that is nearly constant throughout the laser pulse. We discuss various approximations made in the one-dimensional models and conclude that none of them are a likely explanations for the increase of conversion efficiency with time. A preliminary two-dimensional model of a disk heated by a 3-ns pulse shows that the conversion efficiency increases throughout the pulse. The increase is due to soft x rays emitted from outside the laser spot. Further experiments and modeling will be carried out to assess these two-dimensional effects.

44244 Anomalous particle pinch for collisionless plasma. Terry, P. W. (Department of Physics, University of Wisconsin Madison, Madison, Wisconsin 53706 (US)). *Physics of Fluids B: Plasma Physics (USA)*, 1(9): 1932-1934 (Sep 1989).

The particle transport arising from the convection of nonadiabatic electron density by ion temperature gradient driven turbulence is examined for trapped electron collisionality regimes. In the lower temperature end of this regime, trapped electrons are collisional and the particle flux is outward (in the direction of the gradients). When the trapped electrons are collisionless, there is a temperature threshold above which the electron temperature gradient driven particle flux changes sign and becomes inward. The magnitude of the nonadiabatic electron contribution to the growth rate is found to be potentially of the same order as the ion contribution.

44245 Note on detailed models for trapped electron transport in tokamaks. Waltz, R. E. (General Atomics, San Diego, California 92138-5608 (US)); Dominguez, R. R. *Physics of Fluids B: Plasma Physics (USA)*, 1(9): 1935-1937 (Sep 1989).

Detailed quasilinear trapped electron transport expressions are compared with the simple scaling forms of the extreme dissipative regime used in recent modeling studies. The problem of obtaining a consistent plasma pinch in the dissipative regime is discussed.

44246 (AD-A–206908/6/XAB) **Quantitative spectroscopy of x-ray laser plasmas in pulsed power. Annual progress report, April 1988-March 1989.** Maryland Univ., College Park, MD (USA). Lab. for Plasma and Fusion Energy Studies. Mar 1989. 3p. Available from NTIS, PC A02/MF A01.

At the start of the reporting period, the original Z -pinch setup was in place and running. Diagnostics consisting of a framing camera, 1 m N.I. VUV spectrometer, 1/2-m visible spectrometer and a Rogowski coil had been set up and were functional. To begin, with a framing camera a study of the visible signature of the plasma for a variety of different conditions (e.g., gas voltage in discharge, etc.) was conducted. This gave a working understanding of the gross behavior of the discharge. The emphasis was shifted to obtaining a temporal sequence of time-resolved photographic spectra which would include the 5f-3d and 4f-3d transitions in C IV, the lines of primary interest for this experiment. Preliminary steps, such as checking the calibration of the 1-m VUV spectrometer/MCP/photographic film with an Ar capillary discharge lamp, and the location of optimal discharge conditions/MCP pulse parameters/photographic film development procedures, were conducted.

44247 (AECL–8405) **Organic coolants and their applications to fusion reactors.** Gierszewski, P.; Hollies, B. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Aug 1986. 69p. Order Number DE89634483/JAW. Available from NTIS (US Sales Only), PC A04/MF A01 - OSTI; INIS.

Organic coolants offer a unique set of characteristics for fusion applications. Their advantages include high-temperature (670 K or 400 degrees C) but low-pressure (2 MPa) operation, limited reactivity with lithium and lithium-lead, reduced corrosion and activation, good heat-transfer capabilities, no magnetohydrodynamic (MHD) effects, and an operating temperature range that extends to room temperature. The major disadvantages are decomposition and flammability. However, organic coolants have been extensively studied in Canada, including nineteen years with an operating 60-MW organic-cooled reactor. Proper attention to design and coolant chemistry controlled these potential problems to acceptable levels. This experience provides an extensive data base for design under fusion conditions. The organic fluid characteristics are described in sufficient detail to allow fusion system designers to evaluate organic coolants for specific applications. To illustrate and assess the potential applications, analyses are presented for organic-cooled blankets, first walls, high heat flux components and thermal power cycles. Designs are identified that take advantage of organic coolant features, yet have fluid decomposition related costs that are a small fraction of the overall cost of electricity. For example, organic-cooled first walls make lithium/ferritic steel blankets possible in high-field, high-surface-heat-flux tokamaks, and organic-cooled limiters (up to about 8 MW/m^2 surface heating) are a safer alternative to water cooling for liquid metal blanket concept. Organics can also be used in intermediate heat exchanger loops to provide efficient heat transfer with low reactivity and a large tritium barrier. 55 refs.

44248 (AECL–9389) **Laser plasma beatwave accelerator experiment.** Ebrahim, N.A. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Mar 1987. 25p. Order Number DE89634492/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

An experiment to test the laser plasma beatware accelerator concept is outlined. A heuristic estimate of the relevant experimental parameters is obtained from fluid theory and considerations of wave-particle interactions. Acceleration of 10 MeV electrons to approximately 70 MeV over a plasma length of 3 cm appears to be feasible. This corresponds to an accelerating gradient of approximately 2.5 GeV/m.

This report describes progress achieved on a laser development program, the goal of which has been to establish a first generation short wavelength KrF laser facility capable of delivering nominally 20 J in 5 ns pulses for inertial confinement fusion research at irradiation intensity levels up to 5 x 10^{13} watts/cm^2. The KrF discharge laser front end is a subsystem utilizing a multi-etalon contolled master oscillator with 3 amplifiers. A portion of the output is used to laser trigger the high voltage switches on the A-amplifer, a second

portion to generate a pulse used for extraction of the A-amplifier and eventual pulse stacking, and a final portion to generate a Stokes shifted optical pulse in methane and for subsequent pulse in methane and for subsequent pulse shaping. The resulting pulse is used to seed the Raman compressor. Here the short seed pulse is counterpropagated with the stacked output of the A-amplifier in a final methane cell. By stimulated backward Raman scattering the energy from the A-amplifier is transferred to the short Stokes shifted seed pulse. The nominally 20 J, 5 ns output pulse will then be directed to the target chamber. A number of system up-grades have been incorporated, and a variety of issues related to front-end system performance have been studied, including beam polarization and temporal modulation effects, optical coatings and damage thresholds, dichroic mirrors, data acquisition and analysis. Fabrication, assembly and testing of the electron-beam pumped A-amplifier has been achieved during this year. This unit is the heart of the high energy laser output and so has received the greatest attention. Finally, extensive measurements have been made on Raman pulse generation and amplification. 21 figs., 33

44250 (CEA-CONF–9689) **Two-dimensional numerical simulations of laser irradiated targets.** Mucchielli, F.; Colin Verdiere, G. de; Galmiche, D. and others. CEA Centre d'Etudes de Limeil, 94 - Villeneuve-Saint-Georges (France). 1988. 10p. (CONF-881015–: 12. international conference on plasma physics and controlled nuclear fusion research, Nice (France), 12-19 Oct 1988; IAEA-CN–50-B-4-8). Order Number DE89903177/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

We present numerical simulations of strongly two-dimensional laser experiments. First, it is concerned to restitute the direct driven implosion of microballoons irradiated with the two beams of Phebus laser facility at 0.53 μm wavelength and 3.2 TW power. In the second experiment, we study the impact between two foils. The accelerated foil is irradiated at 0,35 μm wavelength with a power of 20 GW. The numerical simulations are realized with the two - dimensional lagrangian FCI 2 code. The X-ray diagnostics are simulated with the DXFCI 2 code. In spite of numerical difficulties, principally close to the laser axis and the target interfaces, calculations have been carried out for a sufficient long time to provide results in accordance with the experiment. A simulation of the implosion of 600 μm in diameter microballoons made with an absorption rate of 40 % provides a neutron yield as well as X-ray emission peaks in agreement with the experiment. In the plane target case, it is shown that, for 80 μm in diameter focal spot, the 2D effects occurring in the acceleration of the foils influence in a preponderant way the energy transfer between these two foils.

44251 (CFFTP-B–86017) **Flux and energy dependence of methane production from graphite due to H^+ impact.** Davis, J.W.; Haasz, A.A.; Stangeby, P.C. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Jun 1986. 17p. Order Number DE89634455/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Carbon is in widespread use for limiter surfaces, as well as first wall coatings in current tokamaks. Chemical erosion via methane formation, due to energetic H^+ impact, is expected to contribute to the total erosion rate of carbon from these surfaces. Experimental results are presented for the methane yield from pyrolytic graphite due to H^+ exposure, using a mass analyzed ion beam. H^+ energies of 0.1-3 keV and flux densities of $\sim 5x10^{13}$ to 10^{16} H^+/cm^2s were used. The measured methane yield (CH_4/H^+) initially increases with flux density, then reaches a maximum, which is followed by a gradual decrease. The magnitude of the maximum yield and the flux density at which it occurs depends on the graphite temperature. The yields obtained at temperatures corresponding to yield maxima at specific flux densities also show an initial increase, followed by a shallow maximum and a gradual decrease as a function of flux density; the maximum occurs at $\sim 10^{15}$ H^+/cm^2s. Also presented are results on the methane production dependence on ion energy over the range 0.1 to 3 keV, and graphite temperature dependence measurements.

44252 (CFFTP-B–86019) **Pyrolitic graphite: inherent h-content and trapping of sub-eV D^O atoms.** Beutler, R.; Haasz, A.A.; Stangeby, P.C. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Jun 1986. 15p. Order Number DE89634494/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Inherent hydrogen concentrations in the near-surface region of pyrolytic graphite were measured, using Laser Release Analysis (involving laser-induced heating of the sample coupled with mass spectrometry for the analysis of released gases), for pyrolytic graphite previously baked in an UHV system at temperatures ranging from 500K to 2400K. After 24 hour bakeout at 500K, near-surface (~ 1 μm) hydrogen concentrations were measured to be $\sim 2x10^{16}$ - $4x10^{17}$ H/cm^2. These levels were reduced by 3-4 orders of magnitude following bakeout at 2200K-2400K. The effect of atmospheric exposure following bakeout on the near-surface H-concentration was investigated. Results are also presented on the deuterium uptake behaviour of pyrolytic graphite under sub-eV D^O exposure for various prior bakeout temperatures.

44253 (CFFTP-G–86040) **Tritium profiling in solids using the T(d, ^{4}He)n reaction.** Caterini, M.F. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Mar 1986. 195p. Order Number DE89634456/JAW. Available from NTIS (US Sales Only), PC A09/MF A01 - OSTI; INIS.

The T(d, ^{4}He)n reaction provides a quantitative, non destructive technique for measuring the depth distribution of tritium in prospective first wall materials over depths to ~ 1 μm. Calculations have been undertaken to show how the depth resolution and detection sensitivity vary with experimental conditions. The best depth resolution is attained at an angle of incidence between 40 degrees and 60 degrees to the surface normal and an exit angle of 80 degrees to the surface normal. Results of calculations on the deuterium depth profiling technique using the D(^{3}He, ^{4}He)p reaction are shown for comparison. Assuming typical experimental conditions, for a silicon target a surface resolution of 0.03 μm is predicted, degrading to approximately 0.3 μm at a 1 μm depth. For a gold target, a resolution of 0.015 μm at the surface and 0.5 μm at a 0.5 μm depth is predicted. Experimental depth resolution curves have been obtained from a tritiated Ti thin film overlaid with gold films of various thicknesses. Misalignment of the deuteron beam with the target resulted in a systematic uncertainty in the profiling geometry. Accounting for this effect in the experimental calculations resulted in good agreement between theory and experiment. Also depth profiles have been obtained for a tritated Ti thin film and tritium implanted Si and graphite samples. Evidence suggests that sensitivities of 0.001 at.% can be attained.

44254 (EGG-FSP–8459) **Initial experimental investigation of the elemental volatility from steel alloys for fusion safety application.** Piet, S.J.; Neilson, R.M. Jr.; Smolik, G.R.; Reimann, G.A. EG and G Idaho, Inc., Idaho Falls, ID (USA). Apr 1989. 148p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. Order Number DE89016356/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

Oxidation-driven volatility tests for fusion steels are described and results analyzed. The combination of high temperatures and oxidizing conditions in fusion accidents could volatilize radiologically significant amounts of fusion structural radioactivity. Tests have been conducted in dry air with samples of the ferritic steel, HT-9, the nickel-based austenitic steel, PCA, and the manganese-based austenitic steel, AMCR-033. Some HT-9 tests, have been conducted in steam-argon mixtures, and some PCA tests have been conducted in ambient humidity air. Tests have generally been for 1, 5, or 20 h. Depending on the specific steel alloy, test temperatures have been 600, 800, 1000, 1200, 1300, and 1500°C (HT-9 only). The experimental program was originally intended only to determine the approximate level of severity of the problem and to identify the key elements. These questions have basically been answered for the steels. Oxidation-driven volatility must be considered to show that fusion safety accident objectives are met. Key elements in ferritic steels appear to be phosphorus and manganese isotopes. Key elements in austenitic steels appear to be manganese, iron, and molybdenum. Since there is currently inadequate knowledge to defend transport calculations, current accident assessments should not take credit for deposition within the confinement/containment building. On the other hand, the present volatility assessments do not include the possibility of mobilization (via spallation) of oxide

layers during transients. Future research should address these factors. 21 refs., 62 figs., 30 tabs.

44255 (EGG-M–89201) **Remarks for fusion power associates panel discussion: Fusion energy–The challenge and the vision.** Piet, S.J. EG and G Idaho, Inc., Idaho Falls, ID (USA). 1 Jun 1989. 4p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC07-76ID01570. (CONF-8906148–3: Fusion Power Associates annual meeting, Washington, DC (USA), 1-2 Jun 1989). Order Number DE89016217/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

This paper briefly discusses the use of fusion energy as a viable future energy source. (LSP)

44256 (ENEA-RT-FUS–87-33) **Non-intuitive result in potential classical theory (toroidal magnetic field calculations).** Lo Surdo, C. ENEA, Frascati (Italy). Centro Ricerche Energia. Jul 1988. 19p. (In Italian). Order Number DE89761842/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

With regard to toroidal magnetic field calculations, this report proposes a solution to the problem: partial derivative with respect to X < partial derivative of Phi with respect to X >, where <> means average w.r.t. y over Omega identical to open domain of IR to the power of 2, normal w.r.t. the y axis, and Phi is the fundamental solution to the Poisson equation, del squared Phi = 2 Pi Rho in Omega, for given Rho. The result turns out to be a fairly non-intuitive one.

44257 (ENEA-RT-FUS–88-03) **Winding pack and ENEA conductor in central vault of the toroidal field coils of NET-22B: stress analysis.** Della Corte, A.; Cerreta, R. ENEA, Frascati (Italy). Centro Ricerche Energia. Jun 1988. 16p. Order Number DE89761964/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Presented at the ABAQUS users' conference (Providence, 1-3 June 1988).

In the present paper the results of the stress analysis of the toroidal field coil and of the ENEA conductor for the NET (Next European Torus: a European machine for research on controlled thermonuclear fusion) are presented. The calculations were performed with the FEM code ABAQUS. The main goals were: (1) to calculate the stress acting on all the components of the conductor; and (2) to study the influence on the stress distribution of the friction coefficient between case and winding pack. In the paper the obtained results are discussed. Some conclusions are reached: (a) the stainless steel jacket is subjected everywhere to an acceptable stress; (b) the stress applied to the epoxy insulation and equivalent winding pack material is often beyond elastic limits; and (c) the friction coefficient plays a very important role.

44258 (ENEA-RT-FUS–88-08) **Tritium cycle of compact high-field tokamaks. Frascati (Italy) tokamak upgrade status report, November 1987.** Roccella, M.; Bonizzoni, G.; Chiesa, P.; Ghezzi, F.; Nassi, M.; Pavesi, U.; Amedeo, P.; Boschetti, G.; Giffanti, F.; Moriggio, A. ENEA, Frascati (Italy). Centro Ricerche Energia. Nov 1988. 62p. (In Italian). Order Number DE89761970/JAW. Available from NTIS (US Sales Only), PC A04/MF A01.

Contract ENEA-CNR 2202, Series 3.

Some theoretical results and the current status of the work on a prototype plant for the tritium cycle of compact high-field tokamaks (such as, Ignitor, CIT, etc.), using the SAES Getter St 707 getter material, are described in this report. The schematics and present status of the main subplants of the cycle are reported together with some experimental results demonstrating the possibility of utilizing the St 707 material to purify the inert atmosphere of the glove-boxes and the secondary containment of the double-containment metal canalization which is to eventually house the various parts of the plant. Finally, as an example, the FTU machine, under construction at ENEA Frascati, is taken as reference, and theoretical evaluations are given for the inventory, permeation and release of the tritium from the first wall and the thermal shields of such a tokamak.

44259 (GA-A–19536) **DIII-D Research Operations: Final report, November 1, 1983–October 31, 1988.** General Atomics Co., San Diego, CA (USA). May 1989. 169p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-84ER51044. Order Number DE89013999/JAW. Available from NTIS, PC A08/MF A01 - OSTI; GPO Dep.

This report summarizes Research Operations on the Doublet III and DIII-D tokamaks for the contract period November 1, 1983 to October 31, 1988. The General Atomics tokamak research program has strived to advance the understanding and bounds of tokamak physics. Research at General Atomics has emphasized plasma shaping and high beta operations. The expanded boundary divertor that was invented in Doublet III was capitalized on in the design of the DIII-D device. The DIII-D tokamak quickly demonstrated these high beta and enhanced confinement features of non-circular divertor geometry that have been adapted in next generation tokamak designs such as CIT and ITER. Particular topics discussed are: confinement; beta and stability; boundary physics; rf heating; current drive; diagnostics; vessel modification (FY84–FY85); commissioning of DIII-D (FY86); hardware development (FY87–FY88); FY88 operations; collaborative programs; quality assurance; planning and control; computer operations; and safety.

44260 (GA-A–19687) **DIII-D safety procedures and operational experience.** Petersen, P.I.; Savercool, R.L.; Taylor, P.L. General Atomics, San Diego, CA (USA). Jun 1989. 11p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER51114. (CONF-8904159–4: International Atomic Energy Agency fusion reactor safety meeting, Jackson, WY (USA), 4-7 Apr 1989). Order Number DE89015966/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

The DIII-D research tokamak, which has near reactor dimensions, has been operating for approximately ten years. The hazards at the facility include high voltages, high currents, cryogenics, radiation, and normal industrial hazards. Procedures have been developed for operating the device, minimizing both the hazards to personnel and the damage caused by equipment failures, and for logging of failures. The machine and the neutral beamlines have been operated in hydrogen and are now starting operation in deuterium to expand the machine capabilities to reactor relevant regimes. Deuterium operation creates a significant amount of neutrons and therefore a neutron shield is being built around the machine area to reduce personnel radiation to As Low As Reasonably Achievable (ALARA) and to keep radiation at the site boundary at or below a limit of 20 mrem per calendar year. Gamma radiation shielding walls have been in place since the initial machine construction. The safety procedures for the DIII-D facility will be outlined and the accident experience will be discussed together with the neutron radiation monitoring program being developed. 4 figs., 3 tabs.

44261 (GA-A–19693) **Helium glow wall conditioning of the DIII-D tokamak with large area graphite coverage.** Jackson, G.L.; Taylor, T.S.; Petersen, P.I.; Taylor, P.L. General Atomics, San Diego, CA (USA). May 1989. 12p. Sponsored by U.S. DOE Energy Research. DOE Contract AC03-89ER51114. (CONF-8904230–3: AVS topical conference on surface conditioning of vacuum systems, Los Angeles, CA (USA), 3-7 Apr 1989). Order Number DE89015216/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Helium glow wall conditioning (HeGWC) is the primary technique for conditioning the DIII-D walls which are composed of Inconel and graphite. Presently, 40% (31 m^2) of the DIII-D plasma facing surfaces consist of graphite tiles covering the inside, top, and bottom DIII-D walls which are the high heat flux surfaces for divertor and inside wall limiter discharges. HeGWC with $T_{wall} \leq 50°C$ is effective both in removing low Z impurities and desorbing hydrogenic particles from this large graphite "reservoir." The effective desorption of hydrogen species from the graphite has led to lower recycling and improved particle control during tokamak discharges. We will first discuss the DIII-D glow discharge apparatus, the characterization of the glow discharge, the dependence of particle removal rates on the glow parameters, particularly electrode voltage and the duration of the glow session, and the subsequent discharge particle balance. After installation of graphite tiles covering 40% of the first wall (prior coverage was 9%, primarily in the lower divertor region), previously successful discharge cleaning and wall conditioning techniques in hydrogen failed to give reproducible high-quality discharges. With HeGWC, H-mode discharges were again reproducibly obtained. The main advantages of HeGWC during this phase of initial conditioning

were: disruption recovery during tokamak operations by removal of impurities such as CO, and reduced fueling from the walls, allowing reproducible burnthrough and plasma density control. 13 refs., 6 figs.

44262 (IAE–4692/7) **Principles for construction and structure of the control system for the T-15 tokamak complex.** Tilinin, G.N.; Stavisskij, B.A.; Strelkov, V.S.; Ploskirev, G.N.; Shchedrov, V.M. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 28p. (In Russian). Order Number DE89632035/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Main principles for construction of the T-15 control system are reported. The operating conditions for tokamak and its engineering systems are described, duties and functions of technological function operators are specified. Ideas on the needed level of automation of control subsystems for technological systems and T-15 control system are presented. Functions for T-15 shift supervisor and its interrelations with technological system operators and a leading experimenter are determined in detail. 10 tabs.

44263 (IAEA-TECDOC–495) **Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.** International Atomic Energy Agency, Vienna (Austria). Feb 1989. 346p. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Descriptions of operation and maintenance of current tokamaks (TFTR, JET, JT-60) is discussed in the context of radioactivation resulting from thermonuclear reactions. Plans for future devices (NET, CIT, FGR) with respect to remote handling, maintenance, measurements, and robotics are discussed. Refs, figs and tabs.

44264 (IAEA-TECDOC–495, pp. 95-102) **CEA contribution to advanced robotics.** Rouyer, J.L. (CEA, 92 - Fontenay-aux-Roses (France). Unite de Genie Robotique Avance). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Due to development of nuclear energy in France, CEA has a long experience in nuclear robotics. It started from remote handling in hot cells and extended to inspections in nuclear reactors, intervention with vehicles, decommissioning of experimental plants, maintenance and intervention in reactors and reprocessing plants. Existing equipments, which are briefly described, show present status of performances for these applications. Research activities are going-on to develop this potential. Main aspects of recent advances in nuclear robotics are detailed to show that each application has some relevance with fusion remote handling needs. In this panel of activities, fusion would profit more directly from reprocessing and reactor maintenance studies, Computer Aided Teleoperation and advanced manipulators developments. But all the projects in nuclear and servicing robotics may have spin-offs for fusion and mention to Eureka projects will underline the necessity for European cooperation in this field. Finally, honor will be rendered to Jean Vertut who had from the first moment a real passion for fusion. (author). 3 refs, 4 figs, 2 tabs.

44265 (IAEA-TECDOC–495, pp. 11-23) **Maintenance concept for the TFTR.** Little, R. (Princeton Univ., NJ (USA). Plasma Physics Lab.). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

This paper provides an overview of the Tokamak Fusion Test Reactor (TFTR) plans for operation in the deuterium-tritium phase. The emphasis is on the engineering aspects of the plan and the integration of maintenance activities into the overall experimental program. The specific approaches taken by TFTR in shielding and manipulators are outlined. An attempt is made to point out the complexities inherent in the present generation of tokamak research when nuclear aspects become an additional feature. (author). 4 refs, 8 figs, 3 tabs.

44266 (IAEA-TECDOC–495, pp. 25-34) **Remote maintenance concepts for the compact ignition tokamak.** Davis, F.C. (Oak Ridge National Lab., TN (USA)); Hager, E.R. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Because deuterium-tritium fuel will be used in the Compact Ignition Tokamak (CIT), remote handling technology is needed to carry out some maintenance operations on the machine. In keeping with the compact, low-cost nature of CIT, remote maintenance is provided only for systems with the highest probability of failure. Remote operations include removing, repairing (if feasible), and replacing such components as thermal protection tiles on the first wall, radio-frequency (rf) heating modules, and diagnostic modules. For maintenance inside the vacuum vessel, major pieces of equipment under development include an articulated boom manipulator with servomanipulators, an inspection manipulator, and special tooling. For maintenance outside the cryostat, remote equipment includes a bridge-mounted manipulator system, equipment for decontamination and hot cell activities, and for handling and packaging solid radioactive waste. The conceptual design phase of the CIT project is nearing completion; research and development activities in support of the project include demonstrations of remote maintenance operations on full-size partial mock-ups. (author). 9 figs.

44267 (IAEA-TECDOC–495, pp. 103-111) **Highlights of the technical status of nuclear robotics in Japan.** Shinohara, T. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan)); Tachikawa, K. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Research and development activities on advanced robotic remote system technologies for nuclear applications have been accelerated in Japan since 1980. In the development project of automated surveillance systems carried out from 1980 through 1984, two types of remotely operated mobile systems, mono-rail type and crawler type, were developed. In the field of reactor decommissioning technology development started in 1981, light-duty and heavy-duty amphibious robots for reactor dismantling work has been developed. The project of advanced robotics technology started in 1983 includes a program for nuclear application in which a four-legged walking robot is being developed. Basic research on intelligent robotic system technology for nuclear application is included in the new long term national program of nuclear energy development authorized recently by the Atomic Energy Commission. The R and D program of remote technology for fusion reactor maintenance has recently been studied and proposed. This program includes the development of robotic remote systems to be used in a highly radioactive vacuum vessel. (author). 8 refs, 6 figs.

44268 (IAEA-TECDOC–495, pp. 115-127) **Use of teleoperators and transporters in JET.** Raimondi, T. (Commission of the European Communities, Abingdon (UK). JET Joint Undertaking); Galbiati, L.; Jones, L.P.D.F. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number

DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The teleoperator for dexterous tasks is the Mascot IV force-feedback servomanipulator, consisting of a two-armed master unit and a kinematically similar slave. A load capacity of 20 kg, a sensitivity of 150 g, low inertia and good stiffness are among the main features. A microprocessor-based digital control system allows serial link and computer-aided teleoperation, teach-repeat, weight compensation and trajectory constraints. Typical tasks for the manipulator are leak detection, repair welding, bolting, insertion of connectors, positioning of mating parts, heating jackets and special tools, such as the lip cutting/welding trolleys and the orbital pipe welders and cutters. The manipulator can be positioned in the vessel by an articulated boom with five vertical hinges and a pan/tilt/roll end fixture. The boom enters the vessel through a port with small clearances situated on the equatorial plane and reaches round to the opposite side of the torus. To handle heavy components (antennae and limiters), the manipulator is replaced by special end-effectors. By controlling the accelerations to limit oscillations, it is possible to position a 350 kg payload at 10 m from the first hinge with 1 mm accuracy. The control modes, using a microprocessor-based system, are teach-repeat, joint-by-joint or resolved motion. Viewing is provided by two mono TV cameras mounted on articulated arms pre-programmed and in future, self-tracking to obtain direct and side views for depth perception. Outside the vessel, the main transporter will be a bridge-mounted telescopic boom at present being built by Noell to JET specifications, supplemented by the roving turret truck and low-level transporter. (author). 1 ref., 14 figs.

44269 (IAEA-TECDOC–495, pp. 129-140) **TFTR maintenance manipulator.** Selig, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik); Boehme, G.; Kungl, D.; Loesser, D.; Heitzenroeder, P.; Cerdan, G. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

TFTR plans to begin D-T experiments in early 1990. The D-T experimental program will produce a hundred shots, with a neutron generation rate of 10^{19} neutrons per shot. This will result in high levels of neutron activation in TFTR, especially in the vacuum torus. The primary purpose of the Maintenance Manipulator is to provide a means of remotely performing certain defined maintenance and inspection tasks inside the vacuum torus so as to minimize exposure of personnel to radiation. The Manipulator consists of a six-link folding boom connected to a fixed boom on a movable carriage. The entire Manipulator is housed in a vacuum antechamber connecting to the vacuum torus. Through a port formerly used for a vacuum pumping duct, the boom extends 180 degrees in either direction to provide complete coverage of the torus. The four 3500 liter/second turbopumps which were formerly used on the pumping duct will be mounted on the antechamber. The Manipulator will utilize two end effectors. The first, called a General Inspection Arm provides a moveable platform for an inspection camera and an in-vacuum leak detector. The second is a bilateral, force-reflecting pair of slave arms which utilize specially developed tools to perform several maintenance functions. All components except the slave arms are capable of operating TFTR's vacuum environment and during 150 deg. C bakeout of the torus. (author). 6 refs, 11 figs.

44270 (IAEA-TECDOC–495, pp. 151-161) **Vehicle concept for NET in-vessel inspection and maintenance.** Maisonnier, D. (CEA, 92 - Fonteney-aux-Roses (France). Unite de Genie Robotique Avance). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

When considering the problem of large tokamak machines in-vessel remote maintenance, an articulated boom concept is today a favourite choice mainly because of the large experience gathered in JET and TFTR. This concept suffers however from two major drawbacks because of its cantilever design and the large dimensions and masses of its articulated links: a rather "floppish" structure, which causes problems during heavy components pick-up; and an inaccurate trajectory control, which practically imposes very slow boom movements inside the toroidal vessel. Within the frame of the NET Technology Programs, CEA-UGRA has undertaken the development of an alternative concept. The aim was to propose a vehicle-based design which, because of the much smaller size of the end-effector carrier (the vehicle) onto a fixed rail (installed before each intervention), would overcome these difficulties. Although it is too early to assess the full potential of the proposed design, it is worth stressing that the two reasons which usually render a vehicle concept unacceptable - i.e. rails supports inside the vessel and cable management - have been extensively analysed and that the proposed solution appear satisfactory. Should this be confirmed by the forthcoming engineering design phase, the proposed vehicle will be a very attractive device for NET in-vessel interventions. (author). 11 refs, 10 figs.

44271 (IAEA-TECDOC–495, pp. 163-187) **Electric master-slave manipulators for remote maintenance in fusion plants.** Koehler, G.W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik); Huebener, J.; Salaske, M. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Maintenance work in fusion plants such as the Next European Torus (NET) call for mobile high performance general-purpose remote handling devices. This requirement can be fulfilled best by electric master-slave manipulators. The development of types conforming to the particular boundary conditions in fusion plants could be based on type EMSM 2-B conceived and built in the Federal Republic of Germany, and on the presently developed EMSM-WA for maintenance work in nuclear fuel reprocessing plants. The first type needed is for a NET in-vessel handling unit. It is envisaged for use as a double-arm manipulator unit and as a supplement to the necessary divertor plate handling unit. Since operations involving very diverse requirements in terms of loading and degrees of difficulty will have to be effected in the NET facility, an EMSM family has been conceived which consists of electric master-slave manipulators with four different handling capacities and several variants. (author). 11 refs, 22 figs, 1 tab.

44272 (IAEA-TECDOC–495, pp. 261-271) **Dynamic simulation for the study of remote handling operations.** Trudel, C.P.R. (Spar Aerospace Ltd., Toronto, ON (Canada)); Fung, P.T.K.; Rakhsha, F. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The inspection, maintenance and repair of fusion machines will require the extensive use of remote handling equipment to minimise the human exposure to the high radiation environment. A high fidelity simulation can be a very valuable tool to assist in the manipulator design, operations, trajectory planning, parameter optimisation and system verification. ASAD, a non-real time simulation program developed by Spar Aerospace, through funding from the National Research Council of Canada, is used to simulate the remote manipulator on the US Space Shuttle program. This simulation program is now being adapted to simulate a wide range of terrestrial manipulator configurations, most notably the In-Vessel Handling Unit (IVHU) for the Next European Torus (NET) program. This terrestrial version ASAD-T, is capable of simulating a manipulator consisting of up to 7 joints, and includes models of the flexible dynamics of the drive system and the structure, as well as the details of the control algorithms at the manipulator level and at the joint level. A modular

approach has been used such that a variety of manipulators and control systems can be simulated by module substitution. Extensive use of parametric data to describe the manipulator and control system permits the modelling of a wide variety of manipulator configurations. The simulation, as configured for the Space Shuttle Remote Manipulator System, has undergone an extensive validation process against other simulations, test data and actual flight data. This paper describes the capabilities and underlying assumptions of the simulation program ASAD-T, along with a brief description of the simulation development of an in-vessel manipulator for fusion reactors now in progress. (author). 4 refs, 8 figs.

44273 (IAEA-TECDOC–495, pp. 275-284) **Viewing systems for NET and TFTR.** Cerdan, G. (CEA, 92 - Fontenay-aux-Roses (France). Unite de Genie Robotique Avance); Maisonnier, D. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Very hostile environmental conditions are expected inside the NET (Next European Torus) and TFTR (Test Fusion Tokamak Reactor) vacuum vessels because of the machine structures activation by high energy neutrons. Remote viewing systems will therefore be required to perform a number of functions which will be essential for the identification, location and realization of most remote maintenance operations. This paper presents the CEA-UGRA recommendations for the NET viewing systems, NET Vessel Inspection System and NET Detailed Observation System, and a description of the viewing system which has been installed onto the TFTR Maintenance Manipulator. (author). 9 figs, 1 tab.

44274 (IAEA-TECDOC–495, pp. 285-301) **Electromagnetic and optical proximity sensors for in-vessel handling unit control.** Decreton, M. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Massaut, V.; Mortier, F. du. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The problems of collision protection and accurate positioning of the in-vessel handling unit of a fusion reactor are studied. It essentially concentrates on different sensing techniques capable to withstand the hostile environment foreseen for the maintenance work during the reactor shut down periods. After analysing the needs of hardware collision protection system, and situating the role of accurate proximity in the overall control system of the unit, a certain number of specific types of sensors are scanned. Their functionality, as well as their hardening to the environmental conditions are discussed. (author). 19 figs.

44275 (IAEA-TECDOC–495, pp. 201-213) **Integration, control and operation of JET remote handling equipment.** Rolfe, A.C. (Commission of the European Communities, Abingdon (UK). JET Joint Undertaking). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

This paper describes and discusses the interconnection, control and operation of the JET Remote Handling equipment comprising transporters, such as the articulated boom, end-effectors, such as the Mascot servo-manipulator, various welding, cutting and handling tools and the extensive CCTV viewing system. The focal point of the JET Remote Maintenance System (RMS) is the Remote Handling Control Room (RHCR) from which all RH equipment is monitored and controlled; this contains five general purpose RH Work Stations (RHWS), two real-time 3D Graphic Work Stations (GWS) and two Servo-Manipulator Master Stations (SMMS). The paper describes and discusses the design and use of the RHCR and its equipment highlighting those areas of particular importance for the Man-Machine Interface (MMI). The RMS comprises a 3-level hierarchical structure, consisting of the RH equipment Local Control Units (LCU), an interconnection system and a supervising minicomputer which provides an adaptable MMI. The RH equipment LCU's vary in type from simple discrete switching systems to multiprocessor intelligent controllers. The paper describes and discusses some of the more recent LCU's in use at JET. The interconnection system comprises a number of point-to-point serial links and two Local Area Networks (CAMAC and Ethernet). This architecture was adopted in order to fulfill the RH requirements whilst using as much JET standard CODAS equipment as possible to minimise development and maintenance costs. The control and operation of any piece of RH equipment is dictated by the LCU functions, the task and the MMI. (author). 8 refs, 9 figs.

44276 (IAEA-TECDOC–495, pp. 215-226) **Remote handling control with graphical man-machine interface for NET and JET.** Leinemann, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Kuehnapfel, U.; Ludwig, A. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

For fusion plants fully remote maintenance concepts are favoured for costs as well as for safety and availability reasons. The remote work in a geometrical complex environment with kinematical redundant manipulators calls for computer support. Hence a control system concept was worked out, which organizes a close, problem-suited cooperation of man and machine (computer), based on mutual surveillance and mutual help to get a maximum in safety of work and speed of operation. The system provides two modes of operation. In the automatic mode, the operator initiates and supervises autonomously working, pre-programmed subtasks (e.g. transportation with the boom). Interruptions and corrections by the operator are possible. In the manual mode of operation, the operator is working directly in the motion control loop, using different masters for various end-effectors. In this mode the operator has the full control, but he may be supported by so called handling support modules like for example coordinate transformations, resolved motion algorithms, collision control, or special positioning tools. The central module of the control system is a geometric/kinematic real-time simulator. This simulator serves for planning and off-line programming of maintenance sequences, and, in the execution phase, for synthetic scene presentation. In the latter case the simulator is controlled by the joint angle signals of the manipulator. It provides the operator with views not obtainable by TV-systems because of the restrictive possibilities of camera positioning, supplementing standard TV-systems which are indispensable for manually done contact work. A first implementation of a real-time simulator and its integration in an overall control system was done for JET. This system simulates the in-vessel handling with the JET-boom and its various end-effectors. An important problem in the area of simulation is the generation of model data.

44277 (IAEA-TECDOC–495, pp. 227-234) **Control system for the TFTR maintenance manipulator.** Mueller, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik); Hinz, A.; Menzel, U. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

A simple, low-cost and easy-to-operate control system is being developed by Kernforschungszentrum Karlsruhe (KfK) for the TFTR-Maintenance Manipulator (MM) for the Tokamak Fusion Test Reactor (TFTR) at the Princeton Plasma Physics Laboratory in

Princeton, N.J. (USA). High temperature stepper motors are used for the drives. Special incremental encoders attached to the second shaft end of the motors were designed for positioning purposes. The positioning principle is based on generating and counting electrical pulses. PTP and path control is provided. Deployment path determination was made utilizing CAD-generated drawings. Teach-in and playback possibilities are provided. (author). 1 ref., 6 figs.

44278 (IAEA-TECDOC–495, pp. 235-248) **Control system supporting different modes of telemanipulator operation for in-vessel handling.** Breitwieser, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Datenverarbeitung in der Technik). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

Fast maintenance capabilities of an IVHU system are of great importance in fusion plant operation. One key element is a set of work units. Some are specialized to certain handling tasks and some are of the kind of telemanipulators suited for more general purpose application. Different operation modes based on a microcomputer control system are described. Emphasis is put on the implementation of a control system by KfK-IDT using an EMSM-2 type servo master slave manipulator. Several classes of operation modes are distinguished ranging from complete manual to complete automatic modes. (author). 6 refs, 11 figs.

44279 (IAEA-TECDOC–495, pp. 325-337) **Application of SMAs to pipe connections, mechanical connections, vacuum seals and jack systems.** Kondoh, M. (Toshiba Corp., Tokyo (Japan). Fusion Technology Development Office); Uchida, T.; Iida, H. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The simplification of maintenance procedures for reactor structures is one of the important items for operating D-T fusion reactors. Remote maintenance applications using shape memory alloys (SMA) for fusion reactors is proposed and their feasibility discussed. Four types of SMA components have been fabricated and tested: pipe connector for primary coolant lines instead of welding/cutting, C-shaped mechanical quick connectors for segment connections instead of bolting, metal packing for vacuum seals instead of lip seal welding or metal O-rings, and jack systems for lifting heavy reactor components. For the pipe connectors, a flange-type was tested. A flange-type connector consists of two pipe flanges (SUS304, diameter 200) and twelve Ni-Ti SMA bolts (M6Xl50). A helium leak of less than $1x10^{-7}$ Pacenter dotl/s was not detected. For the C-shaped connectors, a pair of interlocking C-shaped plates is connected by eight Ni-Ti bolts (M8Xl84) and the SMA bolt recovery force is used as the connector force. A force of $4x10^{4}$N was obtained at 0.86% of the given strain. The metal packing is made by bonding SMA wire to an O-ring. A welding test of the SMA was done. Two SMA rods of 8 mm in dia. were bonded by CO_2 laser welding. The shape memory effect was not lost after welding. The jack systems consist of two oblique keys connected by SMA bolts (M9Xl260). A lifting force of $2.7x10^{4}$N was obtained at 1.9% of the given strain. From the results of these experiments, it was found that applications using SMAs, especially Ni-Ti alloys, is feasible for fusion reactors. (author). 7 refs, figs.

44280 (IAEA-TECDOC–495, pp. 303-310) **GMS - A high-precision geometry measurement system for large fusion reactor components.** Koehler, B. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

For the remote maintenance of fusion machines a surveying system will be needed for measuring the geometry of components outside (ex-vessel) as well as inside the vacuum-vessel (in-vessel). A study of principally applicable techniques indicated that the triangulation with theodolites is well suited for the ex-vessel surveying. The remote-controlled and CAD-supported surveying system GMS (Geometry Measurement System), developed by KfK, is equipped with two digital theodolites, a laser- and a camera-theodolite, completely controlled by a computer. The data transfer CAD-GMS will be realized with the standardized IGES-interface. To show the feasibility for the ex-vessel surveying a GMS-prototype, equipped with a single laser-theodolite, is built up presently. The investigations for the in-vessel surveying have been started and first design concepts for such equipment are outlined. (author). 9 refs, 5 figs.

44281 (IAEA-TECDOC–495, pp. 311-324) **Development of connection techniques for fusion devices.** Selig, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Ingenieurtechnik); Gumb, L. International Atomic Energy Agency, Vienna (Austria). Feb 1989. (CONF-8802131–: International meeting on robotics and remote maintenance concepts for fusion machines, 22-24 Feb 1988). In *Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988.* Order Number DE89634440/JAW. Available from NTIS (US Sales Only), PC A15/MF A01 - OSTI; INIS.

The Nuclear Research Center of Karlsruhe (KFK) has developed remote handling equipment for post irradiation examination hot cells, radwaste handling facilities and various other nuclear applications for a period of more than twenty-five years, but since a growing portion of the KFK R and D program has been devoted to fusion technology in recent years, KFK has established also a development program on remotely operated connection techniques for fusion devices. In order to get detailed information about the latest status a retroperspective literature research has been initiated at the beginning of the work. The result of this investigation was a variety of pipe connecting and pipe welding systems which were compared and evaluated. Another objective of the study was the comparison of welding and cutting techniques as an alternative solution for joining pipes and vacuum ducts. The results elaborated in the study show that there is no method or technique available which meets the requirement for fusion devices. Therefore an extensive R and D program has been proposed. The R and D program has been started with the investigation of pipe connectors for water cooling liquid metal breeder fuelling, gas cooling and gas purging systems, electrical connectors, and cutting and welding techniques for fusion reactors. Additional efforts have been going into the performance of tightness tests under normal and elevated stress conditions with selected pipe connectors, and in the investigation of a test rig for integral test of the connecting technique under NET typical geometrical conditions and with NET typical handling tools. The test facility will simulate the upper part of a prototype blanket segmentation including its auxiliary coolant make up and supply system. (author). 4 refs, 15 figs.

44282 (INIS-mf–11496) **Neutron energy spectrum in graphite blankets of fusion reactors. Measurements and calculations.** Tsechanski, A. Ben-Gurion Univ. of the Negev, Beersheba (Israel). Sep 1981. 122p. (In Hebrew). Order Number DE89634457/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

Neutron flux measurements were performed in a graphite stack and compared with calculations made with a two dimensional transport computer code. In the present work it is observed that the calculated spectrum in the elastic and inelastic scattering ranges (the first collision range in both cases), is sensitive to details of the angular distribution of these neutrons. Regarding the discrepancies in the elastic scattering range it is concluded that the microscopic cross section library ENDF/B-IV overestimates the large angle scattering (back scattering) as can be seen from comparison of measured and calculated spectra. The two most important conclusions of the present work are: 1. Inelastic scattering interaction of D-T neutrons in graphite cannot be calculated without a proper account of energy-angle correlation. 2. An experimental setup

supplying monoenergetic collimated D-T neutrons constitutes a sensitive although indirect means for measuring angular distributions in inelastic and elastic scattering. 49 refs.

44283 (INIS-mf–11500) **Interactions of D-T neutrons in graphite and lithium blankets of fusion reactors. Measurements and calculations.** Ofek, R. Ben-Gurion Univ. of the Negev, Beersheba (Israel). May 1986. 169p. (In Hebrew). Order Number DE89632031/JAW. Available from NTIS (US Sales Only), PC A08/MF A01 - OSTI; INIS.

The present study deals with integral experiment and calculation of neutron energy spectra in bulks of graphite which is used as a reflector in blankets of fusion reactors, and lithium, the material of the blanket on which lithium is bred due to neutron interactions. The collimated beam configuration enables - due to the almost monoenergeticity and unidirectionality of the neutrons impinging on the target - to identify fine details in the measured spectra, and also facilitates the absolute normalization of the spectra. The measured and calculated spectra are generally in a good agreement and in a very good agreement at mesh points close to the system axis. A few conclusions may be drawn: (a) the collimated beam source configuration is a sensitive tool for measuring neutron energy spectra with a high resolution, (b) the method of unfolding proton-recoil spectra measured with a NE-213 scintillator should be improved, (c) MCNP and DOT 4.2 may be used as complementary codes for neutron transport calculations of fusion blankets and deep-penetration problems, (d) the updating of the cross-section libraries and checking by integral experiments is highly important for the design of fusion blankets. The present study may be regarded as an important course in the research and development of tools for the design of fusion blankets. 126 refs.

44285 (INIS-SU–109/A, pp. 40-42) **On the efficiency of target acceleration in pulsed thermonuclear devices based on heavy ion beams.** Afanas'ev, Yu.V.; Isakov, V.A.; Kachiyan, K.A. AN SSSR, Moscow (USSR). Fizicheskij Inst. 1988. (In Russian). In *Experimental and theoretical physics.* Order Number DE89012198/JAW. Available from NTIS (US Sales Only), PC A04/MF A01; INIS.

Kratkie soobshcheniya po fizike.; no. 10.

The paper deals with derivation of the law of motion of tamper-absorber boundary in the case of heterogeneous energy release as well as with evaluation of the effect of proposal about immobility of this boundary on the choice of target structure. It is shown that at any degree of energy release heterogeneity the maximal hydrodynamic efficiency of multilayer target acceleration by heavy ion beams is achieved when tamper-absorber boundary is stable during the period of ion beam action. 3 refs.; 1 fig.

44286 (IPPCZ–280) **On optimization of the multijunction grill for the lower hybrid current drive.** Preinhaelter, J. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Apr 1988. 35p. Order Number DE89634490/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The design of a multijunction grill which is supposed to be used in current drive experiments, calls for the optimization over three most important parameters: the phase shift ΔPHI among the adjacent waveguides, the length of the multijunction grill L_g (from the junction to the mouth) and the surface density n_0. This was demonstrated by the results of a numerical investigation of the four-waveguide grill designed for a small tokamak. It was shown that current drive efficiency (or the directivity) can reach 50% for practically arbitrary ΔPHI (not =0deg, 180deg), if L_g is dosen adequately. Enhanced current drive efficiency at ΔPHInot =90deg follows from an unevenly distributed power among separate waveguides and from the self-adaptive adjustment of the phases of the incident waves. The risk of power overload of the waveguides grows with decreasing n_0. A brief description of the author's variant of the theory of wave diffraction on the junction is given in the Appendix. (author). 13 figs., 17 refs.

44287 (IPPCZ–283) **Effect of the length of the multijunction grill on its lower hybrid current drive efficiency.** Preinhaelter, J. Ceskoslovenska Akademie Ved, Prague (Czechoslovakia). Ustav Fyziky Plazmatu. Jun 1988. 43p. Order Number DE89634491/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

A slow wave structure known as a multijunction grill is often used in lower hybrid current drive and plasma heating experiments in tokamaks. The distance between the junction of subsidiary waveguides in the main line and the grill mouth is one of the most important grill parameters determining the spectrum of radiated waves, the total reflection coefficient, power distribution among waveguides and the actual phase shift of individual waves. For maximum lower hybrid current drive efficiency, the grill must also be optimized with respect to this parameter. The optimization procedure is shown by using the results of a numerical investigation of the four-waveguide multijunction grill operated in small tokamak CASTOR. (J.U.). 5 figs., 9 refs.

44288 (JAERI-M–89-038) **Observation of H-mode by edge heating solely by electron cyclotron heating in a divertor configuration of JFT-2M tokamak.** Hoshino, Katsumichi; Yamamoto, Takumi; Kawashima, Hisato and others. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1989. 10p. Order Number DE89906475/JAW. Available from NTIS (US Sales Only), PC A02/MF A01.

H-mode is observed by the edge heating of the JFT-2M plasma solely by the electron cyclotron heating (ECH). The threshold power for the H-mode transition is as low as 120 kW, which is the least threshold power observed in the JFT-2M tokamak. It is surprising that complete edge electron heating can produce the H-mode with such a small ECH power without the additional heating power at the plasma core. This result clearly shows that the H-mode mechanism lies at the very edge (near the separatrix) of the tokamak plasma in the divertor configuration. (author).

44289 (KFK–4567) **Thermodynamics of ceramic breeder materials for fusion reactors.** Goetzmann, O. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Kernfusion. May 1989. 41p. Order Number DE89796042/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

Based on known or deduced phase relationships in ternary lithium oxygen systems such as Li-Al-O, Li-Si-O and Li-Zr-O, the unknown free enthalpy of formation values of ternary compounds are calculated starting from the known data of the compounds of the binary border systems. Criterion for the data assessment is interconsistency of the data of all the compounds within a given multi-component system. With the help of these data the development of partial pressures during the breeding process can be calculated for all the compounds of interest. In order to facilitate a compatibility assessment the quaternary systems Cr-Li-Si-O, Fe-Li-Si-O and Be-Li-Si-O were also investigated and thermodynamic data of pertinent ternary and quaternary compounds determined. Both the partial pressure development and the compatibility behaviour of a lithium containing compound are criteria for its qualification as a breeder material for a fusion reactor. (orig.).

44290 (RAL–89-037) **Supra-ballistic phonons.** Russell, F.M. Rutherford Appleton Lab., Chilton (UK). May 1989. 9p. Order Number DE89634434/JAW. Available from NTIS (US Sales Only), PC A02/MF A01 - OSTI; INIS.

Energetic particles moving with a solid, either from nuclear reactions or externally injected, deposit energy by inelastic scattering processes which eventually appears as thermal energy. If the transfer of energy occurs in a crystalline solid then it is possible to couple some of the energy directly to the nuclei forming the lattice by generating phonons. In this paper the transfer of energy from a compound excited nucleus to the lattice is examined by introducing a virtual particle PI. It is shown that by including a PI in the nuclear reaction a substantial amount of energy can be coupled directly to the lattice. In the lattice this particle behaves as a spatially localized

phonon of high energy, the so-called supra-ballistic phonon. By multiple inelastic scattering the supra-ballistic phonon eventually thermalizes. Because both the virtual particle PI and the equivalent supra-ballistic phonon have no charge or spin and can only exist within a lattice it is difficult to detect other than by its decay into thermal phonons. The possibility of a PI removing excess energy from a compound nucleus formed by the cold fusion of deuterium is examined. (Author).

44291 (UCRL–52000-88-10, pp. 1-8) **Neutron penumbral imaging of laser-fusion targets.** Lerche, R.A.; Ress, D.B. Lawrence Livermore National Lab., CA (USA). Oct 1988. In *Energy and technology review.* Order Number DE89005308/JAW. Available from NTIS, PC A03/MF A01.

Using a new technique, penumbral coded-aperture imaging, the first neutron images of laser-driven, inertial-confinement fusion targets were obtained. With these images the deuterium-tritium burn region within a compressed target can be measured directly. 4 references, 11 figures.

44292 (UCRL–100013) **Modeling flashlamp-pumped ND:glass disk amplifiers.** Jancaitis, K.S.; Erlandson, A.C.; Murray, J.E.; Powell, H.T.; Trenholme, J.B. Lawrence Livermore National Lab., CA (USA). 2 Jun 1989. 18p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890423–13-Vugraphs: CLEO '89: conference on lasers and electro optics, Baltimore, MD (USA), 24-28 Apr 1989). Order Number DE89016635/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We have developed a semi-empirical model for Nd:glass disk amplifiers, parameterized in terms of the flashlamp output power, which substantially reduces the amount of experimental data required to fully characterize the amplifier performance. 3 refs.

44293 (UCRL–100358-Rev.1) **Commercial high current ignitron development: Revision 1.** Kihara, R.; Cummings, D.B.; Leighton, K.S.; Shulski, A.P. Lawrence Livermore National Lab., CA (USA). Jun 1989. 4p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-48. (CONF-890665–36-Rev.1: 7. Institute of Electrical and Electronics Engineers pulsed power conference, Monterey, CA (USA), 12-14 Jun 1989). Order Number DE89016650/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Our overall goal is to develop and qualify devices capable of repetitively switching high peak currents (>1 MA) and large quantities of charge (>500 C). In 1988 we designed and tested a hollow-anode ignitron at levels of up 925 kA and 280 C per shot. This level is three times that previously achieved with standard, commercially available tubes. Our latest designs, developed with the cooperation of industry, incorporate a hollow anode into an industrial ignitron. Prototypes have recently achieved levels of 770 kA and 270 C per shot. 4 refs., 6 figs., 1 tab.

Contents, abridged: Computer simulation of plasmas using particle codes. Propagation of obliquely incident light waves. Collisional absorption of electromagnetic waves in plasmas. Parametric excitation of electron and ion waves. Stimulated Raman scattering. Stimulated Brillouin scattering. Heating by plasma waves. Laser plasma experiments.

44295 Recent progress in inertial confinement fusion at Livermore. Bangerter, R.O. (Lawrence Livermore National Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 34-37 (15 May 1989). (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

Progress since the last Heavy-Ion Fusion Symposium has moved us much closer to demonstrating the scientific and technological requirements for inertial confinement fusion. By operating the Nova laser at the third harmonic of 1.06 μm light, we have virtually eliminated earlier concerns about hot electrons. A wide variety of diagnostics provide high-quality data. For example, the burning fuel is now imaged by 150 ps X-ray framing cameras and a new penumbral neutron imaging technique. The experimental data from Nova agree well with computer simulations. (Lawrence Berkeley Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 13-18 (15 May 1989). DOE Contract AC03-76SF00098. (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

Since October 1983 most of the research in the USA on heavy-ion fusion (HIF) has been devoted to the physics and technology of the induction linac driver. The economic viability of the method was confirmed in the recent HIF systems assessment study. Research at Berkeley comprises three experimental activities: (a) the multiple-beam experiment, MBE-4, which accelerates four parallel, separately focused beams of cesium ions from 0.2 to 1 MeV, and in which amplification of the beam power by a factor of nearly 40 is observed; (b) development of a 16-beam pulsed 2 MV injector; and (c) a single beam transport experiment (SBTE) for studying collective phenomena in ion beam transport. In addition, a major activity has been the development of a physics and engineering design for a larger experiment to test (in a scaled way) almost all of the manipulations needed in a full-scale driver. A complicating feature in the design is the combining of beams (in sets of four to one); the penalty in collectively enhanced emittance growth must be balanced against the cost savings gained in a driver. 44297 Photoionization of beam ions. Langdon, A.B. (Lawrence Livermore National Lab., CA (USA)); Bangerter, R.O.; Liberman, D.A. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 68-71 (15 May 1989). DOE Contract W-7405-ENG-48. (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

In addition to the role of photoionization in the context of ionizing the gas in the target chamber, the possible importance of photoionization of the ion beam itself by thermal radiation emitted by the target as it heats was pointed out by W. Herrmannsfeldt. Rough estimates show this could be of interest due to its effect on the focusing of the beam. We used X-ray output spectra from the LASNEX modeling of targets driven by 1-5 MJ, and photoionization cross sections for Pb^{n+} to calculate the position and time-dependent photoionization of a beam of Pb^{3+} ions. Then we made estimates of this effect on beam dynamics. We found that half the ions at the end of the pulse have been photoionized by the time they reach $\simeq$ 20 cm from the target. In a simple model of the electrostatic forces, half the beam is deposited outside the intended spot. (orig.).

44298 Generation of stable mixed-compact-toroid rings by inducing plasma currents in strong E rings. Jayakumar, R. (GE Medical Systems, General Electric Co., Florence, SC (US)); Taggart, D.P.; Parker, M.R.; Fleischmann, H.H. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(1): 41-44 (Feb 1989).

In the RECE-Christa device, hybrid-type compact toroid rings are generated by inducing large toroidal plasma currents I_{tho} in strong electron rings using a thin induction coil positioned along the ring axis. Starting from field-reversal values δ_o = 50 - 120 percent of the original pure fast-electron ring, the induced plasma current I_{tho} raises δ to a maximum value of up to 240 percent with I_{tho} contributing more than 50 percent of the total ring current. Quite interestingly, the generated hybrid compact toroid configurations appear gross-stable during the full I_{tho} pulse length (half-amplitude width about 100 μs).

44299 Three-dimensional magnetohydrodynamic simulations of field error effects in ZT-H and ZT-40 reversed-field pinch devices. Sidikman, K.L. (9512470); Nebel, R.A.; Callen, J.D. *Fusion Technology (USA),* 15(1): 29-36 (Jan 1989).

Magnetic perturbations caused by field errors may pose a threat to magnetic confinement. They can cause the formation of magnetic islands, which may increase transport. The response of a reversed-field pinch (RFP) plasma to field errors has been calculated

numerically. A three-dimensional nonlinear magneto-hydrodynamic code was used, with field errors specified as boundary conditions. Two types of field errors were studied: those arising from current flowing in the toroidal field coil set and those arising from induced currents in the conducting shell flowing around holes. Design data from two RFPs at the Los Alamos National Laboratory - ZT-40 (currently operating) and ZT-H (being designed) - were used. Results on the effect of the plasma on the radial field perturbation and on island size are given. The effects of the chosen equilibrium current profile resistivity, and viscosity are discussed.

44300 Formation and steady-state sustainment of a tokamak by coaxial helicity injection. Jarboe, T.R. (9512470). *Fusion Technology (USA),* 15(1): 7-11 (Jan 1989).

A possible method for steady-state sustainment of a tokamak through coaxial helicity injection is presented. To keep the toroidal flux constant, two insulators are used, one that injects and one that absorbs toroidal flux. The scheme is made attractive by incorporating the toroidal field of the tokamak in the source to raise its impedance.

44301 Time-dependent simulations of a Compact Ignition Tokamak. Stotler, D.P. (5313000); Bateman, G. *Fusion Technology (USA),* 15(1): 12-28 (Jan 1989).

Detailed simulations of the Compact Ignition Tokamak are carried out using a 1 1/2-dimensional transport code. The calculations include time-varying densities, fields, and plasma shape. Ignition can be achieved in this device if somewhat better than L-mode energy confinement time scaling is possible. The performance of such a compact, short-pulse device can depend greatly on how the plasma is evolved to its flattop parameters. Furthermore, in cases such as the ones discussed here, where there is not a great deal of ignition margin and the electron density is held constant, ignition ends if the helium ash is not removed. In general, control of the deuterium-tritium density is equivalent to burn control.

44302 Beam funneling studies at Los Alamos. Stovall, J.E. (Los Alamos National Lab., NM (USA)); Guy, F.W.; Stokes, R.H.; Wangler, T.P. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 143-147 (15 May 1989). (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

Funneling two ion beams by interlacing their bunches can reduce the cost and complexity of systems producing intense beams. Applications of funneling could include accelerators for heavy-ion inertial fusion, electronuclear breeding and fusion materials irradiation. Funneling in an RFQ-like structure is an elegant solution at low energy where electric fields are needed to provide strong focusing. Discrete-element funnels, with separate focusing elements, bending magnets, rebunchers and rf deflectors, are more flexible. At sufficiently high energies magnetic-quadrupole lenses can provide strong focusing in a discrete-element funnel. Such a funnel has been designed as a preliminary example of a second funnel in the HIBALL-II accelerator system. In a simulation, two Bi^{1+} (mass = 209 amu) beams at 0.5 MeV/A, 20 MHz and 40 mA, separated by 55 cm and angled at $\pm 6^0$ were combined into a single 80 mA beam at 40 MHz. Emittance growth was calculated, by a modified version of the PIC (particle-in-cell) code PARMILA, to be about 1%. Funnel design experience at Los Alamos has evolved rules of thumb that reduce emittance growth. Some of these are to maintain focusing periodicity and strength in both transverse and longitudinal directions; use strong focusing so that the bunch will be small; minimize angles of bend and rf deflection; adjust longitudinal focusing to produce a short bunch at the rf deflector; and design rf deflectors for a uniform electrical field. (orig.).

44303 Accelerator research on MBE-4, an experimental multibeam induction linac. Meuth, H. (Lawrence Berkeley Lab., CA (USA)); Fessenden, T.J.; Keefe, D.; Warwick, A.I. *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 153-162 (15 May 1989). (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

The multiple-beam accelerator MBE-4 is a device for research toward a heavy-ion driver for inertial confinement fusion, based on the induction linac concept. Its main goal is proof of the principle of current amplification by acceleration and controlled self-similar beam pulse compression. Into the 16 m long device four beams, each with an initial current of 10 mA, are injected from a Marx-driven diode at 200 keV. The current amplification is up to ninefold, with a final beam energy of about 800 keV in the middle of the bunch. Now that all the apparatus' accelerator sections have been completed, installed and aligned, and its unaccelerated transport properties have been studied, our experimental research has reached the crucial phase of implementing appropriate accelerator schedules that approximate self-similar current-pulse compression. These schedules are established through a close interplay of computations using a one-dimensional simulation code and a manual empirical tuning procedure. In a first approach, with a rather vigorous schedule that uses most of the accelerator modules to their voltage limits, we have determined the limits of our capability for controlled pulse compression, mainly due to waveform shaping of the driving pulse-forming networks. We shall report on these results. In the future we will also aim for gentler schedules that would model an inertial confinement fusion scenario more closely. (orig.).

44304 Achromatic beam combiner and bend system for ILSE. Lee, E.P. (Lawrence Berkeley Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands),* 278(1): 178-181 (15 May 1989). DOE Contract AC03-76SF00098. (CONF-8806101–: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

The lattice configuration of the beam combiner and bend system of the proposed induction linac system experiment (ILSE) is described. These subsystems must transport high-current ion beams having large momentum variations with a single pulse ($\Delta P/P_0 \leq \pm 0.1$) with minimal beam loss or emittance growth. Configurations which are achromatic through first order, including the effect of image fields, have been developed. Calculations of the beam envelope and centroid motion are made with the beam dynamics code HICURB, which includes strong space-charge effects and chromatic effects through all orders. (orig.).

44305 Thermal shock testing of candidate compact ignition Tokamak graphites. Croessmann, C.D. (9511392); Gilbertson, N.B.; Watson, R.D.; Whitley, J.B. *Fusion Technology (USA),* 15(1): 127-135 (Jan 1989).

Sandia National Laboratories, Division of Fusion Technology, has performed a series of tests in support of the Compact Ignition Tokamak first-wall tile design. A screening study was done to rank the thermal shock resistance of 25 candidate graphite materials. Standardized thermal shock samples were subjected to identical intense heat pulses generated by the electron beam test system. Most of the fine-grained graphites cracked, but none of the carbon-carbon (C-C) composite samples fractured. The best performing fine-grained graphites were, in order, Union Carbide's TS-1909, TS-1792, ATJ-S, and CGW, as well as Fiber Material Inc.'s (FMI's) high-density graphite (HDG).

44306 Erosion and redeposition of graphite by hydrogen plasmas. Goebel, D.M. (9523812); Conn, R.W.; Hirooka, Y.; Leung, W.K.; Nygren, R.E.; Tynan, G.R.; Bohdansky, J. *Fusion Technology (USA),* 15(1): 102-107 (Jan 1989).

The results of erosion and redeposition studies of graphite by hydrogen plasma bombardment in the PISCES facility are reviewed. The total erosion yields of several types of graphites have been measured during plasma exposure with ion fluxes of up to 2×10^{18} $cm^{-2} \cdot S^{-1}$, ion energies of 50 to 200 eV, and sample temperatures of 50 to 950^0C. Hydrogen and deuterium plasmas have been used to bombard Poco, ATJ, and pyrolytic graphites, and a four-directional carbon-carbon (C-C) composite weave. The erosion rates of all the graphites tested are about equal, suggesting that surface damage by the ion bombardment results in similar erosion yields. The C-C composite weave material showed an increased weight loss during initial exposure, and then equal or lower erosion yields compared to the other graphites.

44307 Hydrocarbon transport in a plasma boundary layer. Langer, W.D. (5313000); Ehrhardt, A.B. *Fusion Technology (USA)*, 15(1): 118-126 (Jan 1989).

The theory of carbon transport in a plasma boundary layers is important for understanding the impurity penetration, and carbon and hydrogen recycling, in tokamaks using carbon compounds as limiters and as wall coatings. Neutral carbon kinetics and transport at the edge of plasma devices where chemical release is a source of carbon are modeled. Plasma reactions with carbon and hydrocarbons are important for such modeling, and these collisional processes are summarized. Combining the reaction schemes and kinetics in the DEGAS code makes it possible to treat the neutral transport at the plasma boundary layer. Results of such modeling of the atomic carbon and methane distribution at the edge are presented for comparison with recent carbon probe experiments performed on the Divertor and Injection Tokamak Experiment (DITE).

44308 Induction linac drivers: Prospects for the future. Keefe, D. (Lawrence Berkeley Lab., CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands)*, 278(1): 266-270 (15 May 1989). (CONF-8806101--: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

This review is intended to place in perspective our current view of the parameter ranges for induction linac drivers that lead to attractive scenarios for civilian electrical power plants; there is a surprising degree of choice (a factor of 2 or so in most parameters) before any significant impact on the cost of energy results. The progress and goals of the US heavy-ion fusion accelerator research (HIFAR) program are reviewed. The step between the realization of the HIFAR goals and a full-scale driver is seen to be very large indeed and will require one or more significant intermediate steps which can be justified only by a commitment to advance the HIF method towards a true fusion goal. Historial anomalies in the way that fusion programs for both military and civilian applications are administered will need to be resolved; the absence of any presently perceived energy crisis results in little current sense of urgency to develop vigorous long-term energy solutions. (orig.).

44309 Scenarios for fusion energy. Herrmannsfeldt, W.B. (Stanford Linear Accelerator Center, CA (USA)). *Nuclear Instruments and Methods in Physics Research, Section A: Accelerators, Spectrometers, Detectors, and Associated Equipment (Netherlands)*, 278(1): 276-280 (15 May 1989). DOE Contract AC03-76SF00515. (CONF-8806101--: International symposium on heavy ion inertial fusion, Darmstadt (Germany, F.R.), 28-30 Jun 1988).

Are there scenarios for the near future (5-10 years) in which the public interest in, and political support for, fusion energy are likely to increase significantly? If such a scenario should occur, what should the status of heavy-ion fusion be at that time so that it is looked upon as a favored approach? If such a status can be identified, what should the research strategy be so that this status can be achieved in a timely way? This paper will look for answers to the first two of the above questions. If the goal of a desired status can be identified, the research strategy may become obvious. Of the four long-term energy options - coal, solar, fission breeders and fusion - the present position of fusion is in fourth place, never having generated any power. However, coal has environmental and safety problems. Solar has limitations of cost, availability and space requirements. Fission in general, and breeder reactors in particular, have problems of cost, environment and public acceptance. To be accepted and elevated to a position of equality with the others, heavy-ion fusion must simultaneously avoid their real and perceived major flaws. To succeed, heavy-ion fusion must strive to be markedly the best fusion option. (orig.).

44310 An improved method of calculating flux coordinates. Rome, J. A. (Oak Ridge National Laboratory, P.O. Box 2009, Oak Ridge, Tennessee 37831 (US)). *Journal of Computational Physics (USA)*, 82(2): 348-361 (Jun 1989). DOE Contract AC05-84OR21400.

The twisty nature of stellarator geometry can be "hidden" from many calculations by basing a coordinate system on the twisty flux surfaces. A particularly good choice for this flux coordinate system, developed by A. H. Boozer, has straight field lines and a Jacobian that depends only on the magnitude of the magnetic field B. Boozer's original method of generating the coordinate system had difficulty in determining the correct harmonics when the rotational transform, t (the number of times a field line twists around the torus in the short direction for each transit in the long direction), is rational ($t=n/m$) and when the transform per field period is large. With this improved method, two field lines are used to calculate Boozer's flux coordinates on a given flux surface. This splits the spectra so that adjacent toroidal mode numbers are assigned to different spectra, and the correct amplitudes of overlapping harmonics can be determined. © 1989 Academic Press, Inc.

44311 Algorithm for the calculation of three-dimensional ICRF fields in tokamak geometry. Smithe, D.N.; Colestock, P.L.; Kashuba, R.J.; Kammash, T. *Transactions of the American Nuclear Society (USA)*, 57: 303 (1988). (CONF-881011--: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

One of the most promising schemes for heating plasmas to thermonuclear temperatures in magnetic fusion devices is radio-frequency heating, particularly at the ion cyclotron resonance frequency. Most studies of this problem assume the magnetic field that confines the plasma to be constant or at best one-dimensional, whereas in reality it is quite complex. In this paper the authors introduce a computational scheme that permits tractable calculation of three-dimensional full-wave solutions to the Vlasov-Maxwell equations under typical experimental conditions associated with the ion cyclotron range of frequencies. The method is unique in that power deposition to the plasma is determined via the anti-Hermitran part of a truncated warm plasma dielectric operator, rather than as the result of an assumed phenomenological frequency. The resulting computer code allows arbitrary variation of density, temperature, magnetic field, and minority concentrations in the poloidal plane by performing a convolution of poloidal in the radial variable. By assuming no inhomogeneity along the toroidal axis, an inverse transform over the parallel wave number is performed, yielding the global three-dimensional fast-wave solutions. The results are applied to such plasmas as exist in the Tokamak Fusion Test Reactor and find that a mild resonance structure in antenna loading exists that is related to the changing number of wavelengths between the antenna and the resonance layer.

44312 $^{244}CmO_2$/nat.-UO_2 hybrid blanket with flat fission power production. Sahin, S. (Gazi Univ. (Turkey)); Erisen, A.; Cebi, Y. *Transactions of the American Nuclear Society (USA)*, 57: 303-305 (1988). (CONF-881011--: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

In the present study, $^{244}CmO_2$ is mixed with nat.-UO_2 for the purpose of power flattening in a hybrid blanket with a reasonably high energy multiplication factor. Also, the temporal variations of the fission power density (FPD) are observed during an 18-month plant operation period. The main conclusion drawn from this work is that it became possible to keep a flat fission power profile (FPP) over a very long plant operation period of 18 months by simply omitting the beryllium multiplier in the blanket and keeping the neutron spectrum fairly unchanged throughout the fission zone. This reduced the efforts for fuel management to a minimum. A further observation focused on only minor variations of the integral neutronic data over longer plant operation periods. Among others, the fission power generation increase is also very modest. This results in an optimum investment for the nonnuclear island. The blanket burns up high-level nuclear waste ^{244}Cm effectively, with efficient electricity production and breeding of a new type of nuclear fuel ^{245}Cm with very superior nuclear properties. Finally, a warning should be issued for the careful international safeguarding of such a hybrid plant due to the extremely high quality of the bred plutonium fuel.

44313 Prospects for D-^{3}He fuels in field-reversed configurations. Kernbichler, W. (Univ. of Illinois, Urbana (USA)); Miley, G.H.; Heindler, M. *Transactions of the American Nuclear Society (USA)*, 57: 305-306 (1988). (CONF-881011--: Joint meeting of the European Nuclear Society and the American Nuclear Society, Washington, DC (USA), 30 Oct - 4 nov 1988).

The discovery of lunar ^{3}He has increased interest in the development of D-^{3}He fusion. One of the most attractive confinement

concepts for burning D-^{3}He is the field-reversed configuration (FRC). The good confinement due to the closed field lines combined with the high β and the divertor action of the open field lines are especially attractive to reduce radiation losses and to use direct conversion techniques for the diverted plasma flow. There is also some evidence that charged fusion products can produce a seed current, which, when combined with pellet refueling, could maintain the FRC, allowing steady-state operation. This is important for D-^{3}He operation, since the startup energy investment for this cycle is relatively large. One approach to startup involves the initial creation of a deuterium-tritium (D-T) plasma at $\approx$ 6 to 10 keV, triggering a thermal runaway toward an operating point of 50 to 100 keV for D-^{3}He and changing the fuel content from D-T to D-^{3}He. In the work discussed in this paper, the authors examine the feasibility and characteristics of a D-^{3}He-fueled FRC. Various figures of merit are calculated, including operational windows, ignition domains, nt and Tnt requirements, power densities, neutron production, and tritium load.

44314 Numerical studies of deuterium-tritium ignition in impact-fusion targets. Zubrin, R.M. (6807000); Ribe, F.L. *IEEE (Institute of Electrical and Electronics Engineers) Transactions on Plasma Science (USA),* 17(3): 459-462 (Jun 1989).

A numerical one-dimensional solution of the Euler equations for an imploding spherical tungsten shell with internal deuterium-tritium gas is applied to study impact-fusion dynamics with parameters of fusion reactor relevance. Thermal conduction and radiative energy loss by the plasma are taken into account, as is heating by fusion generated alpha particles. A variety of target sizes and impact velocities are examined, and scaling laws for fusion yields are deduced which define possible parameters for conceptual commercial impact-fusion power reactors. It is found that shell energies and velocities of about 30 MJ and 110 km/s would be satisfactory. A commercial impact-fusion reactor based on such parameters is discussed.

44315 Tritium module for ITER/TIBER system code. Finn, P.A. (0448000); Busigin, A.; Kalyanam, K.M. *Fusion Technology (USA),* 14(2): 677-682 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

A tritium module was developed for the ITER/TIBER system code to provide information on capital costs, tritium inventory, power requirements, and building volumes for these systems. In the tritium module, the main tritium subsystems - plasma processing, atmospheric cleanup, water cleanup, blanket processing - are each represented.

44316 Solubility of tritium in $Pd_{1-Y}Ag_Y$ alloys (Y = 0.00, 0.10, 0.20, 0.30). Lasser, R. (3563000); Powell, G.L. *Fusion Technology (USA),* 14(2): 695-700 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

Solubility measurements of tritium (T) in $Pd_{1-Y}Ag_Y$ alloys (Y = 0.00, 0.10, 0.20, 0.30) are reported in the temperature range of 250 K to 733 K, the pressure range below 3 bar, and the concentration range of 0.001 to 0.64 hydrogen to metal atom ratio. To study isotopic effects, the pressure-concentration-temperature relationships of the hydrogen isotopes protium (H) and deuterium (D) have been measured using the same samples and experimental setup and to temperatures as high as 1500 K using a different set up and samples. The experimental data are compared with values for H and D determined by other groups. In the case of T, most of the data presented have not been determined before. From these data the Sieverts' constants were calculated which show a strong temperature and isotope dependence. Analytical expressions, based on models that assume various degrees to which the hydrogen can perceive the alloy composition of individual sites in an alloy, are given for the Sieverts' constants that allow the calculation of the standard Gibbs free energies, enthalpies and entropies of H, D and T in these alloys.

44317 The blanket interface to TSTA. Clemmer, R.G. (9502030); Finn, P.A.; Grimm, T.L.; Sze, D.K.; Anderson, J.L.; Bartlit, J.R.; Naruse, Y.; Yoshida, H. *Fusion Technology (USA),* 14(2): 657-662 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

The requirements of tritium technology are centered in three main areas, (1) fuel processing, (2) breeder tritium extraction, and (3) tritium containment. The Tritium Systems Test Assembly (TSTA) now in operation at Los Alamos National Laboratory (LANL) is dedicated to developing and demonstrating the tritium technology for fuel processing and containment. TSTA is the only fusion fuel processing facility that can operate in a continuous closed-loop mode. The tritium throughput of TSTA is 1000 g/d. However, TSTA does not have a blanket interface system. The authors have initiated a study to define a Breeder Blanket Interface (BBIO) for TSTA. The first step of the work is to define the condition of the gaseous tritium stream from the blanket tritium recovery system. This report summarizes this part of the work for one particular blanket concept, i.e., a self-cooled lithium blanket. The total gas throughput, the hydrogen to tritium ratio, the corrosive chemicals, and the radionuclides are defined. Various methods of tritium recovery from liquid lithium were assessed: yttrium gettering, permeation windows, and molten salt extraction. The authors' evaluation concluded that the best method was molten salt extraction.

44318 Measurement of the solubility of tritium in copper and gold at high pressures. Swansiger, W.A. (5659000). *Fusion Technology (USA),* 14(2): 631-636 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

An apparatus and technique were developed to measure the solubility of tritium in high diffusivity metals at tritium pressures up to 136 MPa (20,000 psia) and temperatures up to 700 K. The experiments described in this paper took advantage of the low detection limits for tritium and helium-3 to determine the solubilities of high pressure tritium in copper and gold at temperatures as low as 473 K, where solubilities are below the limits of detection for hydrogen or deuterium. Samples were exposed to high pressure tritium at an elevated temperature long enough to reach equilibrium, then cooled within seconds by dropping them into a cold (77 K) section of the apparatus, thereby immobilizing the dissolved tritium. Solubilities were then determined by acid dissolution/liquid scintillation counting or, alternatively, by vacuum fusion/helium-3 analysis. For both copper and gold, surface effects were found to be extremely important because (1) they greatly increased the time required for the samples to equilibrate with the tritium overpressure and (2) there was more tritium on and near the surface than was contained in the bulk of a sample. In the absence of trapping, the solubilities determined at high pressures at temperatures between 473 K and 673 K agreed well with extrapolations of solubilities measured at 0.1 MPa hydrogen and temperatures >873 K.

44319 HE^3 outgassing from four working palladium and uranium beds. Coronado, P.R. (9513035); Fearon, E.M.; Garza, R.G.; Shaw, J.F.; Souers, P.C.; Stump, R.K.; Tsugawa, R.T. *Fusion Technology (USA),* 14(2): 741-743 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

The He^3 output from two palladium and two uranium beds that store T_2 and D-T was studied as a function of time. Three of the beds were started new and watched for 1 yr; the fourth bed was 12 yr old. All four beds were used in routine tritium handling. Initial stoichiometries were $PdT_{0.3}$ and $UT_{0.7}$ so that both operated at similar pressures from 1 to 130 kPa. The He^3 from palladium ranged from the 0.002 mol% lower level of sensitivity to 0.01% for Pd/T_2 at 1 yr of age. The U/T system showed 0.1% He^3 at 4 to 62 days and 0.1 to 10% at longer times, with the first cuts being high in He^3. The palladium bed with 95 to 97% pure T_2 enriches the output to as high as 97 to 99%.

44320 Increase of tritium permeation through resistant metals at 323 K by lattice defects. Maienschein, J.L. (9513035); McMurphy, F.E.; Duval, V.L. *Fusion Technology (USA),* 14(2): 701-706 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

The authors report data on tritium permeation at 323 K and 373 K through annealed and single crystal copper for comparison with earlier data on unannealed copper, and show that tritium transport

along grain boundaries or other lattice defects controls the overall rate at 323 K in unannealed material. Measurements on unannealed and annealed gold foil also indicate the importance of defect transport, although with gold the authors could not reduce the defect concentration sufficiently to measure permeation through the metal lattice. They also include permeation data on aluminum, molybdenum, tungsten, beryllium, cadmium, tritium, lead, rhenium, and silver; all of these were probably dominated by tritium transport along lattice defects.

44321 Lithium test module on ITER/TIBER. Finn, P.A. (0448000). *Fusion Technology (USA),* 14(2): 798-803 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

ITER/TIBER (ITER) is the U.S. version of the design for the International Thermonuclear Experimental Reactor. The role of ITER is to test nuclear components for fusion power reactors. A major nuclear component to be tested is the breeder blanket and its associated tritium recovery system. To assist in the design of ITER, the engineering design of different blanket systems was done. This report summarizes a design of the tritium recovery system for a liquid lithium blanket, a prime candidate for a fusion power reactor. Objectives of this design were to ensure that a reliable, integrated performance of the tritium recovery system could be demonstrated and that the tritium could be measured. The latter objective permits one to validate the performance of the blanket module. For the tritium recovery system, the contractors and the electrolysis units were sized and costed. The magnetic force on the contactor was assessed. The tritium inventory for the system and the blanket module was calculated. Tritium recovery systems for larger blanket units could be designed using the information developed in this report.

44322 Parameters important in the oxidation of tritium at a stainless steel surface. Finn, P.A. (0448000); VanDeventer, E.H. *Fusion Technology (USA),* 14(2): 783-790 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

The heterogeneous reaction between oxygen/helium gas, tritium and stainless steel was studied at the back surface of a stainless steel tube. The yield of tritiated water was determined as a function of oxygen concentration, tritium concentration, protium concentration, flow rate, and temperature. This report describes the results for two sets of runs done at 550°C with and without 15 ppm protium in the oxygen/helium gas. At oxygen concentrations of 40 ppm, the presence of excess protium in the oxygen/helium produced a reduced yield of tritiated water. At oxygen concentrations >1000 ppm, the two yields were equivalent, 98%.

44323 Effect of the self-pumped limiter concept on the tritium fuel cycle. Finn, P.A. (0448000); Sze, D.K.; Hassanein, A. *Fusion Technology (USA),* 14(2): 791-797 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

The self-pumped limiter concept was the impurity control system for the reactor in the Tokamak Power Systems Study (TPSS). The use of a self-pumped limiter had a major impact on the design of the tritium systems of the TPSS fusion reactor. The self-pumped limiter functions by depositing the helium ash under a layer of metal (vanadium). The majority of the hydrogen species are recycled at the plasma edge; a small fraction permeates to the blanket/coolant which was lithium in TPSS. Use of the self-pumped limiter results in the elimination of the plasma processing system. Thus, the blanket tritium processing system becomes the major tritium system. The main advantages achieved for the tritium systems with a self-pumped limiter are a reduction in the capital cost of tritium processing equipment as well as a reduction in building space, a reduced tritium inventory for processing and for reserve storage, an increase in the inherent safety of the fusion plant and an improvement in economics for a fusion world economy.

44324 Tritium storage in ion-exchanged zeolites. Maienschein, J.L. (9513035); McMurphy, F.E.; Uribe, F.S. *Fusion Technology (USA),* 14(2): 775-782 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

Cesium-exchanged Type 4A zeolites can encapsulate high-pressure tritium by physical entrapment in interior pores. The authors present data on storage capacity related to physical pore volume in the zeolite, and show that storage stability is reasonably good for short periods. Their data also shows that the zeolite releases helium while retaining tritium. Results are analyzed in terms of a diffusion model in the literature. The zeolite showed no structural change after a radiation dose of 10^8 Gy; it is unclear if radiation affects storage stability.

44325 Pyrophoricity of tritium-storage bed materials. Longhurst, G.R. (9502158). *Fusion Technology (USA),* 14(2): 750-755 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

Experiments were conducted on samples of depleted uranium and on intermetallic compounds of zirconium-cobalt and lanthanum-nickel-aluminide to evaluate the pyrophoricity of the activated materials and their hydrides and deuterides on exposure to air. None of the materials spontaneously ignited when exposed to room temperature air, but the uranium and the zirconium-cobalt both ignited in air at moderately elevated temperatures. Activated dehyrdided materials ignited at essentially the same temperatures. Deuterides showed effectively the same characteristics as the hydrides except the ignition temperature of zirconium-cobalt deuteride was reduced by 20 - 50 K from that of the hydride. The pyrophoricity of these materials raises concern about the possibility of fires in tritium-storage beds with attendant damage to the bed and dispersal of tritiated debris, but fires may not occur until the bed is heated.

44326 Some new techniques in tritium gas handling as applied to metal hydride synthesis. Nasise, J.E. (9512470). *Fusion Technology (USA),* 14(2): 744-749 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

A state-of-the-art tritium Hydride Synthesis System (HSS) was designed and built to replace the existing system within the Tritium Salt Facility (TSF) at the Los Alamos National Laboratory. This new hydriding system utilized unique fast-cycling 5.63 mole uranium beds (50.9 g to T_2 at 100% loading) and novel gas circulating hydriding furnaces. Tritium system components discussed include fast-cycling uranium beds, circulating gas hydriding furnaces, valves, storage volumes, manifolds, gas transfer pumps, and graphic display and control consoles. Many of the tritium handling and processing techniques incorporated into this system are directly applicable to today's fusion fuel loops.

44327 Implantation-driven tritium permeation in vanadium alloy fusion reactors. Holland, D.F. (9502158); Anderl, R.A. *Fusion Technology (USA),* 14(2): 707-712 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

The safety concerns resulting from tritium implantation into vanadium and vanadium alloys have been studied. Tests were conducted to measure the physical constants that determine permeation and inventory in these materials. Surface recombination coefficients, enhancement factors due to plasma sputtering, and the diffusion constants were measured. To determine the implications of these results, application was made to the TITAN-I fusion reactor design. For this design, the tritium permeation rate and inventory buildup in the first wall was calculated for a range of surface conditions on the coolant side.

44328 Effect of impurities on ions in tritium. McConville, G.T. (9515000). *Fusion Technology (USA),* 14(2): 869-875 (Sep 1988). (CONF-880505--: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

Tritium has a steady state ion concentration of about one part in 10^9 of the background molecules. It will be shown that the recombination with electrons limits the ion density and the recombination is faster if the ions is in an excited vibrational state . These ions determine the reaction rates with other gases. When impurities of the order of 1 ppm are present, the ion resides on the impurity. Impurities are shown to affect the temperature dependence of the $D_2 + T_2$ reaction. The decrease in reaction rate with increasing temperature above 200 K is consistent with the increasing vapor pressure of an

impurity, but the level must be below 10 ppm. Unfortunately such an impurity may be below the level of our present detectability. How this situation may come about in the DT reaction is discussed in this paper.

44329 Ammonia in tritium systems. Gill, J.T. (9515000); Ellefson, R.E.; Paulick, R.P.; Colvin, C.M.; Yauger, R.L.; Johns, E.E.; Anderson, R.L.; Lewis, E.L.; Lamberger, P.H.; Vallee, R.E. *Fusion Technology (USA)*, 14(2): 876-883 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

A recent tritium inventory imbalance at Mound required an investigation into its causes. Much tritium was found as HTO in unsuspected zeolite traps of a T-purification system. Isotropic exchange from ammonia was postulated as a mechanism for entry of T into the zeolitic water. Gases from a T-processing system which had experienced air in-leakage were shown, by trapping of condensibles, to contain substantial H-isotropic waters and ammonias. Further evidence for tritiated ammonia was inferred from changes in pressure and T purity in otherwise unperturbed tanks of N_2 and $(H/D/T)_2$. From two such tanks which held N_2 and T_2 at equilibrium, ammonia was trapped and decomposed; a preliminary equilibrium constant for $N_2 + 3T_2 <> 2NT_3$ was determined. Controlled experiments by laser Raman spectrometry are in progress to investigate N_2/T_2 equilibria and kinetics. Results for gas mixtures in the 60 - 130 kPA (500 - 1000 torr) range (per reactant) suggest that forward rate and the equilibrium attained are proportional to $[T_2]$. G-values for NT_3 production were ~1 - 2 molecules $atm^{-1}(T_2)$ $(100eV)^{-1}$. Self-decomposition of NT_3 proceeded in an exponential decay with a G = 15 - 30. A lower value was observed at pressures where β^--absorption in the gas was poor.

44330 Synthesis and stability of liquid molecular DT. Pearon, E.M. (9513035); Garza, R.G.; Griffith, C.M.; Mayhugh, S.R.; Mapoles, E.R.; Sater, J.D.; Souers, P.C.; Tsugawa, R.T.; Gaines, J.R.; Collins, G.W. *Fusion Technology (USA)*, 14(2): 864-868 (Sep 1988). (CONF-880505–: 3. topical meeting on tritium technology in fission, fusion and isotopic applications, 1-6 May 1988).

Regular equimolar deuterium-tritium is a mixture of 25 mol% T_2-50% DT-25% D_2. The authors have synthesized molecular DT of greater purity by the reaction $LiT + CH_3OD \rightarrow DT + LiOCH_3$, run at 243 K. With both the alcohol and reactor-to-cryostat transfer lines at room temperature, they obtain the 88 mol% DT purity. By cooling the alcohol and holding the transfer lines at 80 K, the yield rose to 95% DT. The DT disproportionated to D_2 and T_2 with a 1/e time constant of about 100 hr in the liquid at 20.5 K. Nuclear magnetic resonance data showed that the eventual T_2-DT-D_2 equilibrium is probably a hot-atom one.

44331 Triton memory time in solid DT and its nuclear polarization. Souers, P.C. (9513035); Fearon, E.M.; Mapoles, E.R.; Gaines, J.R.; Sater, J.D.; Collins, G.W.; Sherman, R.H.; Bartlit, J.R. *Fusion Technology (USA)*, 14(2): 855-863 (Sep 1988).

The expected value of nuclear spin polarization to inertial confinement fusion is recapitulated. A comparison of brute force polarization versus dynamic nuclear polarization, as applied to solid deuterium-tritium, is given, and the need for a long triton polarization memory time (longitudinal nuclear relaxation time) is shown. The time constant for 25 mol%T_2-50 DT-25 D_2 (D-T) is a short 0.3 s at 5 K and waiting in the presence of tritium radioactivity lowers it to 0.1 s. Enriched 90 to 96% molecular DT has been synthesized and held 3 to 4 hours at 10 K, which lowers the overall J = 1 T_2 concentration to about 0.1%. The resulting memory time can be raised in this way to 0.7 to 0.8 s. These samples were then melted and nH_2 added, which increased the memory times to 6 to 8 s - an increase of twenty-fold over regular D-T at 5 to 6 K. The theory shows that the species shortening the triton memory time is the J = 1 T_2, which can be reduced in our samples only by radioactive self-catalysis. Cryogenic distillation is considered as a possible means of removing the J = 1 T_2 from molecular DT.

In 1984, the section made significant contributions to the state of knowledge and technology in several areas such as; conducting polymers for advanced batteries, separation of hydrogen isotopes by chromatographic methods, ion exchange resin performance in nuclear circuits, decontamination processes, concentration mechanisms and corrosion processes under deposits in nuclear steam generators, steam generator chemical cleaning, and processes for immobilizing high level liquid wastes. New work was started in a variety of areas such as applications of plasma technology and electrochemistry in chemical processes, dew point measurement and molecular sieve drier technology in nuclear applications, and limestone injection for sulphur dioxide removal from stack gases. Ongoing capabilities in combustion research and environmental aspects of solid waste disposal and wastewater treatment were also maintained. Most of these programs will continue in 1985.

44335 (AECL–8848) **Progress report - Health Sciences Division - 1985 January 01 - June 30.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Sep 1985. 121p. (PR-HS–19). Order Number DE89635688/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

This progress report contains a topical summary of major research in the Health Sciences Division. Separate reports are included for each of the following branches: Dosimetric Research, Environmental Research, Radiation Biology, and Medical. Some of the main areas of interest discussed are the impact of studies on cultured human fibroblasts with abnormal carcinogen sensitivity. This includes mechanisms of DNA repair and for the initiation of cancer, contribution of such genes to overall societal cancer burden, impact on risk assessment, distribution of risk, and radiation protection, application to improved treatment of cancer, screening for abnormal carcinogen sensitivity and Roberts syndrome.

44336 (AECL–9681) **Progress report Physics and Health Sciences. Health Sciences section. 1987 July 01-December 31.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Mar 1988. 141p. (PR-PHS-HS–4). Order Number DE89620467/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

This report covers the fourth semi-annual period since the Research Company was reorganized. We now have eight research fellows on staff, six fully funded by Physics and Health Sciences (P and HS). The first section of this report contains an excellent topical review of the program in Health Sciences on tritium toxicity which involves scientists from all three of the Chalk River branches of Health Sciences. Their work on cancer proneness is expanding data on apparently normal people and has been extended to include cancer patients. All tests are now blind. The work was the subject of two very fine TV presentations, one each shown on the

French and English networks of the CBC. Investigation also continues on the complex influence of hyperthermia on cancer induction and promotion. The potency of natural killer cells in human blood which have the ability to recognize and destroy cancerous cells have been shown to be very sensitive to temperature. A method may have been found for extending the life of T-lymphocytes grown in culture beyond the present 30 to 60-day limit. Activities in environmental research are moving in the direction of studies of a more fundamental nature so that the results will have a certain portability. Model studies form a large part of this new emphasis and notable among those is the Twin Lakes tracer study. Work is in progress to follow the plume the full 240 metres to the discharge zone with considerable success in the mathematical modelling. Members of the Health Sciences unit at CRNL were active as resource people for the Hare Commission on Ontario Nuclear Safety Review during the late fall. At Partnerships for Profit, which brought 85 senior executives of Canadian business in contact with the Research Company's capabilities, Physics and Health Sciences manned four booths on cancer screening, environmental protection, ANDI and nuclear physics instrumentation.

44337 (CNEA-NT–41/87) **Annual report 1985 Chemistry Department.** Comision Nacional de Energia Atomica, Buenos Aires (Argentina). 1987. 108p. (In Spanish). (CNEA-D-Q–6). Order Number DE89620468/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

This annual report describes the activities carried out in 1985 by the Chemistry Department in the following fields: Chemistry, Inorganic Chemistry, Physicochemistry (Interphases, Surfaces), General Chemical Analysis, Active Materials Analysis, X Ray Fluorescence Analysis, Mass Spectroscopy (Isotopic Analysis, Instrumentation) and Optical Spectroscopy. A list of publications is enclosed. (M.E.L.).

44338 (IAE–4719/3) **Main trends in research and development works of nuclear centres in USA, UK, France, FRG and Japan. Pt. 2 Uk, France, FRG.** Ivanova, L.M.; Mironov, V.D.; Panin, V.I.; Sidorov, P.S.; Shkutov, V.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (USSR). Inst. Atomnoj Ehnergii. 1988. 48p. (In Russian). Order Number DE89635676/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

Data on composition, structure and scientific trends of main nuclear centers in Great Britain, France, FRG are systematized. Main tendencies for development of prior trends in atomic acience nucleonics are detected and national peculiarities of nuclear programs developed are determined as result of analysis of research and development works, budget allocations and staff of nuclear center. 12 refs.; 10 figs.; 7 tabs.

44339 (KFK–4530) **Annual report 1988 of the Central Safety Department.** Koelzer, W.; Urban, M. Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Hauptabteilung Sicherheit. Apr 1989. 233p. (In German). Order Number DE89911039/JAW. Available from NTIS (US Sales Only), PC A11/MF A01.

The Central Safety Department is responsible for handling all problems of radiation protection, safety and security of the institutes and departments of the Karlsruhe Nuclear Research Center, for waste water activity measurements and environmental monitoring of the whole area of the Center, and for research and development work mainly focusing on nuclear safety and radiation protection measures. The r+d work concentrates on the following aspects: physical and chemical behavior of biologically particularly active radionuclides, behavior of tritium in the air/plant/soil system, biophysics of multicellular systems, improvement in radiation protection measurement and personnel dosimetry. This report gives details of the different duties, indicates the results of 1988 routine tasks and reports about results of investigations and developments of the working groups of the Department. The reader is referred to the English translation of the Table of Contents and of Chapter 1 describing the duties and organization of the Central Safety Department. (orig./HP).

44340 (NIRS-AR–30) **Annual report of National Institute of Radiological Sciences of the fiscal year 1986.** National Inst. of Radiological Sciences, Chiba (Japan). Nov 1987. 260p. (In Japanese). Order Number DE89906672/JAW. Available from NTIS (US Sales Only), PC A12/MF A01.

In fiscal year 1986, this Institute was alloted the budget of 6.4 billion yen, 16 % more as compared with the previous year. It was for promoting the various facilities for internal exposure experiment, the basic design of a heavy particle beam cancer treatment apparatus, the additional construction of the cyclotron building and other various works. As the research activities, the results of high level were obtained in four special researches on tritium, probabilistic effect, exposure evaluation and heavy particles. The case of neutron therapy has reached 1500 cases, and the adaptation to the therapy became clearer. The 14th environment seminar was held in December with the title 'Dynamic analysis of contamination mechanism in marine living things'. Also the 18th symposium on 'New development in chromosome research' was held. Due to the Chernoby1-4 accident on April 26, the medical examination of the travelers to USSR was carried out at international airports, and the report was made. As the program of the Regional Cooperation Agreement of IAEA, the training course for radiation therapy and the cooperation with the research on the diagnostic techniques of nuclear medicine were carried out. 39 personnel carried out international activities, and 63 foreign researchers visited the Institute. (K.I.).

44341 (OH–85-20-K) **Nondestructive and fracture evaluation section. 1984 review and 1985 work program.** Baron, J.A. Ontario Hydro Research Lab., Toronto, ON (Canada). Feb 1985. 45p. Order Number DE89635677/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

The projects and achievements of the Nondestructive and Fracture Evaluation Section in 1984 are reviewed. Proposed projects and objectives for 1985 are described in outline.

44342 (OH–85-42-K) **Organic research section. 1984 review and 1985 programs.** Glass, R.W. Ontario Hydro, Toronto, ON (Canada). Research Center. Feb 1985. 29p. Order Number DE89635691/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This report reviews the major activities and accomplishments of the Organic Research Section in 1984 and presents the 1985 work program. The three major areas of the Section's research work are non-metallic materials which includes applications and uses of plastics, petroleum products, coatings and elastomers; reactor waste management; and activity transport/decontamination of nuclear systems. In 1984, 50% of the Section's resources were used on studies in support of nuclear generation, 13% on reactor waste, and 37% on general activities and work in support of utilization, transmission and distribution, and thermal and hydraulic programs. About 60% of the section's work was supported by transfer and revenue funds as a result of urgent short-term work requirements which resulted in 68% of the work falling into the technical investigation, consulting and testing categories.

44343 (AD-A–206046/5/XAB) **PRASE (Parallel Resource Analysis Software Environment) Instrumentation software for the Intel IPSC hypercube. Master's thesis.** Kahl, M.A. Air Force Inst. of Tech., Wright-Patterson AFB, OH (USA). School of Engineering. Dec 1988. 211p. (AFIT/GCS/ENG–88D-11). Available from NTIS, PC A10/MF A01.

PRASE (Parallel Resource Analysis Software Environment) , developed at the Air Force Institute of Technology to support local users, consists of a set of subroutines and programs that aid a user in monitoring parallel-processing software targeted for an Intel iPSC

Hypercube. PRASE was in many ways patterned after Seecube, an effort by Alva Couch and others at Tufts University in Massachusetts. Like Seecube, instrumentation code must be embedded in a user's source code to facilitate data collection. After data are collected, a translator may be used to translate PRASE data into Seecube format. This allows application-specific instrumentation. Preprocessors for both C and Fortran automatically embed necessary subroutine calls using a user-defined configuration file. The data-collection subroutines are written in C and can be called by both C and Fortran. Data collected during program execution can be held in Hypercube memory and written to disk at the end of a run, or dumped periodically to disk during a run which may aid in debugging.

44344 (AD-A–206208/1/XAB) **Prospects for classifying complex imagery using a self-organizing neural network. Project report.** Menon, M.M.; Heinemann, K.G. Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab. 11 Jan 1989. 31p. Available from NTIS, PC A03/MF A01.

The objective of this study is to evaluate the performance of Fukushima's Neocognitron model when it is applied to complex imagery. This system could discriminate between simple alphabetical characters represented in fields of 16 by 16 pixels, and that shift invariance can be achieved through a proper choice of design parameters. This work describes results for expanded Neocognitron architectures operating on complex images of 128 by 128 pixels. These neural network systems were simulated on a VAX-8600 minicomputer. Wire-frame models of three different vehicles were used to test the properties which Fukushima had demonstrated. The expanded Neocognitron systems were able to classify these objects and to identify their critical features. After training, each object was placed at different positions in the plane, and the Neocognitron's shift invariance property was tested. With complex (128 X 128) imagery, it was difficult to achieve proper classification and maintain shift invariance using only a few levels. In another experiment, the Neocognitron trained on polar transforms of objects in the training set. Objects in the training set were rotated, and polar transforms of the rotated images were submitted as input. In this manner, the Neocognitron's shift invariance was exploited to recognize rotated imagery. These investigations gave insight into the role of various model parameters and their proper values, as well as demonstrating the model's applicability to complex images.

44345 (AD-A–206284/2/XAB) **Structuring programs to support intelligent interfaces. Research report.** Szekely, P. University of Southern California, Marina Del Rey, CA (USA). Information Sciences Inst. Feb 1989. 25p. (ISI/RR–89-231). Available from NTIS, PC A03/MF A01.

The ability of connect user interface building blocks with a wide variety of application programs is crucial in the construction of intelligent interfaces. This paper presents a language to specify the communication between building blocks and application programs, with two important features: First, the language is abstract enough to isolate the application program from the details of particular interface styles. Second, the language is rich enough to support the communication of the information needed for the low-level aspects of the user interface. The paper also describes a UIMS(User Interface Management Systems) based on this language, and discusses how the language supports tools that can reason about the building blocks provided by the UIMS.

44346 (AD-A–206313/9/XAB) **Mapping for converting Mascot designs to ADA programs. Memorandum report.** Dean, T. Royal Signals and Radar Establishment, Malvern (UK). 19 Jul 1988. 24p. (RSRE-MEMO–4244). Available from NTIS, PC A03/MF A01.

The Future Networks section of CC1 division uses Mascot III in designing parallel systems. These designs are then implemented in the Ada programming language. A systematic method for mapping Mascot design into Ada programs has been developed, and this document describes the main characteristics of the method. In most applications, the mapping in its basic form is entirely adequate, and so a large part of the document is spent in describing this. However, certain situations present problems which can only be solved by making some alterations. Therefore, a short section on these problems and their solutions is also included. The method was chosen since it produces Ada programs with components corresponding directly to the Mascot design. This was considered a big advantage in producing maintainable and clear code. Mascot Templates (both algorithmic and structural) are represented as generic packages, and Mascot components are instantiations of those packages.

44347 (AD-A–206587/8/XAB) **Performance analysis of the DAP(trademark)-610 (Active Memory Technology's Distributed Array Processor) as data-compression processor in a real-time Remids system. Technical report, November 1988-March 1989.** Przebienda, L.M. Environmental Research Inst. of Michigan, Ann Arbor, MI (USA). Mar 1989. 29p. (ERIM–209700-1-T). Available from NTIS, PC A03/MF A01.

An analysis of the DAP 610 (Active Memory Technology's Distributed Array Processor) was undertaken to determine if the DAP-610 is capable of functioning as a major system component in a real-time processor. The evaluated functions required of the DAP-610 include: a direct link to an external multispectral sensor sending 16-bit data at a 1.65-MHz rate, demultiplexing and reformatting of sensor data, data compression processing, feature extraction, VME-bus input/output for communication with other system components, and out of high resolution image data for display. The DAP-610 was found to be capable of all these functions. However, processing-time estimates available are insufficient to verify that the implementations will operate within the real time constraints.

44348 (AD-A–206657/9/XAB) **Lexical analysis on a moderately sized multiprocessor. Technical report.** Low, J.R. Rochester Univ., NY (USA). Dept. of Computer Science. Oct 1988. 23p. (TR–261). Available from NTIS, PC A03/MF A01.

In the past few years, several computing systems have been developed that use traditional Von Neuman processors executing in parallel. These processors communicate at speeds which are only slightly slower than accesses to local memory. Communication is accomplished using message-passing and/or shared-memory techniques. These computers are described as MIMD (Multiple Instruction Multiple Data) machines. The term Moderately Sized Multiprocessor is used to describe MIMD systems that contain a moderate number (several dozen) of processors. Examples of such systems include the Cal Tech Cosmic-Cube, the NYU UltraComputer, the IBM, and the BBN Butterfly Computer. In this document a method for using dozens of conventional Von Nueman processors to tokenize programs in parallel is described. Results of a prototype implementation on the BBN Butterfly Computer are discussed.

44349 (AD-A–206852/6/XAB) **Learning in structured connectionist networks. Technical report.** Fanty, M.A. Rochester Univ., NY (USA). Dept. of Computer Science. Apr 1988. 99p. (TR–252). Available from NTIS, PC A05/MF A01.

Doctoral thesis.

Connectionist networks compute in a manner analogous to real neural networks. This work focuses on computing and especially learning in structured connectionist networks – those which emphasize problem-specific connection patterns as well as adaptive weight change rules. A connectionist chart parser was implemented which parses limited-length strings for context-free grammars in a constant number of parallel-computations steps. The parser was extended to disambiguate and complete near-miss parses, as well as learn new production in certain limited situations. While the parser works well, the structure is too rigid and learning too difficult for cognitive modeling. Two algorithms for learning simple, feature-based concept descriptions were also implemented. The first recruits hidden units representing pairs of features. The performance of this network is good when the definition involve pairs of input features, but attempts to build hierarchies of pair units for longer definitions were not successful. The second algorithm is an enhancement of an existing technique, competitive learning, adding feedback from concept units to guide the partitioning of inputs into classes. This technique is more successful and is used as a component in a network which is capable of learning descriptions of structured objects.

44350 (AD-A–206860/9/XAB) **Communication cost of sparse Cholesky factorization on a hypercube.** Gao, F.; Parlett, B.N. California Univ., Berkeley, CA (USA). Center for Pure and Applied Mathematics. Dec 1988. 15p. (PAM–436). Available from NTIS, PC A03/MF A01.

The authors consider the nested dissection ordering of a k x k grid of nodes and the Cholesky factorization of the associated k squared x k squared symmetric matrix. When the factorization is computed on a hypercube machine with p processors, then the communication cost (the total number of nonzero elements that need to be communicated among the processors) can be kept down to O (pk squared) when the processors are assigned appropriately. This result was proved in George, Liu and Ng (1987). The authors offer a simple proof of a slightly stronger result: the communication cost for each processor is O (k squared). Load balancing is built into the proof. Their argument extends to grids in more than 2 dimensions.

44351 (AD-A–206911/0/XAB) **Research on signal-processing supercomputers. Final technical report, September 1985-September 1986.** Kung, H.T. Carnegie-Mellon Univ., Pittsburgh, PA (USA). Dept. of Computer Science. Sep 1988. 48p. Available from NTIS, PC A03/MF A01.

Signal processing is an area where the required computational bandwidth in an application can be unbounded. Applications such as radar, sonar and communications already call for signal-processing systems capable of delivering billions or tens of billions of operations per second. In developing a new signal processor to meet these requirements, it is essential to understand the underlying computational models. An ad-hoc processor development effort that is unclear on the computational models will likely be wasteful and unable to meet the long-term performance goal. Fortunately, because the control in signal processing is typically data-independent, computational models in this area can be relatively simple. Based on the study performed under this contract, this report describes some important computational models for parallel signal processing, and illustrates how the Warp machine developed by Carnegie Mellon supports these models. (jes)

44352 (ANL/EES-TM–376) **Evaluation of computer-aided software engineering tools for data base development.** Woyna, M.A.; Carlson, C.R. Argonne National Lab., IL (USA). Energy and Environmental Systems Div. Feb 1989. 23p. Sponsored by U.S. Department of Defense. DOE Contract W-31109-ENG-38. Order Number DE89014007/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

More than 80 computer-aided software engineering (CASE) tools were evaluated to determine their usefulness in data base development projects. The goal was to review the current state of the CASE industry and recommend one or more tools for inclusion in the uniform development environment (UDE), a programming environment being designed by Argonne National Laboratory for the US Department of Defense Organization of the Joint Chiefs of Staff, J-8 Directorate. This environment gives a computer programmer a consistent user interface and access to a full suite of tools and utilities for software development. In an effort to identify tools that would be useful in the planning, analysis, design, implementation, and maintenance of Argonne's data base development projects for the J-8 Directorate, we evaluated 83 commercially available CASE products. This report outlines the method used and presents the results of the evaluation.

44353 (CERN–89-06) **1988 CERN school of computing. Proceedings.** Verkerk, C. (ed.). European Organization for Nuclear Research, Geneva (Switzerland). 25 Apr 1989. 482p. (CONF-8808259–: CERN school of computing, Oxford (UK), 15-26 Aug 1988). Order Number DE89633843/JAW. Available from NTIS (US Sales Only), PC A21/MF A01 - OSTI; INIS.

These Proceedings contain written versions of most of the lectures delivered at the 1988 CERN School of Computing. Five lecture series concerned different aspects of parallel and vector processing: advanced computer architectures; parallel architectures for neurocomputers; Occam and transputers; vectorization of Monte Carlo code; and vectorization of high-energy physics code. Software engineering was the topic of three series of lectures: formal methods for program design; introduction to software engineering; and tutorial lectures on structured analysis and structured design. Lectures on data-acquisition and recording were followed by lectures on new techniques for data analysis in high-energy physics. Computer-assisted design of electronic systems, and silicon compilation and design synthesis for digital systems, were the topic of two other, closely related, lecture series. Lectures on accelerator controls and on robotics are also recorded in these Proceedings. Various other aspects of computing were covered in lectures on high-speed networks document preparation systems, interpersonal communication using computers, and on Fortran 8x. Two general lectures gave an introduction to high-energy physics at CERN. (orig.).

44354 (CONF-8607100–, pp. 1-4) **Introduction to NEUROCON-I.** Dress, W.B. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA). May 1988. DOE Contract AC05-84OR21400. From NEUROCON 1 conference; 27-30 Jul 1986. In *NEUROCON-1: Proceedings.* Order Number DE88013108/JAW. Available from NTIS, PC A03/MF A01.

Interest in artificial neural systems modeled on natural intelligence has been largely dormant for about 30 years (except in the minds and dreams of a few mavericks). During that time artificial intelligence attempted to create ab initio software intelligence using higher-order cognitive constructs modeled by complex data structures. Now a renaissance of interest in biologically motivated computation has reached explosive proportions as measured by the rate of appearance of journal articles, books, and conferences such as this one. This renaissance was popularized by John Hopfield of Cal Tech, who provided some remarkable physical insights for understanding the functioning of highly abstract neural models. It is apparent that the time has come to heed the lessons learned by another dedicated group of researchers whose field is also undergoing a period of explosive growth - the neuroscientist. Understanding natural intelligence (including genetics and evolutionary principles) is essential if we ever wish to achieve intelligent machines. 4 references, 1 table.

44355 (CONF-8607100–, pp. 5-11) **Brain and neural-network simulations.** Browning, I. Oak Ridge National Lab., TN (USA). May 1988. From NEUROCON 1 conference; 27-30 Jul 1986. In *NEUROCON-1: Proceedings.* Order Number DE88013108/JAW. Available from NTIS, PC A03/MF A01.

The author approaches the subject from the standpoint of genetics, pointing out that the main difference between humans and lower animals life is a very simple genetic structure that caused over development of the human cortex. Further, he notes that, genetically, the heredity of an intelligent structure contains a lot less information than the structure itself. Experiments with Maitland Baldwin, chief neurosurgeon at NIH, are mentioned in which it was found that brain electrical output is not related to operation of the neurones. In his computerized simulation work at Sandia, he simplified the operating mechanism of the brain itself in order to get it into the computer. A neurone was something that counted and fired at some level. Each neurone had a number of synaptic inputs - a 1024-node net was used with an average of 12 synapse inputs per neurone. He found several kinds of paths in running this network. Since a pathway consisted of a learned time sequence concerning all permutations of connections, he concluded that the number of bits a neural network could hold was a combinatorial. 1 reference, 2 figures, 1 table.

44356 (CONF-8607100–, pp. 13-16) **Neural network modeling of individual propagation delays.** Knisley, J.R. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA). May 1988. DOE Contract AC05-84OR21400. From NEUROCON 1 conference; 27-30 Jul 1986. In *NEUROCON-1: Proceedings.* Order Number DE88013108/JAW. Available from NTIS, PC A03/MF A01.

The Hopfield neural network is limited in application due to unwanted local minima, which trap the network as it settles to steady states. Most attempts at handling these unwanted local minima have involved probabilistic weighting or random noise that bumps the network out of local minima. This paper suggests a deterministic method for handling local minima, based on a property of actual neurons. Computer simulations of a modified Hopfield network with artificial neurons were made. Experimental results and observations are discussed. 5 references.

44357 (CONF-8607100–, pp. 17-23) **Comparison of three neural-network models.** Matheus, C.J. (Univ. of Illinois at Urbana-Champaign (USA)). Oak Ridge National Lab., TN (USA). May 1988. From NEUROCON 1 conference; 27-30 Jul 1986. In *NEUROCON-1: Proceedings.* Order Number DE88013108/JAW. Available from NTIS, PC A03/MF A01.

This paper presents briefly a comparison of the following computational neural networks: (1) the Rumelhart and Zipser Model; (2) the Boltzmann Machine; and (3) the Hopfield Network. With so few available machines to implement neural networks in parallel and so few practical neural systems in use, the most-promising approach found for making immediate use of neural networks on serial machines for pattern recognition is the Hopfield Network. The reasons are that the model is easy to implement, it has a simple and efficient threshold function, there exists a simple and fast learning procedure for storing memory states, and it is very effective as an associative memory. The Rumelhart and Zipser model is appealing in its ability to create new features based on experience with its environment; however, it could not be seen how these low-level features could be effectively integrated into a practical high-level system without a considerable effort. The Boltzmann Machine offers the potential for solving difficult constraint satisfaction problems with neural networks. However, because it uses a simulated annealing process, it is prohibitively slow for most practical applications. With the increased availability of massively parallel architectures, however, this and other approaches may soon find a place among more traditional problem-solving techniques. 7 references.

44358 (CONF-8607100–, pp. 25-41) **Neural network modeling of early retinal vision processes.** Jorgensen, C.C. (Oak Ridge National Laboratory, TN (USA)). Oak Ridge National Lab., TN (USA). May 1988. DOE Contract AC05-84OR21400. From NEUROCON 1 conference; 27-30 Jul 1986. In *NEUROCON-1: Proceedings*. Order Number DE88013108/JAW. Available from NTIS, PC A03/MF A01.

This paper considers two techniques to obtain values for parameters in models of vision processes in early layers of the human retina. The work is part of a long-term effort to develop a robot vision system using three computational principles of neural networks. These principles are massive parallelism, dynamic feedback, and multilayer pattern recognition. Two network models were studied. The first represented lateral inhibition processes as a matrix of two-dimensional linear equations with limited feedback. The second represented multilayer networks as matrices of dynamic, two-dimensional nonlinear differential equations. The lateral inhibition model was parameterized using psychophysical data from human judgments of pattern brightness in a machband illusion. A 2-D Fourier transform was mode of original and perceived patterns and used to solve for the coefficient matrix of the neural network. The coefficients were then applied to the pixel matrix of a Herman Grid illusion and compared with the corresponding human subjective results through three-dimensional plots of pixel intensities. The second model was analyzed using a new computer simulation developed to work with moving images and adjustable neural connection topologies. 19 references, 8 figures.

44359 (DOE/ER/25009–681b) **3-D asteroids using parallel graphics on NCUBE: A testbed for evaluating controller algorithms.** Ho, A.; Fox, G.; Snyder, S.; Chu, D.; Mylner, T. California Inst. of Tech., Pasadena, CA (USA). 18 Apr 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-85ER25009. (CONF-890372–15: 4. hypercube, concurrent computers and applications, Monterey, CA (USA), 6-8 Mar 1989). Order Number DE89016382/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

We have implemented on NCUBE a 3-D Asteroids video game system. The system functions as a testbed for evaluating intelligent controller algorithms within a simulated space battle framework. The Asteroids features battle of spacecrafts in a 3-D toroidal space with inert meteorites of various sizes. It supports multi-players and mixed communication protocols. The game can be played either in interactive or batch mode. In interactive mode a player can maneuver a spacecraft by keyboard or graphics tablet control like a regular pc-based video game. 3-D visual display of the game uses the NCUBE Real-Time Parallel Graphics Board which has 16 NCUBE processors and a Hitachi HD63484 drawing/video chip. In batch mode spacecrafts can be controlled by user-supplied software controllers. The modular structure of the game allows easy replacement of game objectives, game rules, and spacecraft controllers. The flexibility of module substitution allows fast prototyping of different controller strategies and algorithms which are constrained by various game rules. The system also allows algorithms that run on distinct subcubes of a hypercube to compete with one another. 6 refs., 1 fig.

44360 (DOE/ER/25009–695) **Neural networks and dynamic complex systems.** Fox, G.; Furmanski, Wojtek; Ho, Alex; Koller, J.; Simic, P.; Wong, Isaac. California Inst. of Tech., Pasadena, CA (USA). 1989. 16p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-85ER25009. (CONF-890360–6: Eastern multiconference, Tampa, FL (USA), 28-31 Mar 1989). Order Number DE89016380/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

We describe the use of neural networks for optimization and inference associated with a variety of complex systems. We show how a string formalism can be used for parallel computer decomposition, message routing and sequential optimizing compilers. We extend these ideas to a general treatment of spatial assessment and distributed artificial intelligence. 34 refs., 12 figs.

44361 (DOE/ER/25009–769) **1989 – the first year of the parallel supercomputer.** Fox, G.C. California Inst. of Tech., Pasadena, CA (USA). 6 Jun 1989. 38p. Sponsored by U.S. DOE Energy Research. DOE Contract FG03-85ER25009. (CONF-890372–14: 4. hypercube, concurrent computers and applications, Monterey, CA (USA), 6-8 Mar 1989). Order Number DE89016373/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Parallel Computing has come of age with several commercial and in- house systems available which not only promise, but realize supercomputer or better performance. We survey several major computations underway on hypercubes, transputer arrays and the SIMD Connection Machine CM-2 and AMT DAP. Where possible, we compare parallel implementations with those on CRAY and other high performance conventional computers. We summarize these experiences as a set of lessons for applications, decomposition, performance, hardware and software for parallel machines. 94 refs., 18 figs., 9 tabs.

44362 (FNAL/C–89/120) **Event parallelism: Distributed memory parallel computing for high energy physics experiments.** Nash, T. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 20p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890415–10: Computing in high energy physics, 10-14 Apr 1989). Order Number DE89016285/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This paper describes the present and expected future development of distributed memory parallel computers for high energy physics experiments. It covers the use of event parallel microprocessor farms, particularly at Fermilab, including both ACP multiprocessors and farms of MicroVAXES. These systems have proven very cost effective in the past. A case is made for moving to the more open environment of UNIX and RISC processors. The 2nd Generation ACP Multiprocessor System, which is based on powerful RISC systems, is described. Given the promise of still more extraordinary increases in processor performance, a new emphasis on point to point, rather than bussed, communication will be required. Developments in this direction are described. 6 figs.

44363 (FNAL/C–89/130) **FEREAD: Front End Readout software for the Fermilab PAN-DA data acquisition system.** Dorries, T.; Haire, M.; Moore, C.; Pordes, R.; Votava, M. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 6p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–11: 6. conference on real-time computer applications in nuclear, particle and plasma physics, 15-18 May 1989). Order Number DE89016333/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The FEREAD system provides a multi-tasking framework for controlling the execution of experiment specific front end readout processes. It supports initializing the front end data acquisition hardware, queueing and processing readout activation signals, cleaning up at the end of data acquisition, and transferring configuration parameters and statistical data between a "Host" computer and the readout processes. FEREAD is implemented as part of the PAN-DA software system and is designed to run on any Motorola 68k based processor board. It has been ported to the FASTBUS General Purpose Master (GPM) interface board and the VME MVME133A

processor board using the pSOS/Microtec environment. 12 refs., 2 figs.

44364 (FNAL/C–89/131) **A real time integrated environment for Motorola 680xx-based VME and FASTBUS modules.** Berg, D.; Heinicke, P.; MacKinnon, B.; Nicinski, T.; Oleynik, G. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–9: 6. conference on real-time computer applications in nuclear, particle and plasma physics, Williamsburg, VA (USA), 15-18 May 1989). Order Number DE89015238/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Software Components Group pSOS operating system kernel and pROBE debugger have been extended to support the Fermilab PAN-DA system for a variety of Motorola 680xx-based VME and FASTBUS modules. These extensions include: a multi-tasking, reentrant implementation of Microtec C/Pascal; a serial port driver for terminal I/O and data transfer; a message reporting facility; and enhanced debugging tools. 5 refs., 1 fig.

44365 (FNAL/C–89/132) **Exabyte helical scan devices at Fermilab.** Constanta-Fanourakis, P.; Kaczar, K.; Oleynik, G.; Petravick, D.; Votava, M.; White, V.; Hockney, G.; Bracker, S.; de Miranda, J.M. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–10: 6. conference on real-time computer applications in nuclear, particle and plasma physics, Williamsburg, VA (USA), 15-18 May 1989). Order Number DE89015237/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Exabyte 8mm helical scan storage devices are in use at Fermilab in a number of applications. These devices have the functionality of magnetic tape, but use media which is much more economical and much more dense than conventional 9 track tape. 6 refs., 3 figs.

44366 (FNAL/C–89/133) **Uniform communications software using TCP/IP.** Bernett, M.; Oleynik, G. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–13: 6. conference on real-time computer applications in nuclear, particle and plasma physics, 15-18 May 1989). Order Number DE89016332/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Data acquisition applications at Fermilab require a reliable, distributed communication system for downloading, diagnostics, control, and data distribution. TCP/IP over Ethernet was chosen because of its uniform user interface and commercial availability for a number of processors and operating systems. This paper describes our software and hardware support for TCP/IP on VAX/VMS, VME/pSOS, FASTBUS/pSOS, and Unix systems. It includes plans to provide a portable, hardware independent implementation of TCP/IP based on Berkeley BSD software. 8 refs., 3 figs.

44367 (FNAL/C–89/134) **Software for FASTBUS and Motorola 68K based readout controllers for data acquisition.** Pordes, R.; Bernett, M.; Dorries, T.; Haire, M.; Moore, C.; Oleynik, G.; Votava, M. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–14: 6. conference on real-time computer applications in nuclear, particle and plasma physics, 15-18 May 1989). Order Number DE89016330/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Many High Energy Physics experiments at Fermilab are now including FASTBUS front-ends in their data acquisition systems. The requirements on controllers to readout and control these FASTBUS systems are increasing in complexity and speed. The Data Acquisition Software group has designed general software for front end 68K processor boards housed in FASTBUS or VME to meet these needs. The first implementation has been developed for the General Purpose FASTBUS Master (GPM). This software is being ported to the FASTBUS Smart Crate Controller under development at Fermilab. The software is designed, using structured analysis tools and coding in C, to be easily portable in the future to new processor boards. As part of our extended support for FASTBUS, we have enhanced our software for the intelligent LeCroy 1821 FASTBUS interface and implemented the FASTBUS standard routines for the VAX/VMS operating system. 17 refs.

44368 (FNAL/C–89/135) **Remote procedure execution software for distributed systems.** Petravick, D.L.; Berman, E.F.; Sergey, G.P. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 4p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–15: 6. conference on real-time computer applications in nuclear, particle and plasma physics, Williamsburg, VA (USA), 15-18 May 1989). Order Number DE89016329/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

Remote Procedure Execution facilitates the construction of distributed software systems, spanning computers of various types. Programmers who use the RPX package specify subroutine calls which are to be executed on a remote computer. RPX is used to generate code for dummy routines which transmit input parameters and receive output parameters, as well as a main program which receives procedure call requests, calls the requested procedure, and returns the result. The package automatically performs datatype conversions and uses an appropriate connection oriented protocol. Supported operating systems/processors are VMS(VAX), UNIX(MIPS R2000, R3000) and Software Components Group's pSOS (680x0). Connection oriented protocols are supported over Ethernet (TCP/IP) and RS232 (a package of our own design). 2 refs., 2 figs.

44369 (FNAL/C–89/136) **The PAN-DA data acquisition system.** Petravick, D.; Berg, D.; Berman, E.; Bernett, M.; Constanta-Fanourakis, P.; Dorries, T.; Haire, M.; Kaczar, K; MacKinnon, B.; Moore, C.; Nicinski, T.; Oleynik, G.; Pordes, R.; Sergey, G.; Votava, M.; White, V. Fermi National Accelerator Lab., Batavia, IL (USA). May 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–12: 6. conference on real-time computer applications in nuclear, particle and plasma physics, 15-18 May 1989). Order Number DE89016328/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Online and Data Acquisition software groups at Fermi National Accelerator Laboratory have extended the VAXONLINE data acquisition package to include a VME based data path. The resulting environment, PAN-DA, provides a high throughput for logging, filtering, formatting and selecting events. 10 refs., 1 fig.

44370 (FNAL/C–89/142) **PAW [Physics Analysis Workstation] at Fermilab: CORE based graphics implementation of HIGZ [High Level Interface to Graphics and Zebra].** Johnstad, H. Fermi National Accelerator Lab., Batavia, IL (USA). Jun 1989. 8p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890415–9: Computing in high energy physics, 10-14 Apr 1989). Order Number DE89016327/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Physics Analysis Workstation system (PAW) is primarily intended to be the last link in the analysis chain of experimental data. The graphical part of PAW is based on HIGZ (High Level Interface to Graphics and Zebra), which is based on the OSI and ANSI standard Graphics Kernel System (GKS). HIGZ is written in the context of PAW. At Fermilab, the CORE based graphics system DI-3000 by Precision Visuals Inc., is widely used in the analysis of experimental data. The graphical part of the PAW routines has been totally rewritten and implemented in the Fermilab environment. 3 refs.

44371 (FNAL/C–89/143) **Physics analysis workstation.** Johnstad, H. Fermi National Accelerator Lab., Batavia, IL (USA). Jun 1989. 5p. Sponsored by U.S. DOE Energy Research. DOE Contract AC02-76CH03000. (CONF-890545–16: 6. conference on real-time computer applications in nuclear, particle and plasma physics, 15-18 May 1989). Order Number DE89016324/JAW. Available from NTIS, PC A02/MF A01 - OSTI; GPO Dep.

The Physics Analysis Workstation (PAW) is a high-level program providing data presentation and statistical or mathematical analysis. PAW has been developed at CERN as an instrument to assist physicists in the analysis and presentation of their data. The program is interfaced to a high level graphics package, based on basic underlying graphics. 3-D graphics capabilities are being implemented. The major objects in PAW are 1 or 2 dimensional binned

event data with fixed number of entries per event, vectors, functions, graphics pictures, and macros. Command input is handled by an integrated user interface package, which allows for a variety of choices for input, either with typed commands, or in a tree structure menu driven mode. 6 refs., 1 fig.

44372 (IKE–4-126) **Construction of an integrated system to solve partial differential equations on vector computers.** Mayer, R.P. Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme. Dec 1988. 148p. (In German). Order Number DE89795971/JAW. Available from NTIS (US Sales Only), PC A07/MF A01; NTIS (US Sales Only), PC A07/MF A01.

This study deals with a system of programs which includes the latest developments of soft- and hardware and numerics. It enables the user to solve any system of partial differential equations, on the basis of the finite-element-method. FEPDES (Finite Element Partial Differential Equation Solver) is set up in a modular manner and is structured according to the rules of software engineering. The algorithmis can be run efficiently on a modern vector or parallel computer. Depending on the particular problem direct, iterative and hybride algorithms are available for the solution of linear systems of equations. FEPDES was validated by using examples of the fields of heat conduction, fluid mechanics and structural mechanics. Due to the modular structure and the numerical methods it is possible to assign the single steps of a FEPDES run to several computers. Preparation of input and interpretation of results can therefore be run easily on a workstation with advanced interactive and grafic capabilities. However, the more extensive set up and the solution of matrix equations can be run optionally on the workstation or on a highspeed-computer like the CRAY, respectively. (orig.).

44373 (LA–11448-MS) **Learning to use the finite-element mesh generator, ESCHER 3.2.** Oakes, W.R. Jr. Los Alamos National Lab., NM (USA). Aug 1989. 100p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. Order Number DE89015885/JAW. Available from NTIS, PC A05/MF A01 - OSTI; GPO Dep.

ESCHER is a finite-element mesh generator designed to generate valid and well proportioned two-dimensional and three-dimensional meshes. It is intended for use in a loosely integrated analysis system. Edge-geometry data can be input to ESCHER from almost any computer-aided drafting program used today. ESCHER produces a finite-element model in a neutral file format that can be translated for input to specific finite-element analysis codes. This report describes how to use ESCHER. It explains what constitutes a valid geometrical model, how to construct one from edge geometry, how to define a finite-element model given a geometrical model, and how to verify that the created model is valid. The computer-hardware system required is explained, and ESCHER's relationship to other computer codes in the Integrated Design Engineering Analysis Library, IDEAL, is discussed. 5 refs., 11 figs.

44374 (LA-UR–89-2255) **Optimization of the constrained algebraic reconstruction technique for the performance of a variety of visual tasks.** Hanson, K.M. Los Alamos National Lab., NM (USA). 1989. 16p. Sponsored by U.S. DOE Defense Programs. DOE Contract W-7405-ENG-36. (CONF-890605–1: 11. international processing in medical imaging international conference, Berkeley, CA (USA), 19-23 Jun 1989). Order Number DE89015239/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

This work demonstrates the application of a method to optimize image reconstruction algorithms on the basis of the performance of specific visual tasks that are to be accomplished using the reconstructed images. The evaluation of task performance is numerically realized by a Monte Carlo simulation of the complete imaging chain, including the final inference based on the reconstructions. Fundamental to this evaluation is that it yields an average response by consideration of many initial scenes. It is shown that the use of the nonnegativity constraint in the Algebraic Reconstruction Technique can significantly improve performance in situations where there is a severe lack of measurements when the relaxation factor is optimized. There is no indication in any of the cases studied hitherto that the nonnegativity constraint can improve performance in situations where the data are complete, but noisy. 10 refs., 5 figs.

44375 (PB–89-183669/XAB) **Towards a parallel algorithm for the many-body problem.** Esselink, K. Groningen Rijksuniversiteit (Netherlands). Subfaculteit Wiskunde en Informatica. 1988. 24p. (CS–8813). Available from NTIS, PC EE03/MF A01.

This paper reports on research done in order to find out whether a known sequential algorithm for the Many Body Problem was suitable for parallelization. The sequential algorithm as a time complexity believed to be O(N log N). The main issue is how to transform the algorithm into an efficient parallel one. The problem of how to distribute the work evenly among the different processors for this particular problem is considered. Also the data structure plays an important role. Since the structure tends to be very big for a problem like this, special constructs are necessary to manage it while it is distributed among various processors. Some results from tests with not-many-but-still-a-lot-of-bodies on a 16-Transputer System are shown and suggestions on how to proceed and improve the algorithm are given. The work presented is just an example of how to approach a large parallel computing task.

44376 (PB–89-185409/XAB) **Vector-processing performance on the Delft Parallel Processor.** Andriessen, J.H.M.; Brok, S.W.; Pasveer, F.J. Technische Hogeschool Delft (Netherlands). Dept. of Mathematics and Informatics Computer Science. 1988. 27p. (REPT–88-96). Available from NTIS, PC EE03/MF A01.

The applicability and performance of vector processing on the Delft Parallel Processor (DPP) are considered. With respect to the performance, primarily the effects of the parallel implementation of algorithms and of the architecture of the DPP are analyzed. In many engineering problems, the mathematical formulation leads to the solution of very large systems of linear equations: Ax=b. The DPP will be used to solve such systems. Therefore the relative performance of some well-known iterative methods (Conjugate Gradient, Gauss-Seidel and modified Wang) are examined. The DPP is an MIMD-multiprocessor. The present DPP at the Delft Computing Center comprises 16 Processing Elements (PEs). To speed up the data processing, the PEs are equipped with Vector Processing Units. Each PE can handle vectors within the order of 1000 elements.

44377 (PB–89-864235/XAB) **Parallel processing. July 1985-May 1988 (Citations from the NTIS data base). Report for July 1985-May 1988.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 121p. Available from NTISPC N01/MF N01.

This bibliography contains citations concerning theoretical analyses and applications of parallel processing systems and operations. Topics include image and signal processing, programming languages, algorithm and architecture descriptions, and utilization in optimization problems. Descriptions of specific machines used in problem-solving systems are presented. (This updated bibliography contains 248 citations, none of which are new entries to the previous edition.)

44378 (PB–89-864243/XAB) **Parallel processing. June 1988-June 1989 (Citations from the NTIS data base). Report for June 1988-June 1989.** National Technical Information Service, Springfield, VA (USA). Jun 1989. 176p. Available from NTISPC N01/MF N01.

Supersedes PB–88-864152. See also PB–89-864235.

This bibliography contains citations concerning theoretical analyses and applications of parallel processing systems and operations. Topics include image and signal processing, programming languages, algorithm and architecture descriptions, and utilization in optimization problems. Descriptions of specific machines used in problem-solving systems are presented. (This updated bibliography contains 340 citations, all of which are new entries to the previous edition.)

44379 (SAND–88-1432) **BLOT: A mesh and curve plot program for the output of a finite element analysis.** Gilkey, A.P.; Glick, J.H. Sandia National Labs., Albuquerque, NM (USA). Jun 1989. 143p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. Order Number DE89013994/JAW. Available from NTIS, PC A07/MF A01 - OSTI; GPO Dep.

BLOT is a graphics program for post-processing of finite element analysis output that is presented in the EXODUS database format. It is command driven with free-format input and can drive any graphics device supported by the Sandia Virtual Device Interface.

BLOT produces mesh plots with various representations of the analysis output variables. The major mesh plot capabilities are deformed mesh plots, line contours, banded contours, vector plots of two or three variables (e.g., velocity vectors), and symbol plots of scalar variables (e.g., temperature). Pathlines of analysis variables can also be drawn on the mesh. BLOT's features include element selection by material, element birth and death, multiple views for combining several displays on each plot, symmetry mirroring, and node and element numbering. BLOT can also produce X-Y curve plots of the analysis variables. BLOT generates time-versus-variable plots or variable-versus-variable plots. It also generates distance versus-variable plots at selected time steps where the distance is the accumulated distance between pairs of nodes or element centers. 14 refs.

44380 (SAND–89-0466) **The Product Data Network and Distributed Data System: Node configuration.** Hall, R.C. Sandia National Labs., Albuquerque, NM (USA). Jul 1989. 39p. Sponsored by U.S. DOE Management & Administration. DOE Contract AC04-76DP00789. Order Number DE89013996/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Prototype systems have been established which prove the concept and utility of supporting distributed access to shared Product Test Data from Sandia National Laboratories (SNL) and General Electric Neutron Devices (GEND) using existing network communications facilities. It is essential, however, that adequate control (audit and isolation) be present as intrinsic characteristics of this connectivity in the production environment. A plan has emerged to put into place a configuration which provides required network functionality, yet preserves the necessary control. This configuration supports further development of a Product Data Network containing a Distributed Data System. We anticipate a complete "black hat" assessment of the final plan and configuration which results from these efforts. 3 figs.

44381 (SKB-TR–89-19) **A Bayesian nonparametric estimation of distributions and quantiles.** Poern, K. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Nov 1988. 22p. Order Number DE89912026/JAW. Available from NTIS (US Sales Only), PC A03/MF A01.

The report describes a Bayesian, nonparametric method for the estimation of a distribution function and its quantiles. The method, presupposing random sampling, is nonparametric, so the user has to specify a prior distribution on a space of distributions (and not on a parameter space). In the current application, where the method is used to estimate the uncertainty of a parametric calculational model, the Dirichlet prior distribution is to a large extent determined by the first batch of Monte Carlo-realizations. In this case the results of the estimation technique is very similar to the conventional empirical distribution function. The resulting posterior distribution is also Dirichlet, and thus facilitates the determination of probability (confidence) intervals at any given point in the space of interest. Another advantage is that also the posterior distribution of a specified quantile can be derived and utilized to determine a probability interval for that quantile. The method was devised for use in the PROPER code package for uncertainty and sensitivity analysis. (orig.).

44382 Vectorizing compilers. Callahan, D. (Computer Science Dept., Rice Univ., Houston, TX (US)); Dongarra, J.; Levine, D. pp. 460 of Proceedings of IEEE supercomputing '88. IEEE Service Center, Piscataway, NJ (1988). (CONF-881112–: IEEE supercomputing '88, Orlando, FL (USA), 14-18 Nov 1988).

This report describes a collection of 100 Fortran loops used to test the effectiveness of an automatic vectorizing compiler. The authors present the results of compiling these loops using commercially available vectorizing Fortran compilers on a variety of supercomputers, mini-supercomputers, and mainframes.

44383 Some computational aspects of three-dimensional transient solid dynamics. Taylor, L.M. (Applied Mechanics Div. III, Sandia National Lab., Albuquerque, NM (US)); Flanagan, D.P. vp. of Advanced topics in finite element analysis. Cory, J.F.; Gordon, J.L. American Society of Mechanical Engineers, New York, NY (1988). (CONF-8806216–: Advanced topics in finite element analysis, 19-23 Jun 1988).

Many transient dynamic analysis programs employ explicit time integration with a lumped (diagnolized) mass matrix. These programs predict the response of solids to intense dynamic loads, such as crash, penetration, or explosive loads. The explicit integration architecture avoids the solution of coupled matrix equations, which is of great advantage in these highly nonlinear problems. Explicit integration algorithms are naturally well suited to both vector and concurrent processing. However, to realize the advantage of concurrent vector processors, many traditional schemes for managing finite element data in memory must be changed. Optimal performance requires vectorization of as much codes as possible; one cannot afford to sacrifice vectorization for concurrency.

44384 Considerations involved in the display of finite element results using animation. Gwinn, K.W. (Applied Mechanics Dept., Sandia National Labs., Albuquerque, NM (US)); Koteras, J.R. vp. of Advanced topics in finite element analysis. Cory, J.F.; Gordon, J.L. American Society of Mechanical Engineers, New York, NY (1988). (CONF-8806216–: Advanced topics in finite element analysis, 19-23 Jun 1988).

The use of high-end graphics device is one useful means of interpreting the complex results from numerical analyses. Generation of animation sequences is another useful tool for examining results. In the past, movie film has served as the basis for generation of animation sequences. Processing and editing of film has proved to be a cumbersome process. Video is an alternative which eliminates some of the problems of film. However, computer animation and video must be carefully integrated if the high quality of the computer animation is to be preserved. This paper discusses the various considerations which must be made when video is used as a basis for generation of animation sequences for numerical analyses.

44385 Using Linda for supercomputing on a local area network. Whiteside, R.A. (Dept. of Computer Science, Yale Univ., P.O. Box 2158 Yale Station, New Haven, CT (US)); Leichter, J.S. pp. 460 of Proceedings of IEEE supercomputing '88. IEEE Service Center, Piscataway, NJ (1988). (CONF-881112–: IEEE supercomputing '88, Orlando, FL (USA), 14-18 Nov 1988).

A distributed parallel processing system based on the Linda programming constructs has been implemented on a local area network of computers. This system allows a single application program to utilize many machines on the network simultaneously. Several applications have been implemented on the network at Sandia National Laboratories and have achieved performances considerably faster than that of a Cray-1S. Several collections of machines have been used including up to eleven DEC VAXes, three Sun/3 workstations, and a PC.

44386 Profiles in mass storage. Collins, B. (Computing and Communications Div., Los Alamos National Lab., Los Alamos, NM (US)); Devaney, M.; Kitts, D. pp. 460 of Proceedings of IEEE supercomputing '88. IEEE Service Center, Piscataway, NJ (1988). (CONF-881112–: IEEE supercomputing '88, Orlando, FL (USA), 14-18 Nov 1988).

The Los Alamos Common File System (CFS) and the NCAR Mass Storage System (MSS) are file storage and file management systems that serve heterogeneous computing networks of supercomputers, general purpose computers, scientific workstations and personal computers. This paper details philosophical, implementation and performance aspects of the two mass storage systems. Areas covered include the computing environment, the user interface, storage strategies and file movement strategies.

44387 The birth of the second generation. Eoyang, C. (Institute for Supercomputing Research, 8F Recruit Kachidoki Bldg., 2-11 Kachidoki, Chuo-ku, Tokyo (JP)); Mendez, R.H.; Lubeck, O.M. pp. 460 of Proceedings of IEEE supercomputing '88. IEEE Service Center, Piscataway, NJ (1988). (CONF-881112–: IEEE supercomputing '88, Orlando, FL (USA), 14-18 Nov 1988).

A performance evaluation and comparison of the new Hitachi S-820/80 supercomputer on a set of standard Fortran benchmark codes which range from simple kernels to fluid dynamics applications.

44388 Performance comparison of the CRAY-2 and CRAY X-MP/416 supercomputers. Simmons, M.L. (Computing and Communications Div., Group C-3, MS B265, P.O. Box 1663, Los Alamos National Lab., Los Alamos, NM (US)); Wasserman, H.J. pp. 460 of Proceedings of IEEE supercomputing '88. IEEE Service Center, Piscataway, NJ (1988). (CONF-881112–: IEEE supercomputing '88, Orlando, FL (USA), 14-18 Nov 1988).

The serial and parallel performance of one of the world's fastest general purpose computers, the CRAY-2, is analyzed using the standard Los Alamos Benchmark Set plus codes adopted for parallel processing. For comparison, architectural and performance data are also given for the CRAY X-MP/416. Factors affecting performance, such as memory bandwidth, size and access speed of memory, and software exploitation of hardware, are examined. The parallel processing environments of both machines are evaluated, and speed-up measurements for the parallel codes are given.

44389 Expert systems application for diagnosis and troubleshooting of computer systems and instrumentation. Carr, K.R. (Oak Ridge National Lab., Oak Ridge, TN (US)). vp. of Proceedings of the ISA/86 international conference and exhibit. Instrument Society of America, Research Triangle Park, NC (1986). (CONF-861039–: Instrument Society of America international conference and exhibit, 13-16 Oct 1986).

In some instances, a computer program that simulates human decision making in a specified area of knowledge, called an expert system, can be an appropriate and powerful tool to facilitate diagnosis and troubleshooting of computer systems and instrumentation. However, a determination of the advisability and usefulness of implementing an expert system for a particular application requires careful consideration and several factors. A project in progress of the U.S.. Navy to evaluate potential expert systems applications for hot-line troubleshooting support of geographically dispersed computer systems is described here. Even though conducted with an emphasis on specific types of equipment, the project developed methods and information generally applicable in the decision to implement an expert system as a troubleshooting aid for any type of computer or instrumentation equipment.

44390 A visualization model based on the mathematics of fiber bundles. Butler, D. M. (Limit Point Systems, 39120 Argonaut Way, Suite 397, Fremont, California 94538 (US)); Pendley, M. H. *Computers in Physics (USA),* 3(5): 45-51 (Sep 1989). DOE Contract AC04-76DP00789.

In this paper, a visualization model based on the mathematics of fiber bundles is described. A brief, intuitive description of the mathematics of fiber bundles is given, introducing the concepts using typical application examples and emphasizing aspects relevant to our visualization model. Three important classes of operations on fiber bundles are described. A flexible scheme is developed for constructing graphic representations of fiber bundles and a simple but useful visualization taxonomy.

44391 The visualization management system approach to visualization in scientific computing. Butler, D. M. (Limit Point Systems, 39120 Argonaut Way, Suite 397, Fremont, California 94538 (US)); Pendley, M. H. *Computers in Physics (USA),* 3(5): 40-44 (Sep 1989). DOE Contract AC04-76DP00789.

This paper introduces the visualization management system (ViMS), a new approach to the development of software for visualization in scientific computing (ViSC). The conceptual foundation for a ViMS is an abstract visualization model that specifies a class of geometric objects, the graphic representations of the objects, and the operations on both. A ViMS implements a visualization model and provides four levels of mechanisms for developing applications. The ViMS requirements and a model-independent ViMS architecture are described. The ViMS approach presents several important opportunities for visualization standards.

44392 Higher order Godunov methods for general systems of hyperbolic conservation laws. Bell, J. B. (Lawrence Livermore National Laboratory, P.O. Box 808, Livermore, California 94550 (US)); Colella, P.; Trangenstein, J. A. *Journal of Computational Physics (USA),* 82(2): 362-397 (Jun 1989). DOE Contract W-7405-ENG-48.

We describe an extension of higher order Godunov methods to general systems of hyperbolic conservation laws. This extension allow the method to be applied to problems that are not strictly hyperbolic and exhibit local linear degeneracies in the wave fields. The method constructs an approximation of the Riemann problem from local wave information. A generalization of the Engquist–Osher flux for systems is then used to compute a numerical flux based on this approximation. This numerical flux replaces the Godunov numerical flux in the algorithm, thereby eliminating the need for a global Riemann problem solution. The additional modifications to the Godunov methodology that are needed to treat loss of strict hyperbolicity are described in detail. THe method is applied to some simple model problems for which the glocal analytic structure is known. The method is also applied to the black-oil model for multiphase flow in petroleum reservoirs. © 1989 Academic Press, Inc.

44393 Product representation for the harmonic series of a unit vector: A string application. Brown, R. W. (Physics Department, Case Western Reserve University, Cleveland, Ohio 44106 (US)); DeLaney, D. B. *Physical Review Letters (USA),* 63(5): 474-477 (31 Jul 1989).

We find a representation for the finite Fourier series of a vector whereby any constant constraint on its magnitude is completely solved and automatically satisfied. The representation is a product of rotations, one set for each harmonic, such that the independent degrees of freedom are identified as rotational angles and an infinite series is replaced by an infinite product. This can be applied to the study of relativistic strings, and other applications and generalizations are anticipated.

44394 Consistent finite difference operators that satisfy $\nabla \cdot \nabla \times \equiv 0$. Caramana, E. J. (Los Alamos National Laboratory, Los Alamos, New Mexico 87545 (US)). *Journal of Computational Physics (USA),* 82(2): 492-498 (Jun 1989).

Faraday's law of electromagnetism is solved in cylindrical coordinates. (AIP)

44395 The second-order sharpening of blurred smooth borders. Swartz, B. (Theoretical Division, MS B284 University of California Los Alamos National Laboratory Los Alamos, New Mexico 87545(US)). *Mathematics of Computation (USA),* 52(186): 675-714 (Apr 1989). DOE Contract W-7405-ENG-36.

The problem is to approximate, with local second-order accuracy, the smooth boundary separating a black and a white region in the plane, given discretely located gray values associated with a blurring of that border. "Second-order", here, is with respect to the size *h* of the scale of the prescribed blurring. The locally determined approximations are line segments. The algorithms discussed here can result in second-order accuracy, but they may not in certain geometric circumstances. Typical local curvature estimates based on adjacent line segments do not converge, but atypical one does. Consideration of a class of scaled blurrings leads to a type of blurring of borders which is particularly easy for a computer to undo locally, yielding a line which is locally second-order accurate. Some extensions to three (and more) dimensions are appended.

44396 Oblique derivative boundary conditions and the image method for wedges. Gautesen, A.K. (0305000). *SIAM Journal on Applied Mathematics (USA),* 48(6): 1487-1492 (Dec 1988).

The image method of solving boundary value problems in half spaces with oblique derivative boundary conditions for a class of equations including the wave equation, the heat equation and Laplace's equation is extended to spaces whose boundaries are formed by two intersecting planes with angle of intersection π/N.

44397 (INDC(SEC)–097/UN) INDC list of correspondents for the exchange of nuclear data information and compilation of national nuclear data committees. International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. May 1989. 125p. Order Number DE89635660/JAW. Available from NTIS (US Sales Only), PC A06/MF A01 - OSTI; INIS.

This list supersedes INDC(SEC)-93/UN.

The document includes information on currently existing National Nuclear Data Committees and their memberships. It contains five sections. The first section contains a detailed description of the INDC distribution categories, distribution codes and document designator codes. The second section describes the aims, organization and objectives of individual national nuclear data committees. The third section lists names and addresses in alphabetical order within each state or international organization together with the assigned INDC document distribution code(s). This is followed by four shorter lists, indicating the names of individuals in each distribution category, sorted by country or international organization, and the total number of individuals in each category. The final section provides the names of nuclear data committee members also listed by country or international organization.

44398 (INDC(SEC)–098/UN) **List of documents received by the INDC Secretariat.** International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee. May 1989. 30p. Order Number DE89635668/JAW. Available from NTIS (US Sales Only), PC A03/MF A01 - OSTI; INIS.

This list supersedes INDC(SEC)-094/UN.

The Nuclear Data Section of the IAEA receives documents originated by or for the International Nuclear Data Committee for distribution. This list includes all INDC documents received and distributed by the INDC Secretariat during the period September 1987 to February 1989. The list is produced directly from computer printouts into two groups: one ordered by accession number, and the other ordered by document number within each series. The document lists also in an Appendix the titles of reports received as single copies for information.

44399 (INIS-mf–11503, pp. 110-114) **Quality evaluation criteria for information extraction.** Ingman, D. (Technion-Israel Inst. of Tech., Haifa (Israel). Dept. of Nuclear Engineering); Merlis, Y. Israel Nuclear Society, Yavne (Israel). Mar 1989. (CONF-8903152–: Nuclear Societies of Israel annual meeting, Beer-Sheva (Israel), 13 Mar 1989). In *Annual Meeting 1989.* Order Number DE89012204/JAW. Available from NTIS (US Sales Only), PC A07/MF A01 - OSTI; INIS.

Transactions.; V. 15.

Analysis and processing of the measured data have many applications in many different fields. Some of the applications in nuclear engineering demand very high confidence level and therefore there is a need of reliable tools for data analysis. In this paper we introduce three data quality evaluation criteria: a. Parametric uncertainty, b. 'Reconstruction noise' autocorrelation, c. Moment analysis. The criteria of information examination can be used as powerful tools of analysis of the measured and processed data.

44400 (JAERI-M–89-015) **Experimental database retrieval system 'DARTS'. Handling manual.** Aoyagi, Tetsuo; Tani, Keiji; Haginoya, Hirobumi; Naito, Shinjiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1989. 96p. (In Japanese). Order Number DE89906473/JAW. Available from NTIS (US Sales Only), PC A05/MF A01.

In JT-60, a large tokamak device of Japan Atomic Energy Research Institute (JAERI), a plasma is fired for 5 ~ 10 seconds at intervals of about 10 minutes. The each firing is called a shot. Plasma diagnostic data are edited as JT-60 experimental database at every shot cycle and are stored in a large-scale computer (FACOM-M780). Experimentalists look up the data for specific shots which they want to analyze and consider. As the total number of shots increases, they find a difficulty in the looking-up work. In order that they can easily access to their objective shot data or shot group data by using a computer terminal, 'DARTS' (DAtabase ReTrieval System) has been developed. This report may provide enough information on DARTS handling for users. (author).

44401 (PNL–6928) **Testing Systems Database administrator guide.** Corrigan, A.L.; Olander, M. Pacific Northwest Lab., Richland, WA (USA). May 1989. 56p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC06-76RL01830. (TD–2699). Order Number DE89016241/JAW. Available from NTIS, PC A04/MF A01 - OSTI; GPO Dep.

The Pacific Northwest Laboratory (PNL) was contracted by the Navy Personnel Research and Development Center (NPRDC) to provide software for enhancing the NPRDC CAMP Facility. The objectives of this Database Administrator Guide are to provide the Database Administrator with guidelines for the following tasks: installing the databases software, creating the TSD databases, managing database user accounts and access levels, compiling PRO*C and PRO*FORTRAN source code, creating new CRT definitions and maintaining the TSD database.

44402 (PNL–6929) **Testing systems database Program Maintenance Manual for PNL-developed software systems.** Caplinger, J.T.; Olander, M. Pacific Northwest Lab., Richland, WA (USA). May 1989. 592p. Sponsored by DOD;DOE/DP. DOE Contract AC06-76RL01830. (TD–2699). Order Number DE89016247/JAW. Available from NTIS, PC A25/MF A01 - OSTI; GPO Dep.

The Pacific Northwest Laboratory (PNL) has developed software for enhancing the Navy Personnel Research and Development Center (NPRDC) CAMP Facility. This software was developed for NPRDC under Contract AC06-76RLO1830. The objective of this Program Maintenance Manual is to provide the maintenance programmer personnel with the information necessary to effectively maintain the software system.

44403 (SAND–89-1869C) **A new bound for the authentication channel when used in the notary mode.** Simmons, G.J. Sandia National Labs., Albuquerque, NM (USA). 1989. 21p. Sponsored by U.S. DOE Defense Programs. DOE Contract AC04-76DP00789. (CONF-8908103–1: 4. joint Swedish/Soviet international workshop on information theory, Gutland (Sweden), 27 Aug - 1 sep 1989). Order Number DE89015848/JAW. Available from NTIS, PC A03/MF A01 - OSTI; GPO Dep.

Authentication codes have traditionally been designed to only protect the receiver from accepting as authentic either fraudulent messages sent by an opponent when no legitimate message has been sent or else a fraudulent message substituted for the first legitimate message sent by an authorized transmitter. Clearly, an opponent might choose instead to wait and observe several legitimate (authenticated) messages before attempting to deceive the receiver. In this paper, we treat a "worst case" scenario in which the opponent can not only observe several authenticated messages before attempting a deception but he can also choose the information that is to be authenticated in the communications that occur before he acts. 15 refs.

44404 (AD-A–206885/6/XAB) **SDI (Strategic Defense Initiative) Battle Management/C3 (Command, Control, and Communications) networking technology program plan. Final report, January 1987-October 1988.** Botta, R.; Noll, S. Institute for Defense Analyses, Alexandria, VA (USA). Dec 1988. 163p. (IDA-M–305). Available from NTIS, PC A08/MF A01.

The Institute for Defense Analyses (IDA) has collected and analyzed information on network technology that is relevant to Battle Management Command, Control, and Communications (BM/C3). This memorandum report represents a program plan that will provide the SDIO BM C3 directorate with administrative and technical insight into network technology. This program plan focuses on C3 network concepts and provides information and analysis to the SDIO to be used in formulating budget requirements for FY 1988 and beyond. Based upon analysis of network requirements and ongoing programs, recommendations have been made for research areas that should be funded, including both the continuation of current work and the initiation of new tasks. While emphasis here is on the SDIO-funded tasks, other relevant government-sponsored and commercial efforts, such as packet radio networks, also have been examined.

44405 (AD-A–207169/4/XAB) **Some issues in emergency management. Public views in 1987. Final report, August-December 1987.** Nehnevajsa, J. Pittsburgh Univ., PA (USA). Univ. Center for Social and Urban Research. Dec 1987. 182p. Available from NTIS, PC A09/MF A01.

This report presents an overview of findings, derived from a 1987 national telephone survey, on current public sentiment as it relates to numerous crucial civil defense issues and concerns. A primary objective is to provide empirically based insight into some of the common arguments, presented as reflecting public attitudes and perceptions, that must be evaluated as decisions on complex national policy alternatives are weighed. Emergency planning and preparedness measures, in place or considered for future implementation, that address the threat of national disasters, technological hazards, and particularly those relevant to the threat of a nuclear confrontation are explored. The public's perception of what the principal goals of civil defense should be is questioned. Their acceptance of a nuclear attack as a credible threat is assessed, as well as their estimates of probable survival rates under a variety of passive defense conditions. The perceived viability and value of alternative civil-defense measures and the public's expectations regarding governmental responsibility for implementing such measures are explored. Willingness to finance such measures or to reallocate existing funds to civil defense efforts is reported as another indication of support. The acceptability of crisis relocation is evaluated through inquiries into the public's support for the development of a national relocation plan, their intentions to evacuate when threatened, either spontaneously or in compliance to a Presidential directive and their expectations of such a directive becoming a reality.

44406 (DOE/SF/16495–T2) **Stimulated rotational Raman scattering: Final report, September 1, 1986–March 31, 1989.** Parazzoli, C.G.; Rafanelli, G.L.; Capps, D.M.; Drutman, C. Hughes Aircraft Co., El Segundo, CA (USA). Electro-Optical and Data Systems Group. 31 Mar 1989. 230p. Sponsored by U.S. DOE Nuclear Energy. DOE Contract AC03-86SF16495. Order Number DE89016427/JAW. Available from NTIS, PC A11/MF A01 - OSTI; GPO Dep.

This document summarizes the work performed on DOE Contract Number AC03-86SF16495 by the Electro-Optics And Data Systems Group of Hughes Aircraft Company. The goal of this Stimulated Rotational Raman Scattering (SRRS) processes on high energy laser directed energy weapon systems. The program had three main objectives; achieving an accurate description of the physical processes involved in SRRS; developing a numerical algorithm to confidently evaluate SRRS-induced losses in the propagation of high energy laser beams in the uplink and downlink segments of the optical trains of various strategic defense system scenarios; and discovering possible methods to eliminate, or at least reduce, the deleterious effects of SRRS on the energy deposition on target. This document describes the accomplishments of the DOE program and is divided into the following sections: The first section discusses the motivation for the accomplishments of the DOE program; then discussed is the Semiclassical Theory Of Non-Resonant SRRS For Diatomic Homonuclear Molecules; and then the following appendices; Calculation of the Dipole Transition Reduced Matrix Element, Guided Tour of Hughes SRRS Code, Running the Hughes SRRS Code, and Hughes SRRS Code Listing.

Corporate Author Index

This index lists the corporate authors responsible for issuing the documents in this publication which are identified primarily by report number. The corporate names are entered in standardized forms as defined in *DOE Energy Data Base: Corporate Author Entries* (DOE/TIC-4585). Each entry under a corporate name includes the document title and citation number. Three items of information may appear in parentheses: (1) an abbreviation to identify the document type, such as a report; (2) the country of publication, also abbreviated; and (3) the language of the document if non-English (R;US;In French). Author affiliations are not listed in this index.

3 MW GROWIAN wind turbine test program. Final report, 14:41900 (R;DE;In German)
Amorphous silicon solar cells. Phase III. Final report, 14:41846 (R;DE;In German)
Boundary conditions for the existence of a heat trap in non-residential buildings and possible solutions, 14:42305 (R;DE;In German)
Building and test of a combined wind energy converter/heat pump plant for heat supply for the recreational area Spadener See, 14:42306 (R;DE;In German)
Comparison of different wind classifiers, 14:41892 (R;DE;In German)
Development of a coke-free cupola furnace. Energy conserving shaft furnace for iron materials. Final report, 14:42352 (R;DE;In German)
Development of new process technologies for solar cells with high efficiency manufactured from unconventionally purified silicon. Final report, 14:41845 (R;DE;In German)
Effective energy use in the energy industry and general industry - main emphasis in research sponsorship including energy storage systems, 14:42260 (R;DE;In German)
Electric properties of amorphous silicon (a-Si:H) and amorphous alloys (a-$Si_{1-x}C_x$:H, a-$Si_{1-x}Ge_x$:H). Final report, 14:41844 (R;DE;In German)
Emissions and dispersal measurements at the flue gas-/cooling air discharge system of the prototype power plant Voelklingen. Final report, 14:41925 (R;DE;In German)
Fibrous insulating materials in industrial furnaces - simulated calculations. Final report, 14:43031 (R;DE;In German)
Investigation of the combustion process of alternative fuels. Final report, 14:42420 (R;DE;In German)
Measurements at the wind energy converter Ruhrtal R 1550. Final report, 14:41899 (R;DE;In German)

Operational tests of the first purely coal based combined cycle power plant - prototype power plant Voelklingen. Final report, 14:41912 (R;DE;In German)
Operational tests of the innovative components in the prototype power plant Voelklingen - fluidized-bed combustion and hot air gas turbine - and research of their reciprocal influences. Final report, 14:41911 (R;DE;In German)
Preparation of basic project design documents for advanced geothermal power plants. Final report, 14:41889 (R;DE;In German)
Quality monitoring of LAW/MAW waste forms. Final report, 14:41735 (R;DE;In German)
Significance of the SNR 300 fast breeder reactor in terms of research policy. Documentation, 14:42016 (R;DE;In German)
Studies on the influence of foreign ions on the calcium carbonate precipitation under conditions of water heating. Final report, 14:43489 (R;DE;In German)
Technology for the production of large area solar generators. Pt. 2. Final report, 14:41848 (R;DE;In German)
The construction of the large 3 MW wind turbine system, the GROWIAN. Final report, 14:41901 (R;DE;In German)
The operation of the large 3 MW wind turbine system, the GROWIAN. Final report, 14:41898 (R;DE;In German)
Use of thorium fuel in light water reactors, studies performed by KWU, phase 2 A. Final report, 14:41971 (R;DE;In German)

Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany, F.R.)
Description of the MOD2/85 versions of the RALOC/FIPLOC family. Pt. 1. Code system including appendices A and B, 14:42083 (R;DE)
Evaluation of data recordings of documentation systems in nuclear power plants (SABA). Final report, 14:42082 (R;DE;In German)

1989 symposium on stationary combustion nitrogen oxide control: Volume 2, 14:41923 (R;US)
Advanced Utility Simulation Model (AUSM), version 3.0. Model-Simulation, 14:42284 (R;US)
Area sources of VOC (volatile organic compounds) emissions and their contribution to tropospheric ozone concentrations. Report for July 1988-March 1989, 14:43369 (R;US)
Technological progress in reducing CFC (chlorofluorocarbon) and halon emissions, 14:43368 (R;US)

Environmental Protection Agency, Research Triangle Park, NC (USA). Air Risk Information Support Center
Glossary of terms related to health, exposure, and risk assessment, 14:43382 (R;US)

Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Research and Exposure Assessment Lab.
Atmospheric processes and effects on materials. Interim report May 88-Dec 88, 14:43362 (R;US)
User's guide to the Complex-Terrain Dispersion Model Plus Algorithms for Unstable Situations (CTDMPLUS): Volume 1. Model description and user instructions, 14:43372 (R;US)

Environmental Protection Agency, Research Triangle Park, NC (USA). Atmospheric Sciences Research Lab.
Sampling of reactive atmospheric species by transition-flow reactor: application to nitrogen species (journal version), 14:43370 (R;US)

Environmental Protection Agency, Research Triangle Park, NC (USA). Environmental Criteria and Assessment Office
Supplement to the 1986 EPA (Environmental Protection Agency) air-quality criteria for lead - Volume 1, addendum (pages A1-A67). Draft report, 14:43371 (R;US)

Environmental Protection Agency, Research Triangle Park, NC (USA). Office of Air Quality Planning and Standards
National air-pollutant emission estimates, 1940-1987. Final report, 14:43383 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Emergency and Remedial Response
Guidance for conducting remedial investigations and feasibility studies under CERCLA. Interim report (Final), 14:42364 (R;US)
Superfund Record of Decision (EPA Region 7): Times Beach, St. Louis County, Missouri. Minker/Stout/Romaine Creek, Jefferson County, Missouri (third remedial action), September 1988. Final report, 14:43460 (R;US)
Superfund Record of Decision (EPA Region 2): Brewster Well Field, Village of Brewster, Putnam County, New York (second remedial action), September 1988. Final report, 14:43532 (R;US)
Superfund Record of Decision (EPA Region 5): Environmental Conservation and Chemical Corporation, and Northside Sanitary Landfill, Zionsville, Indiana (first remedial action), September 1987. Final report, 14:43533 (R;US)
Superfund Record of Decision (EPA Region 7): John Deere DDubuque Works, Dubuque, Iowa (first remedial action), September 1988. Final report, 14:43461 (R;US)
Superfund Record of Decision (EPA Region 7): Midwest Manufacturing/North Farm Superfund Site. North Farm operable unit, Kellogg, Iowa, (first remedial action), September 1988, 14:43536 (R;US)
Superfund Record of Decision (EPA Region 8): Broderick Wood Products Company, Adams County, Colorado, (first remedial action), June 1988, 14:42367 (R;US)
Superfund Record of Decision (EPA Region 2): Mid-State Disposal Landfill, Marathon Battery, Cold Spring, New York, (second remedial action), September 1988, 14:43537 (R;US)
Superfund Record of Decision (EPA Region 6): Koppers Texarkana Site, Texarkana, Texas (first remedial action), September 1988, 14:43462 (R;US)
Superfund Record of Decision (EPA Region 3): West Virginia Ordnance Works, Mason County, West Virginia, (second remedial action), September 1988. Final report, 14:43538 (R;US)
Superfund Record of Decision (EPA Region 2): Beachwood/Berkeley Wells, Ocean County, New Jersey (first remedial action), June 1988. Final report, 14:43539 (R;US)
Superfund Record of Decision (EPA Region 2): Kin-Buc Landfill, Operable Unit I, Edison Township, Middlesex County, New Jersey (first remedial action), September 1988, 14:42392 (R;US)
Superfund Record of Decision (EPA Region 2): GE Wiring Devices, Juana Diaz, Puerto Rico (first remedial action), September 1988. Final report, 14:43540 (R;US)
Superfund Record of Decision (EPA Region 5): IMC East Plant, Terre Haute, Indiana site (IMC) (second remedial action), June 1988. Final report, 14:43463 (R;US)
Superfund Record of Decision (EPA Region 5): Mid-State Disposal Landfill, Marathon County, Wisconsin (first remedial action), September 1988. Final report, 14:42368 (R;US)
Superfund Record of Decision (EPA Region 9): Lorentz Barrel and Drum, San Jose, California (first remedial action), September 1988, 14:43503 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Environmental Engineering and Technology
Guide to treatment technologies for hazardous wastes at Superfund sites, 14:43464 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Health and Environmental Assessment
Evaluation of the potential carcinogenicity of lead and lead compounds: in support of reportable quantity adjustments pursuant to CERCLA (Comprehensive Environmental Response, Compensation, and Liability Act) section 102. Draft report, 14:43641 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Municipal Pollution Control
Report to Congress: Indian waste-water treatment needs and assistance, 14:43535 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Pesticides and Toxic Substances
Preliminary evaluation of initial TSCA (Toxic Substances Control Act) section 8(e) substantial risk notices. January 1, 1987 to December 31, 1988, 14:42232 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Solid Waste
1985 national biennial report of hazardous-waste generators and treatment, storage, and disposal facilities regulated under RCRA (Resource Conservation and Recovery Act). Volume 1: summary, 14:42365 (R;US)
1985 national report of hazardous-waste generators and treatment, storage and disposal facilities regulated under RCRA: (Resource Conservation and Recovery Act). Volume 2: methodology and data, 14:42366 (R;US)
Report to Congress: management of hazardous wastes from educational institutions, 14:42391 (R;US)
Solid-waste dilemma: an agenda for action. Final report, 14:42235 (R;US)

Environmental Protection Agency, Washington, DC (USA). Office of Toxic Substances
Toxic Release Inventory (TRI), 1987. Data file, 14:42233 (R;US)

Algorithm for numerical calculation of thermal-hydraulic parameter distribution in a fuel assembly based on by-channel calculational technique for unsteady operational conditions, 14:42047 (R;SU;In Russian)
Azimuthal non-uniformity of velocity field in a nuclear reactor sinking slit, 14:42044 (R;SU;In Russian)
Conjugation of solenoids of radiation transport equation in the problems of radiation protection calculation. Method and algorithms, 14:44006 (R;SU;In Russian)
Conjugation of solutions of radiation transport equation in the problems of radiation protection calculation. Calculation of heterogeneous shields, 14:42014 (R;SU;In Russian)
Interchannel transfer and temperature fields in a model fuel assembly of a fast reactor for cross section blockage, 14:42048 (R;SU;In Russian)
One-dimensional model of impurity deposition in steam generating tubes, 14:42043 (R;SU;In Russian)
Program mock-up of a system for NPP prompt monitoring, 14:42051 (R;SU;In Russian)
Semi-empirical theory of heat-transfer when boiling, 14:42956 (R;SU;In Russian)

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (USSR). Inst. Fiziki Vysokikh Ehnergij
Fast recording and triggering electronics for experiments at IHEP, 14:43168 (R;SU;In Russian)
Minimal software package for operations with the CAMAC/SUMMA modules using the AKK-196 microcomputer, 14:43100 (R;SU;In Russian)
On-line system to measure magnetic characteristics of steel samples, 14:43101 (R;SU;In Russian)

Gouvernement du Quebec, PQ (Canada). Direction Generale de l'Energie
Energy. Energy balance of Quebec (1958-1974), 14:42287 (R;CA;In French)

Graham (Reuben L.), Inc., Charleston, WV (USA)
Exploration-production studies in newly drilled Devonian shale gas wells. Annual report, February-1988-January 1989, 14:41592 (R;US)

Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France)
β-delayed neutron emission of the isotopes ^{20}C, ^{40}P, ^{41}P, ^{42}P and ^{43}S, ^{44}S, 14:43916 (R;FR)
Properties of light nuclei far from stability, 14:43888 (R;FR)

Grenoble-1 Univ., 38 (France). Inst. des Sciences Nucleaires
Alignment of protons and $h_{11}2/$ neutrons and configurations of two quasi-particles in the Ba124 nucleus, 14:43901 (R;FR;In French)
Realization of an apparatus for the synthesis and detection of carbon 11 labelled fatty acids and of a data acquisition system for the study of the myocardial methabolism of radiopharmaceuticals, 14:43209 (R;FR;In French)

Grenoble-1 Univ., 74 - Annecy (France). Lab. de Physique des Particules
Superconducting radiofrequency e^+e^- linear collider for bottom quark and nuclear physics studies, 14:43049 (R;FR)

Groningen Rijksuniversiteit (Netherlands). Subfaculteit Wiskunde en Informatica
Towards a parallel algorithm for the many-body problem, 14:44375 (R;NL)

Grosse Windenergieanlage Bau- und Betriebsgesellschaft m.b.H. (GROWIAN), Hamburg (Germany, F.R.)
3 MW GROWIAN wind turbine test program. Final report, 14:41900 (R;DE;In German)
The construction of the large 3 MW wind turbine system, the GROWIAN. Final report, 14:41901 (R;DE;In German)
The operation of the large 3 MW wind turbine system, the GROWIAN. Final report, 14:41898 (R;DE;In German)

Guelph Univ., ON (Canada)
A critical review of the light scattering technique in the determination of oil/water interfacial tension, 14:41534 (R;CA)
Implications of climatic change for agriculture in Ontario. A summary of Land Evaluation Group reports, 14:43542 (R;CA;In English and French)

H

Hanford Engineering Development Lab., Richland, WA (USA)
Microstructural examination of 12% Cr martensitic stainless steel after irradiation at elevated temperatures in FFTF [Fast Flux Test Facility], 14:42452 (R;US)

Hart (Fred C.) Associates, Inc., New York, NY (USA)
Installation-restoration program. Phase 2. Confirmation/quantification. Stage 1 for Minot Air Force Base, Minot, North Dakota. Volume 3. Appendices G through M, 14:42220 (R;US)

Harvard Univ., Cambridge, MA (USA). Div. of Applied Sciences
Crack-growth resistance in transformation-toughened ceramics, 14:42493 (R;US)

Haystack Observatory, Westford, MA (USA)
Multi-instrument studies of the auroral ionosphere. Final report, 1 November 1985-31 October 1988, 14:43745 (R;US)

Hoogovens Groep BV, Ijmuiden (Netherlands)
The development and implementation of a system to adjust automatically, by computer, the heat-input to a coke oven battery, 14:41434 (R;XE)

Houston Univ., TX (USA). Dept. of Geology
Yukon Delta coastal processes study. Final report, 14:41508 (R;US)

Howard Univ., Washington, DC (USA). Dept. of Chemistry
Volatiles trapped in coals: September 15, 1986–September 14, 1989, 14:41449 (R;US)

Hughes Aircraft Co., El Segundo, CA (USA). Electro-Optical and Data Systems Group
Stimulated rotational Raman scattering: Final report, September 1, 1986–March 31, 1989, 14:44406 (R;US)

Hughes Research Labs., Malibu, CA (USA)
Cooperative phenomena for new coherent radiation sources. Final report, 14 May 1987-14 June 1988, 14:42931 (R;US)

I

IAP Research, Inc., Dayton, OH (USA)
Long pulse homopolar generator. Final report, April 1983-June 1987, 14:42901 (R;US)

ICF, Inc., Fairfax, VA (USA)
Community relations in Superfund: a handbook (interim version), 14:42231 (R;US)
Developing a state wellhead protection program: a user's guide to assist state agencies under the Safe Drinking Water Act, 14:43523 (R;US)

ICF-Lewin Energy, Fairfax, VA (USA)
Geologic assessment of natural gas from coal seams in the Central Appalachian Basin. Topical report, January-November 1988, 14:41605 (R;US)

Idaho National Engineering Lab., Idaho Falls, ID (USA)
Teaching corporate culture using interactive video training, 14:41749 (R;US)

Idaho State Univ., Pocatello, ID (USA)
Genetics of acidophilic, heterotrophic bacteria, 14:43576 (R;US)

IEC Beak Consultants Ltd., Mississauga, ON (Canada)
Assessment of the radiological impact of uranium mining in northern Saskatchewan, 14:41758 (R;CA)

Illinois Community Action Association, Springfield, IL (USA)
Illinois self-help consortium for water and waste-water projects. Final report, 14:43517 (R;US)

Illinois Dept. of Energy and Natural Resources, Springfield, IL (USA). Office of Solid Waste and Renewable Resources
Biomass energy industry sourcebook, 14:41849 (R;US)

Illinois Dept. of Energy and Natural Resources, Springfield, IL (USA). Strategic Planning Section
Illinois statewide electric utility plan. Volume 2. Analysis and recommendations, 14:42282 (R;US)
Illinois statewide electric utility plan. Volume 3. Appendix-methodology, 14:42283 (R;US)

Illinois Univ., Urbana, IL (USA). Center for Supercomputing Research and Development
Alkali-rare gas and metal halide molecules as potential visible lasers. Final report, 1 October 1979-30 September 1980, 14:42938 (R;US)

Illinois Univ., Urbana, IL (USA). Dept. of Chemistry
Nuclear magnetic resonance and laser-scattering techniques at high pressure, 14:44042 (R;US)

Illinois Univ., Urbana, IL (USA). Dept. of Electrical and Computer Engineering
Nonlinear optical techniques for thin-film growth and visible ultraviolet lasers. Final report, 30 September 1985-29 September 1988, 14:42579 (R;US)

Illinois Univ., Urbana, IL (USA). Dept. of Mechanical and Industrial Engineering
Spectroscopic diagnostics of electron temperature and energy-conversion efficiency of laser-sustained plasma in flowing argon. Report for 1 September 1987-8 August 1988, 14:43796 (R;US)

Illinois Univ., Urbana, IL (USA). Environmental Research Labs.
Light-sensitized decontamination of ground-water hazardous chemicals. Technical report (Final), 14:43496 (R;US)

Imatran Voima Oy, Helsinki (Finland)
Discussion on politics of energy and environment in Finland in 1974, '79 and '86. Bases for analysis of the discussion, preliminry analysis of empirical material and working-hypotheses, 14:42223 (R;FI;In Finnish)

In-Situ, Inc., Laramie, WY (USA)
Application of hydrology to evaluation of coalbed methane reservoirs. Topical report, January 1987-December 1988, 14:41606 (R;US)

Indiana Univ., Bloomington, IN (USA). Dept. of Chemistry
Flow-injection analysis utilizing a spectrally segmented photodiode-array inductively coupled plasma-emission spectrometer. I. Microcolumn preconcentration for the determination of molybdenum. Technical report, 14:42626 (R;US)
Use of a spectrally segmented photodiode-array spectrometer for inductively coupled plasma atomic-emission spectroscopy. Technical report, 14:43256 (R;US)

Institut de Recherche d'Hydro-Quebec, Varennes, PQ (Canada)
Electrical-resistance element arrays operating at high voltage for heating and drying in industrial applications, 14:42354 (R;CA)
Mechanical rating scheme for polymer distribution post insulators, 14:41937 (R;CA)
Performance evaluation of optical fibre HV [high voltage] controls links, 14:41938 (R;CA)
Symposium. Energy storage, 14:42173 (R;CA;In French)
The Varennes tokamak., 14:44188 (R;CA)
Voltage unbalance on distribution systems. Phase 1, 14:41939 (R;CA)

Institut fuer Laermarme Konstruktion, Mettmann (Germany, F.R.)
Present and future development in noise control of heat pumps, 14:42322 (R;DE;In German)

Institut National de Physique Nucleaire et de Physique des Particules, 75 - Paris (France)
Strings and superstrings. Electron linear colliders, 14:43861 (R;FR;In French)

Institut Wohnen und Umwelt G.m.b.H., Darmstadt (Germany, F.R.)
2nd meeting of the energy consulting working committee, November 17, 1986: Thermal insulation - advanced systems made to meet present and future requirements. Proceedings, 14:42307 (R;DE;In German)
First meeting of the energy consulting working committee, August 11, 1986. Proceedings, 14:42261 (R;DE;In German)
Primary energy and air pollution balances of insulating materials, 14:42588 (R;DE;In German)

Institute for Defense Analyses, Alexandria, VA (USA)
IDA (Institute for Defense Analyses) gamma-ray laser annual summary report (1986). Investigation of the feasibility of developing a laser using nuclear transitions. Final report, 1 October 1985-30 September 1986, 14:43937 (R;US)
IDA (Institute for Defense Analyses) gamma-ray laser annual summary report (1987). Investigation of the feasibility of developing a laser using nuclear transitions. Final report, October 1986-September 1987, 14:43938 (R;US)
Report on the possible benefits of using high-temperature superconductor materials in particle-accelerator design. Final report, June-September 1987, 14:42905 (R;US)
SDI (Strategic Defense Initiative) Battle Management/C3 (Command, Control, and Communications) networking technology

program plan. Final report, January 1987-October 1988, 14:44404 (R;US)

Institute of Gas Technology, Chicago, IL (USA)
Contaminant resistant molten carbonate fuel cell: Final report, June 1986–September 1988, 14:42293 (R;US)
Development of a hot gas cleanup system: Final report, 14:41422 (R;US)
Sulfur-tolerant anode materials: Final report, 14:42294 (R;US)

Institute of Occupational Medicine, Edinburgh (UK)
Epidemiological and clinical studies of back pain in the mining industry. Final report, 14:41500 (R;GB)
Working in hot conditions in mining: a literature review. Final report, 14:41501 (R;GB)

International Atomic Energy Agency, Seibersdorf (Austria). Laboratories
Total evaporation measurements of plutonium with a Thermal Quadrupole Mass Spectrometer (THQ), 14:42629 (R;XA)

International Atomic Energy Agency, Vienna (Austria)
Atlas of liver imaging. A compendium of liver images used in a coordinated research programme on evaluation of nuclear medicine imaging procedures for the diagnosis of liver diseases, 14:43562 (R;XA)
Nuclear data for the calculation of thermal reactor reactivity coefficients. Proceedings of an advisory group meeting held in Vienna, 7-10 December 1987, 14:41955 (R;XA)
Radioisotope tracer applications in industry, 14:41789 (R;MY)
Robotics and remote maintenance concepts for fusion machines. Proceedings of a technical committee meeting held in Karlsruhe, 22-24 February 1988, 14:44263 (R;XA)

International Atomic Energy Agency, Vienna (Austria). International Nuclear Data Committee
INDC list of correspondents for the exchange of nuclear data information and compilation of national nuclear data committees, 14:44397 (R;XA)
List of documents received by the INDC Secretariat, 14:44398 (R;XA)

International Bank for Reconstruction and Development, Washington, DC (USA)
Household energy handbook: an interim guide and reference manual. World Bank technical paper, 14:42264 (R;US;In French)

International Energy Agency, 75 - Paris (France)
Task 8, Passive and hybrid solar low energy buildings: Subtask A, Performance evaluation procedures, 14:41869 (R;FR)

International Energy Agency, 75 - Paris (France). Programme to Develop and Test Solar Heating and Cooling Systems
Validation of models for estimating solar radiation on horizontal surfaces: Final report: Task IX, 14:41870 (R;FR)

International Solar Electric Technology, Inglewood, CA (USA)
Low-cost technique for producing $Cd_{1-x}Zn_xTe$ devices for cascade cell application: Final subcontract report, 1 June 1987–15 December 1988, 14:41852 (R;US)

Intertask Ltd., Ottawa, ON (Canada)
Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Proceedings, 14:42179 (R;CA;In English and French)
Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Abstracts, 14:42180 (R;CA;In English and French)
Enerstock 85. 3rd International conference on energy storage for building heating and cooling. Closing session, 14:42308 (R;CA)

Iowa State Univ. of Science and Technology, Ames, IA (USA). Dept. of Aerospace Engineering
Three-dimensional high-speed boundary-layer flows. Final report, September 1985-May 1988, 14:42952 (R;US)

Iowa State Univ. of Science and Technology, Ames, IA (USA). Dept. of Nuclear Engineering
Unconventional liquid metal cooled fast reactors: Final report, September 1, 1985–May 31, 1989, 14:42004 (R;US)

Iowa Univ., Iowa City, IA (USA). Dept. of Chemistry
Synthesis of novel fluorinated phosphonic and phosphinic acid electrolytes for phosphoric acid fuel cells. Final report, May 1985-December 1988, 14:42295 (R;US)

Iowa Univ., Iowa City, IA (USA). Dept. of Physics and Astronomy
Particle simulations of magnetospheric plasmas. Final report, 1 November 1987-31 October 1988, 14:43743 (R;US)

Israel Atomic Energy Commission, Beersheba (Israel). Nuclear Research Center-Negev
Movement of tritium in ecological systems, 14:43448 (R;IL;In Hebrew)

Israel Nuclear Society, Yavne (Israel)
Annual Meeting 1989, 14:43872 (R;IL)

Istituto Nazionale di Fisica Nucleare, Rome (Italy)
New VDM prediction for time like form factors, 14:43819 (R;IT)

Isuzu Motors Ltd., Southfield, MI (USA)
NUSAR: N reactor updated safety analysis report–Amendment 19, 14:42132 (R;US)

J

Jacobs Engineering Group, Inc., St. Charles, MO (USA)
Chemical soil investigation report for the Weldon Spring Chemical Plant/Raffinate Pits, Phase II, 14:41762 (R;US)

Japan Atomic Energy Research Inst., Tokyo (Japan)
BWR LOCA simulation test (RUN 992) in ROSA-III program for a 10% main steam line break with ECCS double failures, 14:41961 (R;JP)
Characteristics of edge localized mode in JFT-2M H-mode, 14:44210 (R;JP)
Core dynamics analysis code for high temperature gas reactor, 'BLOOST-J2', 14:41985 (R;JP;In Japanese)
Experimental database retrieval system 'DARTS'. Handling manual, 14:44400 (R;JP;In Japanese)
High-temperature chlorination reactions and detection of defective particles for thorium oxide based coated particle fuels, 14:41986 (R;JP;In Japanese)
JMTR-operation and technical development no. 2. Fiscal 1985, 14:42072 (R;JP;In Japanese)
LOSP-initiated event tree analysis for BWR, 14:42095 (R;JP;In Japanese)
Observation of H-mode by edge heating solely by electron cyclotron heating in a divertor configuration of JFT-2M tokamak, 14:44288 (R;JP)
RADHEAT-V4: a code system to generate multigroup constants and analyze radiation transport for shielding safety evaluation, 14:44010 (R;JP)
Review of JT-60 experimental results from June to October, 1988, 14:44211 (R;JP)
Study on intelligent nuclear systems, (HASP: human acts simulation program). Progress report 1988, 14:42909 (R;JP;In Japanese)
Summary of the CRAC experimental conditions and data, 14:42910 (R;JP;In Japanese)
Takasaki ion beam implanter (TIBI). Operation and experiments, 14:43048 (R;JP;In Japanese)
Thermal-hydraulic characteristics of double flat core HCLWR, 14:41960 (R;JP)

Jet Propulsion Lab., Pasadena, CA (USA)
MPD (Magnetoplasma Dynamic) thruster erosion research. Final report, 1 January-31 December 1987, 14:43792 (R;US)

Joint Inst. for Lab. Astrophysics, Boulder, CO (USA)
Absolute cross sections for molecular photoabsorption, partial photoionization, and ionic photofragmentation process, 14:43777 (R;US)

Joint Inst. for Nuclear Research, Dubna (USSR)

Uses of ammonia water in catalytic DeNOx-plants. Investigation results from a pilot plant, 14:41926 (R;DE;In German)

Laval Univ., Quebec City, PQ (Canada). Dept. de Genie Chimique
Preparation of new catalysts based on ZSM5-supported metals for deoxygenation. Final report, 1984-1986, 14:41803 (R;CA;In French)

Lawrence Berkeley Lab., CA (USA)
184-Inch Synchrocyclotron decommissioning, 14:43050 (R;US)
A symplectic coherent beam-beam model, 14:43075 (R;US)
AC magnetic measurements of the ALS Booster Dipole Engineering Model Magnet, 14:43114 (R;US)
Advanced Light Source (ALS) beam position monitor, 14:43116 (R;US)
Advanced light source storage ring rf system, 14:43141 (R;US)
Analytic theory of ICRF minority heating, 14:44217 (R;US)
Applications of a-Si:H radiation detectors, 14:43220 (R;US)
Computer-aided studies of the ALS 500 MHz storage ring cavity, 14:43140 (R;US)
Cryogenic mechanical properties of low density superplastic aluminum alloys, 14:42463 (R;US)
Decay studies of nuclei near the proton drip line: ^{35}Ca, ^{31}Ar, ^{69}Br, ^{65}As, 14:43902 (R;US)
Design of grazing incidence monochromators involving unconventional gratings, 14:43269 (R;US)
Design, fabrication, and calibration of curved integral coils for measuring transfer function, uniformity, and effective length of LBL ALS [Lawrence Berkeley Laboratory Advanced Light Source] Booster Dipole Magnets, 14:43115 (R;US)
Emittance at the superHILAC and the Bevalac transfer line, 14:43074 (R;US)
Evaluating energy and non-energy impacts of energy conservation programs: A supply curve framework of analysis, 14:42217 (R;US)
Evidence for unconventional superconductivity in UPt_3: Splitting of the specific heat anomaly at Tsub c, 14:42510 (R;US)
In-situ density and temperature measurements of vibrationally-excited hydrogen molecules in ion source plasmas, 14:43775 (R;US)
Insertion devices for the Advanced Light Source at LBL, 14:43117 (R;US)
Lattice and electronic specific heat of $YBa_2Cu_3O_7$, 14:42512 (R;US)
Magnet power supplies for the Advanced Light Source, 14:43118 (R;US)
Measurement of the η parameter in μ^+ decay, 14:43809 (R;US)
Nonuniformities in organic liquid ionization calorimeters, 14:43219 (R;US)
Pd and Ni thin-film reactions with InP: Possibilities for metal contacts, 14:42740 (R;US)
Program development fund: FY 1987, 14:42242 (R;US)
Reaction of oxygen with allene, 14:42739 (R;US)
Scattering of an ICRF magnetosonic wave by plasma density turbulence, 14:44218 (R;US)
Space-time aspects of hadronic cascading in lepton nucleus scattering, 14:43839 (R;US)
Specific heat of the high-T_c superconductor $(Bi_{1.66}Pb_{0.34})Ca_2Sr_2Cu_3O_{10}$, 14:44165 (R;US)
Specific heat of the high-T_c $YBa_2(Cu_{3-x}M_x)O_7$ with M = Cr or Zn, 14:42511 (R;US)
The electromagnetic penguin contribution to ϵ'/ϵ for large top quark mass, 14:43840 (R;US)
The interplay of nuclear and atomic physics in the synthesis of the elements, 14:43728 (R;US)
The performance of charcoal-based radon detection under time-varying radon conditions: Experimental and theoretical results, 14:42311 (R;US)
Thermodynamic tables for nuclear waste isolation: Vol. 1, Aqueous solutions database, 14:41733 (R;US)
Threshold photoelectron spectrum of the Argon 3s satellites, 14:43776 (R;US)
Two photon production of pion pairs in e^+e_- collisions at 29 GeV, 14:43808 (R;US)
Use of a distributed movie-making system for presentation of fluid flow data, 14:43799 (R;US)

Lawrence Livermore National Lab., CA (USA)
50 MHz 12 MW induction linac current modulator, 14:43119 (R;US)
A conceptual design for an actively cooled, high-average-power electron-beam accelerator, 14:43120 (R;US)
A summary of research, assessment, and management capabilities applicable to the fields of hazardous waste, toxic materials, and environmental contamination, 14:43439 (R;US)
Advanced phosphate glasses for high average power lasers, 14:42942 (R;US)
Aerosol penetration measurements through protective clothing in small scale simulation tests, 14:42612 (R;US)
Analysis of DC magnetron sputtered beryllium films, 14:44136 (R;US)
Calculation of the nuclear quadrupole resonance spectra of $YBa_2Cu_3O_{7-x}$, 14:44166 (R;US)
Cold confusion, 14:44190 (R;US)
Commercial high current ignitron development: Revision 1, 14:44293 (R;US)
Comparison of the electronic structure of La_2CuO_4, La_2NiO_4, and K_2CuF_4, 14:42518 (R;US)
Conventional weapons demilitarization: A health and environmental effects data base assessment: Propellants and their co-contaminants, 14:43656 (R;US)
Criterion for the superfluid/superconducting phase transition in two dimensions, 14:44167 (R;US)
Estimates of the radiological dose from ingestion of ^{137}Cs and ^{90}Sr to infants, children, and adults in the Marshall Islands, 14:43624 (R;US)
Flow, heat transfer, and wavefront distortion in a gas cooled disk amplifier, 14:42943 (R;US)
Generation of (3/2)ω_0 radiation in inhomogeneous plasmas under the irradiation of intense electromagnetic waves: Final report, April 3, 1987–September 30, 1988, 14:44221 (R;US)
Magnetic pair breaking in $Y_{1-x}Pr_xBa_2Cu_3O_7$, 14:42519 (R;US)
Modeling flashlamp-pumped ND:glass disk amplifiers, 14:44292 (R;US)

Mouse model for somatic mutation at the HPRT [hypoxanthine phosphoribosyl-transferase] gene: Molecular and cellular analyses, 14:43625 (R;US)
Multiple gauges for in situ measurements of pressure and particle velocity in condensed materials, 14:43244 (R;US)
Optical Cerenkov measurements of emittance growth in the ATA beam under laser ion-guiding, 14:43079 (R;US)
Overview of the DOE packaging review guide and the review process, 14:42919 (R;US)
Protecting x-ray diagnostic film in high-explosive experiments, 14:43306 (R;US)
Pulse and microwave characterization of a fiber-optic transmission link, 14:42920 (R;US)
Simultaneous multiple frequency interferometry: An application of homodyne phase measurement, 14:44220 (R;US)
Tubing wastage in fluidized-bed coal combustors (TVA, 20 megawatt AFBC Pilot Plant), 14:41491 (R;US)

LGL Ecological Research Associates, Inc., Bryan, TX (USA)
Evaluation of environmental information for the Unimak Pass Area, Alaska. Final report, 14:41566 (R;US)

Life Systems, Inc., Cleveland, OH (USA)
Toxicological Profile for Arsenic. Final report, 14:43645 (R;US)

Little (Arthur D.), Inc., Cambridge, MA (USA)
Industrial utilization of heat exchangers for waste-heat recovery in New York State. Final report, 14:42359 (R;US)

Lockheed Missiles and Space Co., Inc., Palo Alto, CA (USA). Research and Development Div.
Semiconductor surface-emitting laser diodes. Final draft report, 14:42935 (R;US)

Lockheed Missiles and Space Co., Palo Alto, CA (USA). Lockheed Palo Alto Research Lab.
Simultaneous radial and pitch-angle diffusion in the outer electron radiation belt. Report for 20 May 1985-1 January 1988, 14:43752 (R;US)

London (W.P.) and Associates Ltd., Niagara Falls, ON (Canada)
An assessment of airflow measurement techniques, 14:43035 (R;CA)

Los Alamos National Lab., NM (USA)
A nonlinear model for DNA dynamics, 14:43553 (R;US)
A study on the contribution of slow reaction in detonation, 14:43304 (R;US)
Coherent anti-Stokes Raman spectroscopy of shock-compressed liquid oxygen, 14:42692 (R;US)
Continuum spectra for gamma-ray bursts: Suppressing the soft photons, 14:43726 (R;US)
Corrosion study of simulated evaporator components, 14:41690 (R;US)
Electron temperature measurements of field-reversed configuration plasmas on the FRX-C/LSM experiment, 14:44215 (R;US)
General-Purpose Heat Source development: Extended series test program large fragment tests, 14:41797 (R;US)
High speed single transient microwave spectrum analyzer, 14:43268 (R;US)
High-energy helium backscattering for the compositional analysis of thin-film oxide-superconductors, 14:44164 (R;US)
High-temperature/high-pressure x-ray diffraction: Recent developments, 14:44132 (R;US)
LANSCE [Manuel Lujan, Jr. Neutron Scattering Center] target system performance, 14:41793 (R;US)
Learning to use the finite-element mesh generator, ESCHER 3.2, 14:44373 (R;US)
Materials accounting and international safeguards for MOX facilities, 14:41775 (R;US)
Monte Carlo calculations of the vacuum Compton detector sensitivities, 14:43216 (R;US)
NIST–Los Alamos racetrack microtron status, 14:43068 (R;US)
Novel lutetium spectroscopic interactions via cw RIMS [Resonance Ionization Mass Spectrometry], 14:42693 (R;US)
Observation of excited H^0 atoms produced by relativistic H^- ions in carbon and formvar foils, 14:43774 (R;US)
Observations of azimuthal asymmetry for certain FRC operating regimes, 14:44216 (R;US)
Optimization of the constrained algebraic reconstruction technique for the performance of a variety of visual tasks, 14:44374 (R;US)
Overview of irradiation effects research on insulating ceramics, 14:42509 (R;US)
Peregrinations on cold fusion, 14:44189 (R;US)
Performance of the high power rf system for the NIST–Los Alamos racetrack microtron, 14:43098 (R;US)
Report on the performance and operating characteristics of the Burle C83061E QUANTACON™ photomultiplier tube, 14:43218 (R;US)
Shock recovery experiments: An assessment, 14:42462 (R;US)
Status of PSR [Proton Storage Ring], 14:43139 (R;US)
Superconductivity from valence fluctuations with finite u, 14:44163 (R;US)
The EUV emission of cataclysmic variables, 14:43727 (R;US)
The soft-sphere model for metals near the critical point, 14:43798 (R;US)
Vibrational frequency shifts of fluid nitrogen fundamental and hot band transitions as a function of pressure and temperature, 14:43773 (R;US)
Working with some of the newer high-Z scintillators, 14:43217 (R;US)

Louisiana Gasification Technology, Inc., Plaquemine, LA (USA)
Environmental-Monitoring Plan for the Dow Syngas Project. Annual report, April 1, 1986-March 31, 1987, 14:41438 (R;US)
Environmental-Monitoring Plan for the Dow Syngas Project. Annual report, April 1, 1987-March 31, 1988, 14:41439 (R;US)
Environmental-Monitoring Plan for the Dow Syngas Project: commissioning phase preliminary report, April 1, 1987 through June 30, 1988: Volume 1-4, 14:41440 (R;US)

Louisiana State Univ., Baton Rouge, LA (USA)
Formation and destruction of nitrogen oxides in coal combustion: Sixth quarterly report, April 1, 1989–June 30, 1989, 14:41486 (R;US)

Louisiana State Univ., Baton Rouge, LA (USA). Dept. of Petroleum Engineering
Cyclic CO_2 injection for light oil recovery: Performance of a cost shared field test in Louisiana: Summary annual report, 14:41532 (R;US)

Louisiana State Univ., Baton Rouge, LA (USA). Dept. of Physics and Astronomy
Solar flares and magnetospheric particles: investigations based upon the ONR-602 and ONR-604 experiments. Annual letter report for period ending 30 November 1988, 14:43737 (R;US)

Lund Univ. (Sweden). Dept. of Mathematical Physics
An approximate method for calculating the deformation of rotating nuclei, 14:43999 (R;SE)

Lurgi G.m.b.H., Frankfurt am Main (Germany, F.R.)
Gasification of lignite and wood in the Lurgi circulating fluidized-bed gasifier: Final report, 14:41433 (R;US)

Lycott Environmental Research, Inc., Southbridge, MA (USA)
Eutrophication and watershed study of Stoneville reservoir for the town of Auburn, Massachusetts. Final report, 14:43501 (R;US)

Lyon-1 Univ., 69 - Villeurbanne (France). Inst. de Physique Nucleaire
Using the combination CsI(Tl) + photodiode for identification and energy measurement of light particles, 14:43221 (R;FR)

M

M.L. Energia, Inc., Princeton, NJ (USA)
Infrared multiphoton ignition and enhancement of combustion. Final report, 14:42898 (R;US)

Manitoba Dept. of Energy and Mines, Winnipeg, MB (Canada)
Supplementary information for legislative review, 1987-88 estimates, 14:42266 (R;CA)

Manitoba Dept. of Energy and Mines, Winnipeg, MB (Canada). Petroleum Div.
1986 Annual production statistics report [Manitoba], 14:41536 (R;CA)

Manitoba Dept. of Environment and Workplace Safety and Health, Winnipeg, MB (Canada). Water Standards and Studies Section
Canada-Manitoba agreement on the study and monitoring of mercury pollution in the diversion system of the Churchill River. Summary report and technical appendices, 14:41828 (R;CA)

Manitoba HVDC Research Centre, Winnipeg, MB (Canada)
Modelling of transformer saturation in stability studies, 14:41940 (R;CA)

Manitoba Hydro, Winnipeg, MB (Canada)
Post-tensioning of concrete semi-spiral case and intake piers for hydraulic structures, 14:41826 (R;CA)

Manitoba Oil and Gas Corp., Winnipeg, MB (Canada)
Manitoba oil and gas corporation annual report, 1986, 14:41557 (R;CA)

Manitoba Research Council, Winnipeg, MB (Canada). Industrial Technology Centre
An investigation of the corrosion fatigue behaviour magnetic metallic glasses. Final report, 14:42465 (R;CA)

Marburg Univ. (Germany, F.R.). Fachbereich 13 Physik
Electric properties of amorphous silicon (a-Si:H) and amorphous alloys ($a\text{-}Si_{1-x}C_x$:H, $a\text{-}Si_{1-x}Ge_x$:H). Final report, 14:41844 (R;DE;In German)

Maryland Power Plant Research Program, Annapolis, MD (USA)
Acid deposition in Maryland: summary of results through 1988. Annual report, 14:43381 (R;US)

Maryland Univ., College Park, MD (USA). Dept. of Civil Engineering
Assessment of the potential for transport of dioxins and codisposed materials to ground water. Report for 26 December 1986-25 January 1988, 14:43492 (R;US)

Maryland Univ., College Park, MD (USA). Lab. for Plasma and Fusion Energy Studies
Quantitative spectroscopy of x-ray laser plasmas in pulsed power. Annual progress report, April 1988-March 1989, 14:44246 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA)
Femtosecond pulse generation in a laser with nonlinear external resonator, 14:42930 (R;US)
The SLD [SLC Large Detector] calorimeter systems, 14:43242 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Civil Engineering
Estimates of macrodispersivity based on analyses of hydraulic conductivity variability at the MADE [Microdispersion Experiment] site: Interim report, 14:43488 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Dept. of Physics
Low temperature and neutron physics studies: Final progress report, March 1, 1986–May 31, 1987, 14:44004 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Lab. for Electromagnetic and Electronic Systems
Theoretical models for interaction of electromagnetic fields with biological tissues. Final report, 1 July 1986-1 July 1988, 14:43662 (R;US)

Massachusetts Inst. of Tech., Cambridge, MA (USA). Research Lab. of Electronics
Quantum theory of the nonlinear interferometer, 14:43257 (R;US)
Reexamination of magnetic effects in the Bose gas, 14:44148 (R;US)

Massachusetts Inst. of Tech., Lexington, MA (USA). Lincoln Lab.
Defect-related dielectric breakdown, charge trapping, and interface-state generation of gate oxides grown on zone-melting-recrystallized silicon-on-insulator films, 14:43017 (R;US)
Effect of finite lower-level lifetime on q-switched laser, 14:42933 (R;US)
Novel scalloped-mirror diffraction-coupled InGaAsP/InP buried-heterostructure laser arrays, 14:42934 (R;US)
Prospects for classifying complex imagery using a self-organizing neural network. Project report, 14:44344 (R;US)

Massachusetts Univ., Amherst, MA (USA). Dept. of Chemistry
Radiolysis of poly(acetaldehyde-co-chloral), a positive E-beam resist. Technical report, 14:42798 (R;US)

Materials Research Labs., Ascot Vale (Australia)
Corrosion of high-density sintered tungsten alloys. Part 3. Electrochemical tests, 14:42432 (R;AU)

McDonnell Aircraft Corp., St. Louis, MO (USA)
Low-energy-consumption hydraulic techniques. Final technical report, August 1984-April 1988, 14:42341 (R;US)

Michigan State Univ., East Lansing, MI (USA). Dept. of Mechanical Engineering
Effect of water on piloted ignition of cellulosic materials. Annual progress report. Doctoral thesis, 14:42899 (R;US)

Michigan Technological Univ., Houghton, MI (USA). Dept. of Chemistry and Chemical Engineering
Characterization and suitability of superclean coals for hydroliquefaction feedstocks: Final report, 14:41426 (R;US)

Michigan Technological Univ., Houghton, MI (USA). Inst. of Materials Processing
Surface magnetic enhancement for coal cleaning: Quarterly progress report No. 2, May 1, 1988–July 31, 1988, 14:41431 (R;US)

Michigan Univ., Ann Arbor, MI (USA). Dept. of Nuclear Engineering
Population inversions in ablation plasmas generated by intense electron beams. Final report, 1 November 1985-31 October 1988, 14:43793 (R;US)
The role of grain boundary character in the environmentally-assisted integranular cracking mechanism of nickel-base alloys: Progress report, August 1, 1988–July 31, 1989, 14:42447 (R;US)

Michigan Univ., Ann Arbor, MI (USA). W.E. Lay Automotive Lab.
Valve train forces and friction in advanced technology diesel engines: Annual progress report No. 1, 14:42400 (R;US)

Midwest Research Inst., Cary, NC (USA)
Operation and maintenance of hospital medical-waste incinerators. Final report, 14:42393 (R;US)

Minerals Management Service, Reston, VA (USA)
Oil-spill risk analysis: Central and Western Gulf of Mexico (Proposed Lease Sales 118 and 122) Outer Continental Shelf. Final report, 14:41570 (R;US)

Minnesota Univ., Minneapolis, MN (USA)
Population model for Alaska Peninsula sea otters. Final report, 14:43471 (R;US)

MK-Ferguson Co., St. Charles, MO (USA)
Chemical soil investigation report for the Weldon Spring Chemical Plant/Raffinate Pits, Phase II, 14:41762 (R;US)
Waste assessment chemical characterization of the Weldon Spring site Raffinate Pitts, 14:41763 (R;US)

Monenco Consultants Ltd., Calgary, AB (Canada)
The assessment, evaluation and validation of a computer based simulation model. Final report, 14:41622 (R;CA)

Monenco Consultants Ltd., St. Catherines, ON (Canada)
Instrument loop diagrams pilot plant electronic instrumentation system. Phase 1, task 1 and 2, 14:41545 (R;CA)

Monenco Maritimes Ltd., Fredericton, NB (Canada)
Fish passage mortality in a tube turbine, 14:41829 (R;CA)

Montana Univ., Missoula, MT (USA). Wood Chemistry Lab.
Catalysis of carbon gasification: influence of different modes of addition of catalysts. Annual report, January 1988-January 1989, 14:41805 (R;US)

Montpellier-2 Univ., 34 (France)
Study of phase diagrams U - O - Na, Pu - O - Na and U, Pu - O - Na, 14:42015 (R;FR;In French)

Montreal Univ., PQ (Canada). Centre de Recherche sur les Transports
A model for the strategic planning of national freight transportation, 14:42332 (R;CA)

Moskovskij Gosudarstvennyj Univ., Moscow (USSR)
4. All-union conference on low temperature chemistry. Summaries of reports, 14:42624 (R;SU;In Russian)
Thermodynamics and thermochemistry of solutions. Proceedings of the institute. Issue 148, 14:42725 (R;SU;In Russian)

Moskovskij Khimiko-Tekhnologicheskij Inst., Moscow (USSR)
Thermodynamics and thermochemistry of solutions. Proceedings of the institute. Issue 148, 14:42725 (R;SU;In Russian)

MSE, Inc., Butte, MT (USA)
[Manage, operate, and maintain the component development and integration facility in Butte, MT: Quarterly technical progress report, April 1-June 20, 1989, 14:42288 (R;US)

N

Nagoya Univ. (Japan). Inst. of Plasma Physics
Courant condition free modified partially-implicit method. Revised electromagnetic particle code PS2M for bounded plasmas with conducting walls, 14:44207 (R;JP)
Rotating magnetic probe, 14:44208 (R;JP;In Japanese)

Naples Univ. (Italy). Ist. di Fisica
Technical-economical analysis of photovoltaic systems for residential use, 14:41856 (R;IT;In Italian)

National Academy of Sciences, Washington, DC (USA). Commission on Natural Resources
Decision making for regulating chemicals in the environment, 14:42226 (R;US)

National Aeronautics and Space Administration, Cleveland, OH (USA). Lewis Research Center
Determination of combustion gas temperatures by infrared radiometry in sooting and nonsooting flames. Technical paper, 14:42890 (R;US)
Fuel-rich catalytic combustion of Jet-A fuel - equivalence ratios 5.0 to 8.0. Technical memo, 14:41587 (R;US)

National Bureau of Standards, Washington, DC (USA). Center for Building Technology
Epoxy impregnation of hardened cement pastes for characterization of microstructure. Interim report, 14:42597 (R;US)

National Bureau of Standards, Washington, DC (USA). Center for Fire Research
Combustion of oil on water. November 1987, 14:41553 (R;US)

National Bureau of Standards, Washington, DC (USA). Center for Radiation Research
DCTDOS: neutron and gamma penetration in composite duct systems, 14:44013 (R;US)
Energy levels of molybdenum, Mo 1 through 42, 14:43778 (R;US)
NBS (National Bureau of Standards) measurement services: calibration of gamma-ray-emitting brachytherapy sources. Final report, 14:43569 (R;US)

National Communications Systems, Washington, DC (USA)
Fallout radiation effects analysis methodology. Final report, 14:43313 (R;US)

National Conference of State Legislatures, Denver, CO (USA)
Survey of state ground-water-quality protection legislation enacted from 1985 through 1987, 14:43524 (R;US)

National Energy Board, Ottawa, ON (Canada)
Alberta and Southern Gas Co. Ltd. Reasons for decision, 14:41598 (R;CA)
Alberta and Southern Gas Co. Ltd.. Reasons for decision, 14:41599 (R;CA;In French)
North Canadian Oils Limited. Reasons for decision, 14:41609 (R;CA)
North Canadian Oils Limited. Reasons for decision, 14:41610 (R;CA;In French)
Reasons for decision in the matter of Amoco Canada Petroleum Co. Ltd., 14:41607 (R;CA)
Reasons for decision in the matter of an application under the National Energy Board Act of British Columbia Hydro and Power Authority, 14:42267 (R;CA;In French)
Reasons for decision in the matter of Amoco Canada Petroleum Co. Ltd., 14:41608 (R;CA;In French)

National Engineering Lab. (NBS), Washington, DC (USA)
Thermal and economic analysis of three HVAC (heating, ventilating, and air conditioning) system types in a typical VA (Veterans Administration) patient facility, 14:42313 (R;US)

National Fisheries Inst., Inc., Washington, DC (USA)
Study to determine the possible hazard of methylmercury in seafood to the fetus in utero. Final report, 1980-1985, 14:43644 (R;US)

National Fishery Research Lab., La Crosse, WI (USA)
Investigations in fish control: 98. History of acute toxicity tests with fish, 1863-1987, 14:43647 (R;US)

National Geophysical Data Center, Boulder, CO (USA)
Solar-Geophysical Data Number 534, February 1989. Part 2 (comprehensive reports). Data for August 1988 and miscellaneous, 14:43730 (R;US)

National Inst. for Coal Research, Pretoria (South Africa)
Suggested rapid method for the determination of the liability to spontaneous combustion of coal. Special report, 14:41502 (R;ZA)

National Inst. for Occupational Safety and Health, Cincinnati, OH (USA)
Characterization of silica in the lungs of autopsied coal miners. Final report, 14:41503 (R;US)
Construction and testing of a vapor sensor based on ion mobility and gas flow, 14:43390 (R;US)
Health-hazard evaluation determination report No. 77-37-413, Gates Rubber Company, Denver, Colorado, 14:43373 (R;US)
Health-hazard evaluation determination report No. 76-31-338, Becton-Dickinson, Division of Becton-Dickinson and Company, Juncos, Puerto Rico, 14:43374 (R;US)
Health-hazard evaluation determination report No. 75-150-378, Reinell Boats, Inc., Poplar Bluff, Missouri, 14:43375 (R;US)
Health-hazard evaluation determination report No. 75-11-403, Port of Duluth-Superior Grain Elevators, Duluth, Minnesota and Superior, Wisconsin, 14:43376 (R;US)
Health-hazard evaluation determination report No. 77-15-421, Leeds and Northrup Corporation Expendable Devices Division, Ellwood City, Pennsylvania, 14:43377 (R;US)
Health-hazard evaluation determination report No. 77-68-417, the Washington Post Company, Washington, DC, 14:43378 (R;US)
Health-hazard evaluation determination report No. 77-10-412; American Smelting and Refining Company, Denver, Colorado, 14:43642 (R;US)
Health-hazard evaluation determination report No. 77-22-409, Purex Corporation, London, Ohio, 14:43380 (R;US)
Health-hazard evaluation report HETA-88-335-1940, Fort Stanwix National Monument, Rome, New York, 14:43386 (R;US)
Health-hazard evaluation report HETA-88-311-0000, Office of Disability Determination, The Howard Building, Tampa, Florida, 14:43387 (R;US)
Health-hazard evaluation report HETA-88-287-1942, Saint Mary-Corwin Hospital, Pueblo, Colorado, 14:43388 (R;US)
Health-hazard evaluation report No. HETA-88-054-1936, US Customs Service, Washington, DC, 14:43392 (R;US)
Health-hazard evaluation report No. HETA-88-136-1945, Miller Thermal Technologies, Inc., Appleton, Wisconsin, 14:43663 (R;US)
Health-hazard evaluation report No. HETA-88-258-1941, University Hospital, Denver, Colorado, 14:43393 (R;US)
Health-hazard evaluation report No. HETA-88-166-1944, Hoeganaes Magnetic Materials, Rancocas, New Jersey, 14:43394 (R;US)
Health-hazard evaluation report No. HETA-84-474-1946, Electric Boat Division, General Dynamics Corporation, Groton, Connecticut, 14:43395 (R;US)
Health-hazard evaluation report No. HETA-87-099-1938, Louisiana-Pacific Corporation, Olathe, Colorado, 14:43396 (R;US)
Industrial-hygiene survey report of Delta Air Lines, Inc. Technical Operations Center, Hartsfield Atlanta International Airport, 14:43384 (R;US)
Industrial-hygiene survey report of Defense Fuel Support Point, Cincinnati, Ohio, 14:41576 (R;US)
Industrial-hygiene survey report of Pan American Tannery, Gloverville, New York, 14:43385 (R;US)

National Inst. for Occupational Safety and Health, Morgantown, WV (USA)
Health-hazard evaluation report mHETAa-87-110-1943, Columbia Farms Poultry Plant, Columbia, South Carolina, 14:43391 (R;US)

National Inst. for Petroleum and Energy Research, Bartlesville, OK (USA)
Development of analytical procedures for coprocessing: Quarterly progress report, January 1–March 31, 1989, 14:41430 (R;US)
Study to determine the fate of benzene precursors in gasoline. Final report, 14:41552 (R;US)

National Inst. of Radiation Protection, Stockholm (Sweden)
The neutrino - an indirectly ionizing radiation, 14:44135 (R;SE)

National Inst. of Radiological Sciences, Chiba (Japan)
Annual report of National Institute of Radiological Sciences of the fiscal year 1986, 14:44340 (R;JP;In Japanese)
Environmental and health consequences in Japan due to the accident at Chernobyl nuclear reactor plant, 14:42103 (R;JP)
Radioactivity survey data in Japan, part 1. Environmental materials, 14:43447 (R;JP)
Radioactivity survey data in Japan, part 2. Dietary materials, 14:43585 (R;JP)

National Inst. of Standards and Technology (IMSE), Gaithersburg, MD (USA). Ceramics Div.
Advanced ceramics: a critical assessment of wear and lubrication. Topical report, June-October 1986, 14:42513 (R;US)
Mechanical-property enhancement in ceramic-matrix composites, April 1989. Interim report, 1 January-31 December 1988, 14:42598 (R;US)

National Inst. of Standards and Technology (NEL), Gaithersburg, MD (USA). Center for Building Technology
Friability of spray-applied fireproofing and thermal insulations: field evaluation of prototype test devices, 14:42599 (R;US)
Illumination conditions and task visibility in daylit spaces, 14:42314 (R;US)

National Inst. of Standards and Technology, Gaithersburg, MD (USA)
NIST–Los Alamos racetrack microtron status, 14:43068 (R;US)
Performance of the high power rf system for the NIST–Los Alamos racetrack microtron, 14:43098 (R;US)

National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)
Improvements on monitor system in the KEK 2.5-GeV linac, 14:43112 (R;JP)
KENS report-7, 1987/88, 14:43043 (R;JP)
Proceedings of the second meeting on physics at TeV energy scale, 14:43807 (R;JP)
Proceedings of the workshop on neutron scattering research with intense spallation neutron source 'today and tommorrow'. First meeting of Japan-UK collaboration in neutron scattering research, 14:44011 (R;JP)

National Marine Fisheries Service, Seattle, WA (USA). Northwest and Alaska Fisheries Center
National Benthic Surveillance Project: Pacific Coast, Part 1. Summary and overview of the results for cycles 1 to 3 (1984-86). Technical memo, 14:43498 (R;US)

National Mechanical Engineering Research Inst., Pretoria (South Africa). Heat Mechanics Div.
Microcomputer-aided design of air-conditioning systems: reference manual for program BSIMAC (Version 2.0-1987). Information document, 14:42312 (R;ZA)

National Ocean Pollution Program Office, Rockville, MD (USA)
National Marine Pollution Orogram: federal plan for ocean pollution research, development, and monitoring, fiscal years 1988-1992, 14:43521 (R;US)

National Ocean Service, Anchorage, AK (USA). Ocean Assessments Div.
Outer Continental Shelf environmental assessment program. Final reports of principal investigators. Volume 59, 14:41567 (R;US)

National Research Council of Canada, Boucherville, PQ (Canada). Industrial Materials Research Inst.
Continuation of investigation of the effects of mechanical stress on the magnetic properties of pipeline steels for application in pipeline stress monitoring. Final report, July '84-July '86, 14:42913 (R;CA)

National Research Council of Canada, Ottawa, ON (Canada)
A strategy for tribology in Canada. Enhancing reliability and efficiency through the reduction of wear and friction, 14:42243 (R;CA)
Development of an analytical methodology for the characterization of the products of biomass and peat liquefaction, 14:41847 (R;CA;In French)
Experimental lake area atmospheric corrosion program. Report for the period December 1984 - November 1985, 14:43331 (R;CA)
Performance of the Holyrood I 50kW VAWT [vertical axis wind turbine], June 1978 to September 1981. Technical memorandum, 14:41904 (R;CA)

National Research Council, Washington, DC (USA). Commission on Engineering and Technical Systems
Mobile electric power technologies for the Army of the future: engines, power source, and electrical aspects, 14:42289 (R;US)

National Research Council, Washington, DC (USA). Committee on Toxicology
Emergency and continuous exposure guidance levels for selected airborne contaminants: Volume 8. Lithium chromate and trichloroethylene. Final report, 14:43638 (R;US)

National Research Council, Washington, DC (USA). Transportation Research Board
Breaking/cracking and seating concrete pavements. Final report, 14:42595 (R;US)
HRIS (Highway Research Information Service) Abstracts. Volume 20, Number 4 - Winter 1987, 14:42335 (R;US)
HRIS (Highway Research Information Service) Abstracts. Volume 21, Number 2 - Summer 1988, 14:42336 (R;US)

National Space Technology Labs., NSTL Station, MS (USA)
Stabilization of crab scrap and processing waste water. Final report, 1984-1986, 14:41804 (R;US)

National Technical Information Service, Springfield, VA (USA)
Acid mine drainage. October 1978-May 1989 (Citations from the NTIS data base). Report for October 1978-May 1989, 14:41469 (R;US)
Alcohol fuels. November 1987-May 1989 (Citations from the COMPENDEX data base). Report for November 1987-May 1989, 14:41809 (R;US)
Alcohol fuels. October 1985-October 1987 (Citations from the COMPENDEX data base). Report for October 1985-October 1987, 14:41808 (R;US)
Battery electrodes: properties and performance. June 1987-May 1989 (Citations from the COMPENDEX data base). Report for June 1987-May 1989, 14:42211 (R;US)
Bioaccumulation of heavy metals by fish. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989, 14:43649 (R;US)
Biodeterioration of oil spills. January 1970-April 1989 (Citations from the NTIS data base). Report for January 1970-April 1989, 14:41579 (R;US)
Biological effects of electrical or magnetic field application. April 1987-May 1989 (Citations from the Life Sciences Collection data base). Report for April 1987-May 1989, 14:43664 (R;US)
Boiler and steam-generator corrosion. January 1970-May 1989 (Citations from the NTIS data base). Report for January 1970-May 1989, 14:41919 (R;US)
Boron, metal, and aramid fiber reinforced plastics. January 1973-May 1989 (Citations from the Rubber and Plastics Research Association data base). Report for January 1973-May 1989, 14:42600 (R;US)
Coal tar technology. January 1970-June 1989 (Citations from the NTIS data base). Report for January 1970-June 1989, 14:41444 (R;US)
Cogeneration: economic and technical analysis. August 1983-May 1989 (Citations from the NTIS data base). Report for August 1983-May 1989, 14:42257 (R;US)
Computer-aided design and manufacturing: optical equipment. January 1970-June 1989 (Citations from the NTIS data base). Report for January 1970-June 1989, 14:43020 (R;US)
Effluent treatment in the paint and coating industry. January 1980-May 1989 (Citations from World Surface Coatings Abstracts). Report for January 1980-May 1989, 14:42373 (R;US)
Energy conservation through building design. October 1984-April 1989 (Citations from the NTIS data base). Report for October 1984-April 1989, 14:42318 (R;US)
Hazardous-materials waste disposal. June 1987-May 1989 (Citations from the NTIS data base). Report for June 1987-May 1989, 14:42372 (R;US)
Heat pipes. January 1970-June 1989 (Citations from the US Patent data base). Report for January 1970-June 1989, 14:42986 (R;US)
Hydrogen production. September 1984-May 1989 (Citations from the NTIS data base). Report for September 1984-May 1989, 14:41799 (R;US)

Leachate treatment. January 1977-April 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-April 1989, 14:43438 (R;US)

Magnetic refrigeration: materials, design, and applications. January 1975-April 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1975-April 1989, 14:42915 (R;US)

Metal matrix composites. January 1970-May 1989 (Citations from the US Patent data base). Report for January 1970-May 1989, 14:42604 (R;US)

Metals recovery from wastes. June 1970-April 1988 (Citations from the COMPENDEX data base). Report for June 1970-April 1988, 14:42370 (R;US)

Metals recovery from wastes. May 1988-April 1989 (Citations from the COMPENDEX data base). Report for May 1988-April 1989, 14:42371 (R;US)

Mineralogical exploration indicators. January 1970-May 1989 (Citations from the COMPENDEX data base). Report for January 1970-May 1989, 14:42240 (R;US)

Natural reserve areas: ecology and preservation. January 1970-May 1989 (Citations from the NTIS data base). Report for January 1970-May 1989, 14:42241 (R;US)

Neodymium-iron-boron (Nd-Fe-B) permanent magnets. January 1984-May 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for January 1984-May 1989, 14:42467 (R;US)

Noise control for motor vehicles. January 1970-June 1989 (Citations from the COMPENDEX data base). Report for January 1970-June 1989, 14:43665 (R;US)

Nondestructive testing for microelectronics, semiconductors, and superconductors. January 1972-June 1989 (Citations from the International Aerospace Abstracts data base). Report for January 1972-June 1989, 14:43008 (R;US)

Ozone depletion studies. January 1972-April 1989 (Citations from the International Aerospace Abstracts data base). Report for January 1972-April 1989, 14:43399 (R;US)

Parallel processing. July 1985-May 1988 (Citations from the NTIS data base). Report for July 1985-May 1988, 14:44377 (R;US)

Parallel processing. June 1988-June 1989 (Citations from the NTIS data base). Report for June 1988-June 1989, 14:44378 (R;US)

Plastics and elastomers: offshore applications. January 1973-November 1985 (Citations from the Rubber and Plastics Research Association data base). Report for January 1973-November 1985, 14:42601 (R;US)

Plastics and elastomers: offshore applications. December 1985-May 1989 (Citations from the Rubber and Plastics Research Association data base). Report for December 1985-May 1989, 14:42602 (R;US)

Polyethelene terephthalate (PET) scrap recycling. January 1973-May 1989 (Citations from the Rubber and Plastics Research Association data base). Report for January 1973-May 1989, 14:42603 (R;US)

Pulse combustion: devices and applications. January 1970-June 1989 (Citations from the US Patent data base). Report for January 1970-June 1989, 14:43032 (R;US)

Radioactive pollution: ocean environments. January 1974-May 1989 (Citations from Oceanic Abstracts). Report for January 1974-May 1989, 14:43516 (R;US)

Radon detection and measurement. January 1970-May 1989 (Citations from the COMPENDEX data base). Report for January 1970-May 1989, 14:43418 (R;US)

Recycling metal scrap. June 1970-April 1989 (Citations from the COMPENDEX data base). Report for June 1970-April 1989, 14:42369 (R;US)

Silicon nitrides. January 1970-May 1989 (Citations from the US Patent data base). Report for January 1970-May 1989, 14:42514 (R;US)

Silicon-carbide-reinforced aluminum composites. January 1972-June 1989 (Citations from the International Aerospace Abstracts data base). Report for January 1972-June 1989, 14:42605 (R;US)

Sludge dewatering: sewage and industrial wastes. January 1978-April 1989 (Citations from Pollution abstracts). Report for January 1978-April 1989, 14:42394 (R;US)

Solar drying of crops and food. January 1970-May 1989 (Citations from the COMPENDEX data base). Report for January 1970-May 1989, 14:41872 (R;US)

Solid Lubricants: graphite, polymers, fluorides, and general studies. February 1982-May 1989 (Citations from the COMPENDEX data base). Report for February 1982-May 1989, 14:42606 (R;US)

Solid-waste reclamation and recycling: plastics. January 1970-May 1989 (Citations from the NTIS data base). Report for January 1970-May 1989, 14:42374 (R;US)

Stirling engines. January 1984-June 1989 (Citations from the NTIS data base). Report for January 1984-June 1989, 14:42405 (R;US)

Strategic defense and arms control. January 1970-April 1989 (Citations from the NTIS data base). Report for January 1970-April 1989, 14:42423 (R;US)

Thermionic cathodes. May 1985-June 1989 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities data base). Report for May 1985-June 1989, 14:42290 (R;US)

Toxicity bioassays: water-pollution effects on aquatic animals and plants. June 1986-June 1989 (Citations from the Selected Water Resources Abstracts data base). Report for June 1986-June 1989, 14:43652 (R;US)

Toxicity of fibers and fiber composites. January 1970-September 1988 (Citations from the NTIS data base). Report for January 1970-September 1988, 14:43650 (R;US)

Toxicity of fibers and fiber composites. October 1988-May 1989 (Citations from the NTIS data base). Report for October 1988-May 1989, 14:43651 (R;US)

Toxicity of halogenated organic compounds. March 1983-June 1988 (Citations from the NTIS data base). Report for March 1983-June 1988, 14:43653 (R;US)

Toxicity of halogenated organic compounds. July 1988-June 1989 (Citations from the NTIS data base). Report for July 1988-June 1989, 14:43654 (R;US)

Waste treatment by reverse osmosis and membrane processes: industrial. January 1976-June 1989 (Citations from the COMPENDEX data base). Report for January 1976-June 1989, 14:42375 (R;US)

Waste water and water treatment: anion exchange. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989, 14:43505 (R;US)

Waste-water treatment: lagoons. January 1977-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-May 1989, 14:43504 (R;US)

Water resources: effects of land use and urbanization. September 1981-June 1989 (Citations from the NTIS data base). Report for September 1981-June 1989, 14:43518 (R;US)

Wetlands legislation and management. January 1977-January 1988 (Citations from the Selected Water Resources Abstracts data base). Report for January 1977-January 1988, 14:43465 (R;US)

Wetlands legislation and management. February 1988-May 1989 (Citations from the Selected Water Resources Abstracts data base). Report for February 1988-May 1989, 14:43466 (R;US)

National Toxicology Program, Research Triangle Park, NC (USA)

Toxicology and carcinogenesis studies of crocidolite asbestos (CAS No. 12001-28-4) in F344/N rats (feed studies). Technical report, 14:43639 (R;US)

National Weather Service, South Minneapolis, MN (USA). National Remote Sensing Hydrology Program

Airborne gamma-radiation snow water-equivalent and soil-moisture measurements and satellite areal extent of snow-cover measurements. A user's guide. Version 3.0, 14:41795 (R;US)

Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)

Assessment of the efficiency of nondestructive techniques in materials testing studies based on the information criterion, 14:43004 (R;SU;In Russian)

Investigation and construction of algorithms for leakage detection in steam generators of the BN-600 reactor, 14:43006 (R;SU;In Russian)

Organization of data exchange between the BESM-6 and M-6000 computers for their processing in reactor materials testing automated scientific research system, 14:43005 (R;SU;In Russian)

Problems of developing the distributed control system for fuel element fabrication automation, 14:42049 (R;SU;In Russian)
Studying the noise characteristics of the BOR-60 reactor parameters, 14:42018 (R;SU;In Russian)

Nauchno-issledovatel'skij Inst. Ehlektrofizicheskoj Apparatury, Leningrad (USSR)
Damping radial betatron oscillations of electrons in the Erevan synchrotron, 14:43076 (R;SU;In Russian)

Naval Civil Engineering Lab., Port Hueneme, CA (USA)
Dynaflow user's guide, 14:43689 (R;US)

Naval Medical Research Inst., Bethesda, MD (USA)
Intensity threshold for 60-Hz magnetically induced behavioral changes in rats, 14:43657 (R;US)

Naval Postgraduate School, Monterey, CA (USA)
Atomic relaxation and vacancy-interstitial recombination in Zr and Zr3Al. Master thesis, 14:42429 (R;US)
Correlation between satellite-derived aerosol characteristics and oceanic dimethylsulfide (DMS). Master's thesis, 14:43340 (R;US)
Use of life-cycle costing in the development of standards. Master's thesis, 14:42303 (R;US)

Naval Research Lab., Washington, DC (USA)
Development of high-power CARM (cyclotron auto-resonance maser) oscillators. Memorandum report, October 1987-October 1988, 14:43016 (R;US)
Impact of the geoplasma on a spaceborne GPS (global positioning system) receiver system - a preliminary study. Memorandum report, 14:43739 (R;US)
Three-dimensional equilibrium and stability of ionospheric plasma clouds. Memorandum report, 14:43751 (R;US)
User's guide to RAYTRACE. Memorandum report, October 1987-April 1988, 14:43736 (R;US)

Naval Research Lab., Washington, DC (USA). Optical Sciences Div.
Radiation-response prediction of single-mode fibers. Final technical information bulletin, 14:43310 (R;US)

Naval Surface Warfare Center, Silver Spring, MD (USA)
Investigation of Li/SO2 cell hazards. 3. Raman spectroscopy of lithium dithionite. Report for June 1985-January 1986, 14:42197 (R;US)

Naval Weapons Center, China Lake, CA (USA)
RESOLVE (Research on Operations Limiting Visual extinction) project: visibility conditions and causes of visibility degradation in the Mojave Desert of California. Final report, 1983-1986, 14:43341 (R;US)
RESOLVE (Research on Operations Limiting Visual Extinction) project: visibility conditions and causes of visibility degradation in the mojave desert of California. Executive summary. Report for 1983-1986, 14:43342 (R;US)

Nebraska Univ., Lincoln, NE (USA). Dept. of Chemistry
Tandem mass spectrometry (MS/MS) for analysis of substituted polycyclic aromatic compounds in extracts of diesel-exhaust particulates. Final report, 14:42410 (R;US)

Nederlandse Commissie voor Stralingsdosimetrie, Bilthoven (Netherlands)
Proceedings of the symposium on thermoluminescence dosimetry, 14:43222 (R;NL)

New England Aquarium Corp., Boston, MA (USA). Harold E. Edgerton Research Lab.
Mechanisms and functional morphology associated with metal transport in Mercenaria mercenaria (Bavalvia: Mollusca): Final report, September 1, 1977–February 28, 1989, 14:43631 (R;US)

New Mexico Inst. of Mining and Technology, Socorro, NM (USA). New Mexico Petroleum Recovery Research Center
Rock matrix and fracture analysis of flow in western tight gas sands—Phase 4: 1988 Annual report, 14:41590 (R;US)

Analysis of surface modified colloidal silicas, 14:42742 (R;US)
Application of image analysis for infrared microspectroscopic detection of contaminants on microelectronic devices, 14:43021 (R;US)
Application of the IFCI [Integrated Fuel-Coolant Interaction] code to a FITS-type pouring mode experiment, 14:42131 (R;US)
Beta and gamma dose calculations for PWR and BWR containments, 14:42066 (R;US)
BLOT: A mesh and curve plot program for the output of a finite element analysis, 14:44379 (R;US)
Hydrogen and deuterium profiling in polymers using light and heavy ion elastic recoil detection, 14:42609 (R;US)
Prediction and data analysis of current pulses from impact-loaded piezoelectric polymers (PVDF) [Polyvinylidene Flouride], 14:42608 (R;US)
Second-order nonlinear optical devices in poled polymers, 14:42610 (R;US)
Shock compression and release in high-strength ceramics, 14:42515 (R;US)
Shock compression and release in high-strength ceramics, 14:42516 (R;US)
Structural aspects of the phase separation in $La_2CuO_{4.032}$, 14:42517 (R;US)
The Product Data Network and Distributed Data System: Node configuration, 14:44380 (R;US)
Thermodynamic tables for nuclear waste isolation: Vol. 1, Aqueous solutions database, 14:41733 (R;US)
X-ray lithography studies of polysilane using a laser plasma x-ray source, 14:42917 (R;US)

Sandia National Labs., Livermore, CA (USA)
A background traffic activity analysis in a canonical NATO [North Atlantic Treaty Organization] defense, 14:42424 (R;US)

Sao Paulo Univ., SP (Brazil). Inst. de Fisica
Hyperfine interactions and magnetic structure of R_{1+6} Fe_4B_4 (R=rare earth) intermetallic compounds, 14:42453 (R;BR)

Sargent and Lundy, Chicago, IL (USA)
Specifications for a plant electrical systems and equipment workstation: Final report, 14:41906 (R;US)

Saskatchewan Agriculture, Regina, SK (Canada)
Economics of natural air grain drying, 14:42376 (R;CA)

Saskatchewan Environment, SK (Canada). Air Pollution Control Branch
Sensitivity of Saskatchewan surface waters to acidic inputs, 14:43477 (R;CA)

Saskatchewan Geological Society, Regina, SK (Canada)
Proceedings of [the] fifth international Williston Basin symposium, 14:41510 (R;CA)

Saskatchewan Power Corp., Regina, SK (Canada)
Internal damping of ACSR [aluminum conductors steel-reinforced] conductors and alumoweld and galvanized steel ground wires, vol. 1, 14:41954 (R;CA)

Saskatchewan Univ., Saskatoon, SK (Canada). Saskatchewan Accelerator Lab.
Saskatchewan Accelerator Laboratory. Annual report 1986, 14:43047 (R;CA)

Scanda Consultants Ltd., Ottawa, ON (Canada)
Modifications and refinement of the computer model "wood burning simulator", 14:43033 (R;CA)

Science Applications International Corp., Chatsworth, CA (USA). Combustion Science and Advanced Technology Dept.
Model and computer code for the analysis of ribbon burners with application to a residential space heater: model description and user's manual. Topical report, September 1985-June 1986, 14:42317 (R;US)
Residential furnace data base. Topical report, 14:42316 (R;US)

Science Applications International Corp., La Jolla, CA (USA)
Numerical simulation of internal combustion engine flows development and testing of turbulence and swirling flow capability, 14:42403 (R;US)

Science Applications International Corp., Las Vegas, NV (USA)
Assessment of faulting and seismic hazards at Yucca Mountain, 14:41706 (R;US)

Science Applications International Corp., McLean, VA (USA)
Man-machine interface issues in nuclear power plants, 14:42057 (R;US)

Science Applications International Corp., San Diego, CA (USA)
Development of a predictive model for the weathering of oil in the presence of sea ice. Final report, 14:41569 (R;US)
Ocean-ice/oil-weathering computer program user's manual. Final report, 14:41568 (R;US)

Science Horizons, Inc., Encinitas, CA (USA)
SeisMs.NORSAR: a seismic monitoring system. (User's guide). Final technical report, 1 March 1985-30 September 1988, 14:43690 (R;US)

Science Research Lab., Inc., Somerville, MA (USA)
Compact, lightweight CO_2 lasers for SDIO applications. Final report, 30 September 1988-31 March 1989, 14:42937 (R;US)

Scientific Software Corp., Denver, CO (USA)
Development of improved technologies and techniques for reducing base gas requirements in underground natural gas storage facilities: mathematical model. Final report, December 1987-December 1988, 14:41617 (R;US)

Selskapet for Industriell og Teknisk Forskning, Trondheim (Norway)
Task 8, Passive and hybrid solar low energy buildings: Subtask A, Performance evaluation procedures, 14:41869 (R;FR)

Sherbrooke Univ., Quebec, PQ (Canada). Faculty of Applied Science
Performance of concrete panels exposed to ice abrasion at Navisivik, Baffin Island, 14:42611 (R;CA)

Siemens A.G., Muenchen (Germany, F.R.). Forschungslaboratorien
Amorphous silicon solar cells. Phase III. Final report, 14:41846 (R;DE;In German)

Siemens AG Unternehmensbereich KWU, Erlangen (Germany, F.R.)
Use of thorium fuel in light water reactors, studies performed by KWU, phase 2 A. Final report, 14:41971 (R;DE;In German)

Simons (H.A.) Ltd., Vancouver, BC (Canada)
A comparative assessment of forest biomass conversion to energy forms. Vol. 4, Data book of unit processes for primary conversion by direct combustion, 14:42377 (R;CA)

Skoda, Pizen (Czechoslovakia)
Analysis of the applicability of fracture mechanics on the basis of large scale specimen testing, 14:42470 (R;CS)
Measuring the thickness of austenitic weld deposits on carbon steel walls using a magnetic method, 14:43012 (R;CS)

SMA System-, Mess- und Anlagentechnik - Regelsysteme G.m.b.H., Niesetal (Germany, F.R.)
Building and test of a combined wind energy converter/heat pump plant for heat supply for the recreational area Spadener See, 14:42306 (R;DE;In German)

Small (B.M.) and Associates Ltd., Goodwood, ON (Canada)
Indoor air pollution and housing technology. Research report, 14:43404 (R;CA)

Solar Energy Research Inst., Golden, CO (USA)
High-efficiency $CuInSe_2$ and $CuInGaSe_2$ based cells and materials research: Annual subcontract report, 1 November 1987–31 October 1988, 14:41851 (R;US)
Low-cost technique for producing $Cd_{1-x}Zn_xTe$ devices for cascade cell application: Final subcontract report, 1 June 1987–15 December 1988, 14:41852 (R;US)

Southern Illinois Univ., Carbondale, IL (USA). Dept. of Mechanical Engineering and Energy Processes
Intermediates formed during supercritical desulfurization of coal: Final technical report, 14:41425 (R;US)

Southern Research Inst., Birmingham, AL (USA)
Characterization and modification of particulate properties to enhance filtration performance: Quarterly technical progress report, September–November 1988, 14:41456 (R;US)
Electrostatic precipitation of condensed acid mist: Third quarterly technical progress report, March 1–May 31, 1989, 14:41922 (R;US)
Humidification of flue gas to augment SO_2 capture by dry sorbents. Repprt for October 1985-July 1988 (Final), 14:41930 (R;US)
Review of current methods for measuring particulate matter including condensables from stationary sources. Final report, 14:43420 (R;US)

Southern Tier Central Regional Planning and Development Board, Corning, NY (USA)
Market-driven municipal/industrial waste-management model, 14:42228 (R;US)

Southwest Research Inst., San Antonio, TX (USA)
Characterization of exhaust emissions from trap-equipped light-duty diesels. Final report, 14:42412 (R;US)
Computer data base of emissions data for stationary reciprocating natural gas engines and gas turbines in use by the gas-pipeline-transmission industry. User's manual. Topical report, May 1987-February 1989, 14:41603 (R;US)
Experiments on densely-loaded non-Newtonian slurries in laminar and turbulent pipe flows: Final report, 14:41481 (R;US)
Velocity measurements of transparent non-Newtonian pipeline slurries with laser Doppler anemometry, 14:41477 (R;US)

Southwest Research Inst., San Antonio, TX (USA). Belvoir Fuels and Lubricants Research Facility
Effects of fuel properties and atomization on ignition in a T63 turbine combustor. Interim report, June 1985-December 1987, 14:42397 (R;US)
Evaluation of potential engine oils for use in administrative vehicles operating on M85 methanol fuel. Interim report, July 1985-November 1988, 14:42414 (R;US)
Field evaluation of all-season tactical engine oil OE/HDO-15/40 at Ft. Knox, Kentucky and Ft. Bliss, Texas. Interim report, July 1984-December 1985, 14:41547 (R;US)
Role of sulfur oxides in wear and deposit formation in Army diesel engines. Interim report, October 1985-September 1987, 14:42398 (R;US)

Southwest Research Inst., San Antonio, TX (USA). Fuels and Lubricants Research Div.
Calibration of nondestructive birefringence fuel thermal deposit rating device. Final report, September 1987-March 1988, 14:42891 (R;US)

Spider Engineering Associates (Waterloo), Inc., ON (Canada)
Prototype furnace construction, phase 4. Final report, 14:42320 (R;CA)

SRI International, Arlington, VA (USA). Strategic Studies Center
Soviet post-attack recovery: an initial assessment. Final report, February 1976-May 1978, 14:43318 (R;US)

SRI International, Menlo Park, CA (USA)
Development and validation of methods for sampling and analysis of workplace toxic substances. Research report, 14:43578 (R;US)
Diagnostics development for e-beam excited air channels. Technical report No. 4, 14:43794 (R;US)
Dynamics of excited high-lying states of H_2 and D_2. Final reportM 5 May 1986-4 October 1988, 14:43758 (R;US)
Ground-based measurements of Joule heating rates, 14:43746 (R;US)
Vaporization of trace element species from coal under gasification and combustion conditions: Final report, 14:41423 (R;US)

SRO Engineering Ltd., Montreal, PQ (Canada)
Residential combustion spillage monitoring, 14:43345 (R;CA)

Stanford Linear Accelerator Center, Menlo Park, CA (USA)
Effects of charged Higgs in τ decay, 14:43842 (R;US)
Requirements and limitations on beam quality in synchrotron radiation sources, 14:43078 (R;US)
The SLD [SLC Large Detector] calorimeter systems, 14:43242 (R;US)
Tracking with wire chambers at the SSC, 14:43243 (R;US)

Stanford Univ., CA (USA). Center for Space Science and Astrophysics
Geomagnetic disturbances. Final report, 1 October 1985-30 September 1988, 14:43719 (R;US)

Stanford Univ., CA (USA). Dept. of Chemical Engineering
Abatement of gaseous pollutants in coal-combustion exhaust gases employing a solid-oxide electrolyte: Progress report No. 1, 1 October–31 December 1986, 14:41458 (R;US)
Electrochemical abatement of gaseous pollutants in coal-combustion exhaust gases employing a solid-oxide electrolyte: Progress report No. 3, 1 April–30 June 1987, 14:41459 (R;US)
Electrochemical abatement of gaseous pollutants NO_x and SO_x in coal-combustion exhaust gases employing a solid-oxide electrolyte: Progress report No. 5, October 1–December 31, 1987, 14:41461 (R;US)

Stanford Univ., CA (USA). Dept. of Mechanical Engineering
A miniature fiber-optic probe for particle sizing, 14:43261 (R;US)
Optical sensing system for thermoplastic composites manufacturing, 14:42585 (R;US)
Optical waveguides in plasma-polymerized organic materials, 14:42584 (R;US)

Stanford Univ., CA (USA). Edward L. Ginzton Lab.
Research studies on extreme-ultraviolet and soft-x-ray lasers. Final technical report, 23 November 1985-22 November 1988, 14:42928 (R;US)

Stanford Univ., CA (USA). Electrocatalysis Lab.
Electrochemical abatement of pollutants NO_x and SO_x in combustion exhaust gases employing a solid-oxide electrolyte: [Quarterly report, July 1–September 30, 1987], 14:41460 (R;US)

Stapenhorst (F.W.E.), Inc., Pointe Claire, PQ (Canada)
Turbine generating sets, 14:41835 (R;CA)

State Univ. of New York, Albany, NY (USA)
High electric field phenomena in insulation. Final report, 15 November 1986-14 November 1988, 14:42575 (R;US)

State Univ. of New York, Albany, NY (USA). Atmospheric Sciences Research Center
[Maintenance of a rural precipitation chemistry center at Whiteface Mountain]: Progress report, 14:43350 (R;US)

State Univ. of New York, Binghamton, NY (USA). Dept. of Chemistry
Novel organoboranes as intermediates for ceramic precursors and high-energy fuels. Final technical report, 1 February 1985-31 August 1988, 14:42892 (R;US)

State Univ. of New York, Buffalo, NY (USA). Dept. of Electrical and Computer Engineering
Characterization of MeV ion-implanted GaInAs/GaAs using x-ray and Raman techniques, 14:42581 (R;US)

State Univ. of New York, Buffalo, NY (USA). Dept. of Physics and Astronomy
Effect of finite size on magnetoresistance, 14:42435 (R;US)

State Univ. of New York, Stony Brook, NY (USA)
Research in nuclear astrophysics: Stellar collapse and supernovae, progress report, 14:43722 (R;US)

Statens Energiverk, Stockholm (Sweden)
Operation of the Canadian FBC model, 14:41489 (R;SE)
Plant cultivation Salix. Final report of the period 1986-04-01–1989-03-31, 14:41853 (R;SE;In Swedish, English)
Primary measure to reduce the emissions of nitrogen oxide in circulating fluidized bed boilers, 14:41490 (R;SE)
Sulfur capture in fluidized bed boilers - the effect of combustion, 14:43034 (R;SE)
Thermal behavior of slumped zones in fluidized bed combustors, 14:41488 (R;SE)

Statens Provningsanstalt, Stockholm (Sweden)
Task 8, Passive and hybrid solar low energy buildings: Subtask A, Performance evaluation procedures, 14:41869 (R;FR)

Stelco, Inc., Hamilton, ON (Canada)
Develop and evaluat of the gas metal arc welding/submerged arc welding process for improved weld properties. Final report, 14:42468 (R;CA)

Strasbourg-1 Univ., 67 (France)
Contribution to the prediction of americium, plutonium and neptunium behaviour in the geosphere: chemical data, 14:43441 (R;FR;In French)

Strategic Defense Initiative Organization, Washington, DC (USA)
Report to the Congress on the Strategic Defense Initiative, 1989, 14:42245 (R;US)

Stuttgart Univ. (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme
Construction of an integrated system to solve partial differential equations on vector computers, 14:44372 (R;DE;In German)

Stuttgart Univ. (Germany, F.R.). Inst. fuer Physikalische Elektronik
Investigation of the combustion process of alternative fuels. Final report, 14:42420 (R;DE;In German)

Surface Rights Board, MB (Canada)
Manitoba surface rights board annual report, 1986-87, 14:41580 (R;CA)

Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden)
A Bayesian nonparametric estimation of distributions and quantiles, 14:44381 (R;SE)
Description of background data in the SKB database GEOTAB, 14:41745 (R;SE)
Fission product concentration profiles (Sr, Xe, Cs and Nd) at the individual grain level in power-ramped LWR fuel, 14:42702 (R;SE)
Near-distance seismological monitoring of the Lansjaerv neotectonic fault region. Pt. 2: 1988, 14:43699 (R;SE)
Rheological properties of sodium smectite clay, 14:41744 (R;SE)

Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Forest Genetics
Plant cultivation Salix. Final report of the period 1986-04-01–1989-03-31, 14:41853 (R;SE;In Swedish, English)

Synergic Resources Corp., Bala-Cynwyd, PA (USA)
Test marketing, 14:42277 (R;US)

Syracuse Univ., NY (USA). Dept. of Chemical Engineering and Materials Science
Particle deposition in granular media: Progress report, 14:42586 (R;US)

System Planning Corp., Arlington, VA (USA)
Tactical nuclear warfare studies. Final report, March-September 1975, 14:43320 (R;US)

T

Tar Industries Services, Chesterfield (UK)
Pitch insolubles - their nature, properties and substitution, 14:41443 (R;XE)

TDA Research, Inc., Wheat Ridge, CO (USA)
CO_2 sources for methane synthesis. Topical report No. 1, February 1988-March 1989, 14:41604 (R;US)

Technical Univ. of Denmark, Lyngby (Denmark). Lab. of Applied Mathematical Physics
Coherence and chaos phenomena in josephson oscillators for superconducting electronics. Final report, 21 May 1988-21 January 1989, 14:42902 (R;DK)

Technische Hochschule Aachen (Germany, F.R.)
HTR-2000: Computer program to accompany calculations during reactor operation of HTGR's, 14:41987 (R;DE;In German)
Investigation of kinematic demixing of polymer blend deuterated polystyrene (d-PS) and polyvinylmethylether (PVME) with neutron small angle scattering, 14:42591 (R;DE;In German)
The influence of carbide precipitation on the creep rupture behaviour of high temperature alloys, 14:42459 (R;DE;In German)

Technische Hochschule Aachen (Germany, F.R.). Lehrstuhl und Inst. fuer Siedlungswasserwirtschaft
Framework concept for an integrated system covering sewage treatment, sewage sludge disposal, waste incineration, flue gas purification, flue gas scrubbing water treatment, 14:42388 (R;DE;In German)

Technische Hogeschool Delft (Netherlands). Dept. of Mathematics and Informatics Computer Science
Vector-processing performance on the Delft Parallel Processor, 14:44376 (R;NL)

Technische Univ. Berlin (Germany, F.R.). Inst. fuer Fahrzeugtechnik
Supplementary measures to reduce emissions on a medium-sized passenger vehicle. Final report. Pt. 1, 14:42407 (R;DE;In German)

Technische Univ. Berlin (Germany, F.R.). Inst. fuer Landschaftsoekonomie
Appropriate technology and land use planning. The example of a site suitability evaluation for irrigation with wind-pump systems in four cooperatives in the greenbelt of Maputo/Mozambique, 14:41896 (R;DE;In German)
Site study at Angonia in Mozambique. An investigative study to judge the potential for an irrigation agriculture with special consideration of the use of window-pump systems, 14:41897 (R;DE;In German)

Technische Univ. Muenchen, Garching (Germany, F.R.). Inst. fuer Radiochemie
Characterization of reference and site specific humic acids. Contribution to the interlaboratory comparison exercise of the 'COCO-Club' in the CEC project MIRAGE II, Pt. 1: Characterization, 14:42741 (R;DE)
Complexation of americium with humic acid. Contribution to the interlaboratory comparison exercise of the 'COCO-Club' in the CEC project MIRAGE II, Pt. 2: Complexation, 14:42881 (R;DE)

Technischer Ueberwachungs-Verein Norddeutschland e.V., Hamburg (Germany, F.R.)
Evaluation of data recordings of documentation systems in nuclear power plants (SABA). Final report, 14:42082 (R;DE;In German)

Techno Scientific, Downeview, ON (Canada)
Development of portable test equipment employing ultrasonic pulse-echo technique to determine flaws in concrete. Final report, 14:43009 (R;CA)

Technology Univ. of Malaysia, Kuala Lumpur (Malaysia)
Application of nuclear techniques in the petroleum industry, 14:41507 (R;MY)

TECOGEN, Inc., Waltham, MA (USA)
Advanced desiccant-cooling-system development. Desiccant wheel sample performance testing. Topical report, January 1987-May 1988, 14:42315 (R;US)

Temple Univ., Philadelphia, PA (USA). Dept. of Physics
Mixed-valent and heavy fermions and related systems: Second technical progress report, [May 1987–June 1988], 14:44043 (R;US)

Tennessee Valley Authority, Norris, TN (USA). Engineering Lab.
Estimates of macrodispersivity based on analyses of hydraulic conductivity variability at the MADE [Microdispersion Experiment] site: Interim report, 14:43488 (R;US)

Texas A and M Univ., College Station, TX (USA). Dept. of Physics
Hyperfine structure and isotope shift measurements of short-lived elements by laser spectroscopy: Final report, 14:43763 (R;US)

Texas Office of the Governor, Austin, TX (USA)
Characterization of oil and gas reservoir heterogeneity: Status report, 14:41506 (R;US)

Texas Tech Univ., Lubbock, TX (USA). Dept. of Mathematics
Calculation of the optical power profile for a solar bowl with an iris, 14:41875 (R;US)

Texas Univ., Austin, TX (USA). Center for Transportation Research
Investigation of concrete coating problems. Final report, 14:42596 (R;US)

Texas Univ., Austin, TX (USA). Fusion Research Center
Equilibrium and stability studies for an iron-core tokamak with a poloidal divertor, 14:44193 (R;US)
Plasma position stability studies for TEXT-Upgrade, 14:44194 (R;US)

Texas Univ., Richardson, TX (USA). Center for Space Sciences
Electrodynamics of the high-latitude ionosphere. Technical report, 14:43747 (R;US)

Three-D Geoconsultants Ltd., Fredericton, NB (Canada)
Evaluation of New Brunswick shale oil for its potential as an asphalt feedstock, 14:41633 (R;CA)

Tokyo Univ., Tanashi (Japan). Inst. for Nuclear Study
Acceleration performance of a 50-MHz split coaxial RFQ and the design of a 25.5-MHz prototype, 14:43103 (R;JP)
Alpha decays of ^{221}Pa and ^{218,219}Ac, 14:43931 (R;JP)
Broad range spectrometer PIK for medium-energy meson spectroscopy, 14:43208 (R;JP)
Double compactification, 14:43725 (R;JP)
Medium-energy spectrometer (PIK) and study of Λ hypernuclei via (π^+, K^+) reactions, 14:43883 (R;JP)
Pion-transfer reaction spectroscopy for deeply bound π^- states, 14:43836 (R;JP)
Production of nuclear fragments in high-energy nuclear collisions, 14:43882 (R;JP)
Structure and formation of deeply bound pionic atoms, 14:43884 (R;JP)

Tokyo Univ., Tokai, Ibaraki (Japan). Nuclear Engineering Research Lab.
Report of the research results with University of Tokyo, Nuclear Engineering Research Laboratory's Facilities in fiscal 1987, 14:42074 (R;JP;In Japanese)

Toronto Univ., ON (Canada). Centre for Building Science
Performance evaluation of the dynamic wall house, 14:42321 (R;CA)

Transducer Research, Inc., Naperville, IL (USA)
Construction and testing of electrochemical NO_2 PSDs, 14:43361 (R;US)

Tromsoe Univ. (Norway). Auroral Observatory
Optical studies of the magnetospheric cusp from svalbard. Technical report, 30 September 1987-29 September 1988, 14:43735 (R;NO)

U

UKAEA Culham Lab., Abingdon (UK)
Review of the available modelling of mixing in subcooled water, 14:42040 (R;GB)

UKAEA Harwell Lab. (UK). Environmental and Medical Science Div.
Development of a computer program to determine the pulse-height distribution in a gamma-ray detector from an arbitrary geometry source -feasibility study, 14:43167 (R;GB)
Optimisation by simulated annealing and an optimal strategy for retrofit flue gas desulphurisation in the United Kingdom, 14:41921 (R;GB)

UKAEA Harwell Lab. (UK). Materials Development Div.
Effects of radiation on intermediate-level waste forms. 1987 annual report, 14:42582 (R;GB)
Electrochemical ion-exchange/sorption for medium active liquid waste treatment. Annual progress report 1988, 14:41700 (R;GB)

Umweltbundesamt, Berlin (Germany, F.R.)
Determination of concentration fields generated by vehicle emissions in different types of urban streets, 14:42413 (R;DE;In German)
Present and future development in noise control of heat pumps, 14:42322 (R;DE;In German)
Supplementary measures to reduce emissions on a medium-sized passenger vehicle. Final report. Pt. 1, 14:42407 (R;DE;In German)

Unit Tenaga Nuklear, Bangi, Selangor (Malaysia)
Calibration of instrument and personnel monitoring in radiological protection, 14:43169 (R;MY)
Nuclear instrument maintenance and technical training in Nuclear Energy Unit, 14:43170 (R;MY)
Radiation protection in the application of ionizing radiation in industry, 14:43604 (R;MY)

United Kingdom Nirex, Ltd., Harwell (UK)
Biosphere: current status, 14:41734 (R;GB)
Sorption of radionuclides on geological samples from the Bradwell, Elstow, Fulbeck and Killingholme site investigations, 14:43449 (R;GB)

United Technologies Research Center, East Hartford, CT (USA)
Investigation of plasma processes in electronic-transition lasers. Final report, 1 January 1985-31 December 1988, 14:42936 (R;US)

University Coll., Cardiff (UK). Dept. of Physics
Optimisation of the figure of merit of modified silicon-germanium alloys. Final technical report, 1987-1989, 14:42436 (R;GB)

University of North Texas, Denton, TX (USA)
Application of accelerators in research and industry '88: Proceedings: Part 1, 14:43045 (B;NL)
Application of accelerators in research and industry '88: Proceedings: Part 2, 14:43046 (B;NL)

Utah Univ., Salt Lake City, UT (USA)
Coal surface control for advanced fine coal flotation: Quarterly report No. 2, January 1–March 31, 1989, 14:41411 (R;US)
Effectiveness factors for hydroprocessing of coal and coal liquids: Progress report No. 7, March 15, 1989–June 15, 1989, 14:41428 (R;US)

Utah Univ., Salt Lake City, UT (USA). Coll. of Engineering
Ordered structures and metastable alloys grown by OMVPE, 14:42446 (R;US)

Utility Resource Associates, Rockville, MD (USA)
Evaluation of discrepancies in assembly cross-section generator codes: Volume 1: Final report, 14:41957 (R;US)
Evaluation of discrepancies in assembly cross-section generator codes, Volume 2: Final report, 14:41958 (R;US)

V

Valtion Teknillinen Tutkimuskeskus, Espoo (Finland)
Corrosion of high-alloy stainless steels in the marine environment, 14:42469 (R;FI)
Creep damage analysis of an old steam piping by using the replica technique, 14:41920 (R;FI;In Finnish)
Furnaces in the metal industry, 14:42378 (R;FI;In Finnish)
Heat transfer to and ignition of ceiling by impinging diffusion flame, 14:42324 (R;FI)
Major hazards in industrial processes, 14:43674 (R;FI;In Finnish)
Measurement of the bending wave power flow by the structural intensity technique, 14:42323 (R;FI)

Vanderbilt Univ., Nashville, TN (USA)
Pilot internship program on radioactive waste at Vanderbilt University: Progress report, September 1, 1987 to August 31, 1988, 14:41708 (R;US)

Versar, Inc., Columbia, MD (USA)
Evaluation of dissolved oxygen monitoring locations and flow patterns below Conowingo Dam, 14:41830 (R;US)

Versuchsgrubengesellschaft m.b.H., Dortmund (Germany, F.R.)
Systems for locating buried persons. Final report, 14:41499 (R;DE;In German)

Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (USA). Dept. of Anaerobic Microbiology
Enzymological studies of one-carbon reactions in the pathway of acetate utilization by methanogenic bacteria: Progress report, June 1, 1987–May 31, 1989, 14:41801 (R;US)

Virginia Univ., Charlottesville, VA (USA)
Formation and stability of aluminum-based metallic glasses in Al-Fe-Gd alloys, 14:42428 (R;US)
Mechanical properties of aluminum-rich Al-Fe-Gd metallic glass, 14:42430 (R;US)

Virginia Univ., Charlottesville, VA (USA). Dept. of Physics
Experiments on the nuclear interactions of pions and electrons: Progress report, 14:43875 (R;US)

W

Wardrop (W.L.) and Associates Ltd., Winnipeg, MB (Canada)
Ethanol from potato wastes, 14:41806 (R;CA)

Washington Univ., Seattle, WA (USA). Dept. of Atmospheric Sciences
Cloud and precipitation scavenging process in the South Coast Air Basin. Final report, 14:43379 (R;US)

Washington Univ., St. Louis, MO (USA). Dept. of Physics
[Non-empirical interatomic potentials for transition metals, alloys, and semiconductors]: Annual progress report, 1988–1989, 14:43764 (R;US)

Welding Inst. of Canada, Oakville, ON (Canada)
The design, construction and commissioning of a wide plate test facility. Final report, 14:43011 (R;CA)
West Valley Nuclear Services Co., Inc., West Valley, NY (USA)
Design, construction, and operation of the contact size reduction facility at the West Valley Demonstration Project, 14:41705 (R;US)
West Virginia Univ., Morgantown, WV (USA)
Inferring bubble size distributions from resistance probe measurements in gas-liquid, gas-slurry and three phase systems, 14:41802 (R;US)
West Virginia Univ., Morgantown, WV (USA). Dept. of Chemistry
Electron-transfer reactions of coal model compounds. Final report, January 1986-August 1988, 14:41450 (R;US)
West Virginia Univ., Morgantown, WV (USA). Dept. of Mathematics
Problems in dynamic phase transition. Final report, 1 September 1987-30 September 1988, 14:43795 (R;US)
Western Canada Water and Sewage, Calgary, AB (Canada)
Proceedings of the [35th annual] western Canada water and sewage conference, 14:43024 (R;CA)
Proceedings of the [36th annual] western Canada water and sewage conference, 14:43027 (R;CA)
Western Kentucky Univ., Bowling Green, KY (USA). Dept. of Chemistry
Thermodynamics of the solvent swelling of coal: Progress report, March 1, 1989–May 31, 1989, 14:41447 (R;US)
Westinghouse Electric Corp., Pittsburgh, PA (USA). Research and Development Center
Superconducting oxide films for multispectral infrared sensors. Final report, 1 January-31 December 1988, 14:42492 (R;US)
Westinghouse Hanford Co., Richland, WA (USA)
Balanced magnetic switch selection, installation, and operation guide, 14:41777 (R;US)
Base calibration of Pacific Northwest Laboratory's gross gamma borehole geophysical logging system, 14:41767 (R;US)
Decision process involved in preparing the Shippingport reactor pressure vessel for transport, 14:41770 (R;US)
PORFLO-3: A mathematical model for fluid flow, heat, and mass transport in variably saturated geologic media: Users manual, Version 1.0, 14:41746 (R;US)
Status of ground water in the 1100 area, 14:41748 (R;US)
Westinghouse Hanford Company effluent report for 300, 400, and 1100 Area operations for calendar year 1988, 14:41747 (R;US)
Westinghouse Savannah River Co., Aiken, SC (USA)
Forest land application of sewage sludge on the Savannah River Plant, 14:41842 (R;US)
Wisconsin Univ., Madison, WI (USA)
Stellarator Transport Theory, 14:44191 (R;US)
The SLD [SLC Large Detector] calorimeter systems, 14:43242 (R;US)
Wisconsin Univ., Madison, WI (USA). Water Resources Center
Management functions for effective controls of ground-water contamination. Technical completion report, 14:43500 (R;US)
Wisconsin Univ., Milwaukee, WI (USA). Center for Urban Transportation
Market-based transit-facility design. Final report, 14:42333 (R;US)
Wiss, Janney, Elstner and Associates, Inc., Northbrook, IL (USA)
Corrosion protection of prestressing systems in concrete bridges. Final report, 14:42594 (R;US)
Woods Hole Oceanographic Institution, MA (USA)
Extremely thermophilic fermentative archaebacteria of the genus desulfurococcus from deep-sea hydrothermal vents. Technical report, 14:41885 (R;US)
Hydrocarbons in surface sediments from a Guaymas Basin hydrothermal vent site. Technical report, 14:41884 (R;US)
Wyoming Univ., Laramie, WY (USA). Dept. of Physics and Astronomy
Ground-based infrared observations of sources discovered by the AFGL, FIRRSE and IRAS infrared surveys. Final report, 15 July 1984-14 July 1987, 14:43720 (R;US)

X

XENERGY, Inc., Burlington, MA (USA)
A statewide, least-cost plan for Rhode Island: Final report on the initial work of the Rhode Island least-cost planning committee, 14:42270 (R;US)
Technology options and potential for energy savings for Rhode Island least-cost planning project: Final report, 14:42271 (R;US)

Y

Yale Univ., New Haven, CT (USA). Dept. of Chemical Engineering
Catalytic combustion of methane. Annual report, May 15, 1987-May 15, 1988, 14:41616 (R;US)
Yuill (G.K.) and Associates Ltd., Winnipeg, MB (Canada)
Investigation of the indoor air quality, airtightness, and air infiltration rates of a statistically random sample of 78 houses in Winnipeg, 14:43353 (R;CA)

Personal Author Index

Authors' surnames are indexed in the form appearing in the publication cited; given names generally have been reduced to initials. For documents with multiple authors, each author name is indexed. The entry for a primary author (first author listed on an abstracted document) includes the full document title and citation number. Entries for other authors provide a cross-reference to the primary author. Also included is information on the document type, country of publication, and the document language listed in parentheses in the format (J;FR;In French and English). Accent marks are not input because of computer alphabetization. Spelling and transliteration follow standard conventions.
